**TO LOCOMOTIVE AND MARINE ENGINE BOILER BUILDERS.** Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

**MORRIS TASKER & MORRIS,**  
Warehouse S. E. corner 3d and Walnut Sts., Philadelphia. 114

**PATENT INDESTRUCTIBLE WATER**

Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York.

**J. BALL & CO.**

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee  
**G. A. NICOLLS,**  
ja45 Reading, Pa.

**RAILROAD IRON.—THE SUBSCRIBER'S** New Rail Iron Mill at Phoenixville, Pa., is expected to be ready to go into operation by the 1st of September, and will be capable of turning out 30 to 40 tons of finished Rails per day. They are now prepared to receive orders to that extent, deliverable after the 1st of October next, for heavy rails of any pattern now in use, equal in quality and finish to best imported.

**PIG IRON.**—They are also receiving weekly 150 to 200 tons of No. 1 Phoenix Foundry Iron, well adapted for light castings.

**REEVES, BUCK & CO.,**  
45 North Water St., Philadelphia,  
or by their Agent, **ROBT. NICHOLS,**  
284 79 Water St., New York.

**THE SUBSCRIBERS, AGENTS FOR** the sale of  
Codorus,  
Glendon,  
Spring Mill and  
Valley, } Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

**SAM'L KIMBER & CO.,**  
59 North Wharves,  
Jan. 14, 1846. [1y4] Philadelphia, Pa.

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolser of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mill) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

**RAILROAD IRON.—THE NEW JERSEY** Iron Company, Boonton, N. J., are now preparing to make Railroad Bars, and are ready to take orders or make contracts for Rails, deliverable after the first of December next. Apply to

**FULLER & BROWN, Agent,**  
No. 139 Greenwich, corner of Cedar street.  
September 18, 1846. 10:39 41f

**LAWRENCE'S ROSENDALE HYDRAULIC** Cement. This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floods, and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight papered barrels, by **JOHN W. LAWRENCE,**  
143 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 23 17

**ENGLISH PATENT WIRE ROPES.—FOR THE USE OF MINES, RAILWAYS, ETC.—** for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

**ALFRED L. KEMP,**  
75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed.]

**WILLIAM ROE, Sup't of Power.**

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed.] **G. A. NICOLL,**

Sup't Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed.]

**T. L. SMITH,**

Jersey City, November 4, 1845.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

Jamaica November 12, 1845.

[Signed.]

**JOHN LEACH,**

Sup't Motive Power.

**RICH & CO'S IMPROVED PATENT SALAMANDER SAFES.**

Warranted free from dampness, as well as fire and thief proof.

Particular attention is invited to the following certificates, which speak for themselves:

**TEST No. 10.**

*Certificate from Mr. Silas C. Field, of Vicksburg, Mississippi.*

On the morning of the 14th ult., the store owned and occupied by me in this city, was, with its contents, entirely consumed by fire. My stock of goods consisted of oil, rosin, lard, pork, sugar, molasses, liquors, and other articles of a combustible nature, in the midst of which was one of Rich's Improved Patent Salamander Safes, which I purchased last October of Mr. Isaac Bridge, New Orleans, and which contained my books and papers. This safe was red hot, and did not cool sufficiently to be opened until 16 hours after it was taken from the ruins. At the expiration of that time it was unlocked, when its contents proved to be entirely uninjured, and not even discolored. I deem this test sufficient to show that the high reputation enjoyed by Rich's Safes is well merited.

S. C. FIELD.

**TEST No. 11.—Certificate.**

By the fire which occurred in this village on the 27th July last, our Law Office, together with many other buildings, was destroyed—we had in our office one of Rich's Improved Patent Salamander Safes, which, though heated red hot, preserved, without being the least damaged, many papers valuable to our clients—the envelopes of a few papers being slightly scorched. Some twenty-four hours after the fire, the safe was removed, and so hot was it, that several hours were required for it to cool off. Our office was in the second story of a large brick building, all the wood used in construction of said house being pitch pine. While the safe was red hot, one of the walls tumbled in, and so injured the lock that it was necessary to break the door open. From this test, we feel no hesitancy in recommending "Rich's Patent Salamander Safe" as entirely fire proof.

GOREE & KING.

Marion, Ala., Sept. 15th, 1846.

*Still other Tests in the Great Fire of July 19, 1845.*

The undersigned purchased of A. S. Martin, No. 138½ Water street, one of Rich's Improved Patent Salamander Safes, which was in our store, No. 54 Exchange place. The store was entirely consumed in the great conflagration on the morning of the 19th inst. The safe was taken from the ruins 52 hours after, and on opening it, the books and papers were found entirely uninjured by fire, and only slightly wet—the leather on some of the books was perched by the extreme heat.

RICHARDS & CRONKHITE.

Benton, Miss., December 27, 1845.

One of Rich's Improved Salamander Safes, which I purchased on the 2d of June last of A. S. Marvin, 138½ Water street, agent for the manufacturer, was exposed to the most intense heat during the late dreadful conflagration. The store which I occupied, No. 46 Broad street, was entirely consumed; the safe fell from the 2d story, about 15 feet, into the cellar, and remained there 14 hours, and when found, I am told, and from its appearance afterwards, should judge that it had been heated to a red heat. On opening it, the books and papers were found not to have been touched by fire. I deem this ordeal sufficient to confirm fully the reputation that Rich's safe has already obtained for preserving its contents against all hazards.

(Signed.)

WM. BLOODGOOD.

New York, 21st July, 1845.

Reference made to upwards of nine hundred and fifty merchants, cashiers, brokers, and officers of courts and counties, who have Rich's Safe's in use.

The above safes are finished in the neatest manner, and can be made to order at short notice, of any size and pattern, and fitted to contain plate, jewelry, etc. Prices from \$50 to \$500 each. For sale by

A. S. MARVIN, General Agent,

138½ Water st., N. Y.

Also by Isaac Bridge 76 Magazine street, New Orleans.

Also by Lewis M Hatch, 120 Meeting street Charleston, S. C.

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

TO THOSE INTERESTED IN Railroads, Railroad Directors and Managers are respectfully invited to examine an improved SPARK ARRESTER, recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger and freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Supt Hartford and New Haven Railroad; W. R. McKee, Supt Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Supt New Jersey Railroad Trans. Co.; J. Elliott, Supt Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Supt Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Supt Macon Railroad, Macon, Ga.; J. H. Cleveland, Supt Southern Railroad, Monroe, Mich.; M. F. Chittenden, Supt M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckley & Drury, Boston, will be promptly executed.

FRENCH & BAIRD.  
Philadelphia, Pa., April 6, 1844.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

••• The letters in the figures refer to the article given in the Journal of June, 1844. ja45

**PATENT HAMMERED RAILROAD, SHIP**

and Boat Spikes. The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed.

JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y. The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merritt, New York; J. H. Whitney, do.; E. J. Etting, Philadelphia; Wm. E. Coffin & Co., Boston. ja45

**MACHINE WORKS OF ROGERS,**

Ketchum & Grosvenor, Patterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR, ja45 Paterson, N. J., or 60 Wall street, N. York. ty

**PATENT RAILROAD, SHIP AND BOAT**

Spikes. The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

••• Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

ja45

**SPRING STEEL FOR LOCOMOTIVES,**

Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1½ to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,

Albany Iron and Nail Works,

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

### THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.	
4,224 Timbers, 11 ft. long, 3 x 6 inches =	68,696 ft. b.m., at \$10 = \$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	4,403 ft. b.m., at \$13 = 57 34
13,000 Spikes = 2,250 lbs. at 4½ cts =	101 25
Workmanship free of patent charge.....	600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

**JAMES HERRON.**

Civil Engineer and Patentee.

Leave Reading at 6 A.M. and 1½ P.M.

**MEDFORD BRANCH TRAINS.**

Leave Boston at 7½, 11½ A.M., 2½, 5½, 7 P.M.  
Leave Medford at 6½, 8 A.M., 11, 4½, 6 P.M.

The Depot in Boston is on Haymarket Square.

Passengers are not allowed to carry Baggage above \$50 in value, and that personal, unless notice is given, and an extra amount paid, at the rate of the price of a Ticket for every \$500 additional value.

11y31 CHAS. MINOT, Super't.

## SUMMER ARRANGEMENT.—NEW YORK AND ERIE RAILROAD LINE, from April 1st until further notice, will

run daily (Sundays excepted) between the city of New York and Middletown, Goshen, and intermediate places, as follows:

FOR PASSENGERS—  
Leave New York at 7 A.M. and 4 P.M.

" Middletown at 6½ A.M. and 5½ P.M.

FARE REDUCED TO \$1.25 to Middletown—way in proportion. Breakfast, supper and berths can be had on the steamboat.

FOR FREIGHT—  
Leave New York at 5 P.M.

" Middletown at 12 M.

The names of the consignee and of the station where to be left, must be distinctly marked upon each article shipped. Freight not received after 5 P. M. in New York.

Apply to J. F. Clarkson, agent, at office corner of Duane and West sts. H. C. SEYMOUR, Sup't.

March 25th, 1846.

Stages run daily from Middletown, on the arrival of the afternoon train, to Millford, Carbondale, Honesdale, Montrose, Towanda, Owego, and West; also to Monticello, Windsor, Binghamton, Ithaca, etc., etc. Agent on board.

13th

## NORWICH AND WORCESTER RAILROAD.

Summer Arrangement, commencing Monday, April 6, 1846.

Accommodation Trains, daily, except Sunday. Leave Norwich, at 6 a.m., and 4 p.m. Leave Worcester, at 10 a.m., and 4½ p.m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston, and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 1½ p.m. train from Boston.

New York Train via Long Island Railroad: Leave Allyn's Point for Boston, about 1 p.m., daily, except Sunday.

Leave Worcester for New York, about 10 a.m., stopping at Webster, Danielsonville, and Norwich.

New York Train via Steamboat—Leave Norwich for Boston, every morning, except Monday, on the arrival of the steamboat from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 4½ p.m., daily, except Sunday, stopping at Webster, Danielsonville and Norwich.

Freight Trains daily each way, except Sunday. Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are Less when paid for Tickets than when paid in the Cars.

J. W. STOWELL, Sup't

### TROY RAILROADS.—IMPORTANT NOTICE.

Troy and Greenbush Railroad, forming a continuous track from Boston to Buffalo and Saratoga Springs. This road is now, and laid with the heaviest iron rail. Trains will always be run on this road connecting at Greenbush each way with the trains to and from Boston and intermediate places, leaving Greenbush daily at 11 p.m. and 6 p.m., or on arrival of the trains from Boston; leave Troy at 7 a.m. and 4 p.m., or to connect with trains to Boston.

Trains also run hourly on this road between Troy and Albany. Running time between Greenbush and Troy, 15 minutes.

### TROY AND SCHENECTADY RAILROAD.

This road is laid its entire length with the heaviest iron rail— which is not the fact with the road from Albany. Trains will always be run on this road connecting each way, to and from Buffalo and intermediate places. Leave Troy for Buffalo at 7 a.m. and 1 p.m. and 6 p.m., or to connect with the trains for the west; leave Schenectady at 9 a.m., 8 a.m., 1 p.m. and 3 p.m., or on arrival of the trains from Buffalo and intermediate places.

### TROY AND SARATOGA RAILROAD.

#### THE ONLY DIRECT ROUTE.

No change of passenger, baggage or other cars on this route. Cars leave Troy for Ballston, Saratoga Springs, Lake George and White Hall at 7 a.m., (arriving one hour in advance of the train from Albany,) and at 3 p.m. Returning, leave Saratoga at 9 a.m. and 3 p.m., (reaching Troy in time for the evening boats to New York.) Cars also leave Troy for the Burrough at 3 p.m. and 7 p.m., connecting with packet boats for the north. This takes passengers from New York and Boston to Montreal in 44 hours.

N.B. Travellers will find the routes through Troy most convenient and economical, and as expeditious as any other. The steamboats to and from New York land within a few steps of the railroad office, and passengers are taken up and landed by the different railroad lines at the doors of principal hotels, thus saving all necessity for, and annoyance from, hack drivers, cabmen, runners, etc.

Aug. 3, 1846. 1y 32

### BALTIMORE AND OHIO RAILROAD.

MAIN STEM. The Train carrying the Great Western Mail leaves Bal-

timore every morning at 7 and 10 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburgh and Hancock, connecting daily each way with the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Pittsburgh. Time of arrival at both Cumberland and Baltimore 5 1/2 P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pittsburgh \$10, and time about 32 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$12. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

#### WASHINGTON BRANCH.

Daily trains at 9 A. M. and 5 P. M. and 12 at night from Baltimore and at 6 A. M. and 5 P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. 13y1

### MANUFACTURE OF PATENT WIRE

Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tilters etc., by JOHN A. ROEBLING, Civil Engineer, Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition. 3y19 1y

### BALTIMORE AND SUSQUEHANNA

Railroad.—Reduction of Fare. Morning and Afternoon Trains between Baltimore and York.

The Passenger trains run daily, except Sunday, as follows: Leaves Baltimore at..... 9 a.m. and 3 p.m. Arrives at..... 9 a.m. and 6 p.m. Leaves York at..... 5 a.m. and 3 p.m. Arrives at..... 12 p.m. and 8 p.m. Leaves York for Columbia at..... 1 p.m. and 8 a.m. Leaves Columbia for York at..... 6 a.m. and 2 p.m.

Fare to York..... \$1 50  
" Wrightsville..... 2 00  
" Columbia..... 2 12 1/2  
Way points in proportion.

### PITTSBURG, GETTYSBURG AND HARRISBURG.

Or via Lancaster by railroad..... 10  
Through tickets to Harrisburg or Gettysburg..... 3  
In connection with the afternoon train at 3 o'clock, a horse car is run to Green Spring and Owning's Mill, arriving at the Mills at..... 5 1/2 p.m. Returning, leaves Owning's Mills at..... 7 a.m.

D. C. H. BORDLEY, Supt.  
31 ly Ticket Office, 63 North st.

### CENTRAL RAILROAD-FROM SAVANNAH TO MACON.

Distance 190 miles.

This Road is open for the transportation of Passengers and Freight.

Freight. Rates of Passage, \$8 00. Freight—  
On weight goods generally..... 50 cts. per hundred.  
On measurement goods..... 13 cts. per cubic ft.  
On brls. wet (except molasses and oil)..... \$1 50 per barrel.  
On brls. dry (except lime)..... 80 cts. per barrel.  
On iron in pigs or bars, castings for mills, and unboxed machinery..... 40 cts. per hundred.  
On hdds. and pipes of liquor, not over 120 gallons..... \$5 00 per hhd.  
On molasses and oil..... \$6 00 per hhd.  
Goods addressed to F. WINTER, Agent, forwarded free of commission. THOMAS PURSE, Gen'l. Supt. Transportation.

### NEW YORK & HARLEM RAILROAD

CO.—Winter Arrangement.

On and after Monday, November 23, 1846, the cars will run as follows:

Leave 27th street for 42d street, Deaf and Dumb Institute, Yorkville, Harlem Morrisania, and Williams' Bridge, at 7 o'clock a.m. From City Hall for above named places, 9 p.m. [freight train,] 9 30 p.m. 5 p.m. to Morrisania only.

Leave City Hall for Harlem, Morrisania, Fordham and Williams' Bridge, at 7 45 a.m., and 10 45 a.m.; 1 15 p.m., 2 p.m. [freight train,] 3 30 p.m. and 3 45 p.m.

Leave City Hall for Hunt's Bridge, Bronx, Tuckahoe, Hart's Corners White Plains, Davis' Brook, Unionville and Pleasantville, [Pleasantville 4 miles from Sing Sing,] 7 45 and 10 45 a.m.; 1 15 p.m., 2 p.m. [freight train,] and 3 45 p.m.

#### RETURNING.

Leave Pleasantville, at 8, 10, [freight train,] and 11 a.m.; 1 20, and 4 p.m.

Leave White Plains, at 8 12, 10 30, [freight train] and 11 20 a.m.; 1 50, and 4 20 p.m.

Leave Tuckahoe, 8 35, 10 55, [freight train,] and 11 35 a.m.; 2 05, and 4 35 p.m.

Leave Williams' Bridge at 7 45, 8 50 and 11 50 a.m.; 2 10, 4, and 4 50 p.m.

Leave Morrisania 8 and 9 05 a.m.; 12 05, 2 35, 4 20, 5 05 and 6 p.m.

Leave Yorkville, at 8 15 a.m.; 4 35 and 6 15 p.m.

#### SUNDAY ARRANGEMENTS.

Leave City Hall for Pleasantville and intermediate places, at 7 45 a.m.; 1 15 and 3 p.m.

Leave Pleasantville for City Hall, at 8 a.m.; 11, and 3 15 p.m.

Leave City Hall for Williams' Bridge and intermediate places, 10 45 a.m.; 2 30 p.m.

Leave Williams' Bridge for City Hall, at 8 50 and 11 50 a.m.; 1, 3 45 and 4 05 p.m. 1y49

### PHILADELPHIA, WILMINGTON & BALTIMORE RAILROAD.—1847.

Whole Arrangement.

Philadelphia for Baltimore..... 6 a.m. and 4 p.m.  
Baltimore for Philadelphia..... 9 a.m. and 8 p.m.

Connecting in Baltimore with Mail Lines south and west, as per notice of the Baltimore and Ohio Railroad—and with Mail Lines north from Philadelphia, both morning and afternoon.

Sundays, the Morning Lines do not run in either direction.

Accommodation train from Wilmington to Philadelphia, leaves Wilmington at 8 a.m., and returns at 2 p.m. J. R. THOMAS, Engineer and General Superintendent.

### GEORGIA RAILROAD. FROM AUGUSTA TO ATLANTA—171 MILES.

AND WESTERN AND ATLANTIC RAILROAD FROM ATLANTA TO OOTHICALOGA, 80 MILES.

This Road in connection with the South Carolina Railroad and

Western and Atlantic Railroad now forms a continuous line, 388 miles in length, from Charleston to Oothicaloga on the Oostenaula River, in Cass Co., Georgia.

#### RATES OF FREIGHT.

		Between Augusta and Oothicaloga, 250 miles.	Between Charleston and Oothicaloga, 388 miles.
1st class.	Boxes of Hats, Bonnets, and Furniture, per cubic foot.....	\$0 16	\$0 26
2d class.	Boxes and Bales of Dry Goods, Sadlery, Glass, Paints, Drugs and Confectionary, per 100 lbs.	1 00	1 50
3d class.	Sugar, Coffee, Liquor, Bagging, Rope, Cotton Yarns, Tobacco, Leather, Hides, Copper, Tin, Feathers, Sheet Iron, Hollow Ware, Castings, Crockery, etc.	0 60	0 85
4th class.	Flour, Rice, Bacon, Pork, Beef, Fish, Lard, Tallow, Beeswax, Bar Iron, Ginseng, Mill Gearing, Pig Iron, and Grindstones, etc.	0 45	0 70
	Cotton, per 100 lbs.....	0 45	0 65
	Molasses, per hogshead.....	8 50	13 50
	" " barrel.....	2 00	3 25
	Salt per bushel.....	0 17	
	Salt per Liverpool sack.....		95
	Ploughs, Corn Shellers, Cultivators, Straw Cutters, Wheelbarrows.....	0 75	1 37

German or other emigrants, in lots of 20 or more, will be carried over the above roads at 2 cents per mile.

Goods consigned to S. C. Railroad Co. will be forwarded free of commissions. Freight may be paid at Augusta, Atlanta, or Oothicaloga.

J. EDGAR THOMSON,

Ch. Eng. and Gen. Agent.

Augusta, Sept. 2d, 1846. 44 1y

### THE WESTERN AND ATLANTIC

Railroad.—This Road is now in operation to Oothicaloga, a distance of 80 miles, and connects daily (Sundays excepted) with the Georgia Railroad.

From Kingston, on this road, there is a tri-weekly line of stages, which leave on the arrival of the cars on Tuesday, Thursday and Saturday, for Warrenton, Huntsville, Decatur and Tusculumbia, Alabama, and Memphis, Tennessee.

On the same days, the stages leave Oothicaloga for Chazanooga, Jasper, Murfreesborough, Knoxville and Nashville, Tennessee.

This is the most expeditious route from the east to any of these places.

CHAS. F. M. GARNETT,

Chief Engineer.

Atlanta, Georgia, April 16th, 1846. 1y1

**CENTRAL AND MACON AND WESTERN RAILROADS, Ga.**—These Roads with the Western and Atlantic Railroad of the State of Georgia, form a continuous line from Savannah to Oothcaloga, Ga., of 371 miles, viz:

Savannah to Macon—Central Railroad ..... 190  
Macon to Atlanta—Macon and Western ..... 101  
Atlanta to Oothcaloga—Western and Atlantic... 80  
Goods will be carried from Savannah to Atlanta and Oothcaloga, at the following rates, viz:

	To Atlanta	To Oothcaloga
On Weight Goods—Sugar, Coffee, Liquor, Baggins, Rope, Butter, Cheese, Tobacco, Leather, Hides, Cotton Yarns, Copper, Tin, Bar & Sheet Iron, Hollow Ware & Castings.....	\$0 50	\$0 75

Freight may be paid at Savannah, Atlanta or Oothcaloga.

F. WINTER, Forwarding Agent, C. R. R.  
Savannah, Aug. 15th, 1846.

**GREAT SOUTHERN MAIL LINE, VIA** Washington City, Richmond, Petersburg, Weldon and Charleston, S. C., direct to New Orleans. The only Line which carries the Great Southern Mail, and Twenty-four Hours in advance of Bay Line, leaving Baltimore same day.

Passengers leaving New York at 4 P.M., Philadelphia at 10 P.M., and Baltimore at 6 A.M., proceed without delay at any point, by this line, reaching Richmond in eleven, Petersburg in thirteen and a half hours, and Charleston, S. C., in two days from Baltimore.

Fare from Baltimore to Charleston.....\$31 00  
" " " " Richmond.....6 60

For Tickets, or further information, apply at the Southern Ticket Office, adjoining the Washington Railroad Office, Pratt street, Baltimore, to  
STOCTON & FALLS, Agents.

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Elliotts' Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 30 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Elliott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLIOTT & ABBOTT.  
Factory, 9th street, near Coates, cor. Melon st.  
Office, No. 3 North 6th street,  
Philadelphia, Pa.

**LITTLE MIAMI RAILROAD, OPEN** TO SPRINGFIELD—Distance 84 miles—connecting at Xenia and Springfield with Messrs. Neil, Moore, & Co's. daily daylight lines of stages going east and north, to Columbus, Zanesville, Wheeling, Cleveland, and Sandusky City, via Urbana, Bellefontaine, Kenton, and the Mad river and Lake Erie railroad, or Columbus, Delaware, and the Mansfield and Sandusky City railroad—forming, by these connections, the cheapest and most expeditious route to Buffalo, Niagara Falls, Rochester, Albany, New York, and Boston.

On and after Thursday, August 13, 1846, until further notice, a Passenger train will run as follows: Leave Cincinnati daily at 9 A. M., for Milford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Old Town, Yellow Springs, and Springfield.  
Returning, will leave Springfield at 4 hours 36 minutes A. M. A line of Hacks runs in connection with the Cars, between Deerfield and Lebanon.

Fare—From Cincinnati to Lebanon.....\$1 00  
" " " " Xenia.....1 50  
" " " " Springfield.....2 00  
" " " " Columbus.....4 00  
" " " " Sandusky City 8 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company, on East Front street.

Further information and through tickets for the Stage lines, may be procured at H. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at of a passage for every \$500 in value over that amount.

The 11 P. M. train from Cincinnati, and the 2 40 P. M. train from Xenia, will be discontinued on and after Monday, the 10th instant.

A freight train will run daily.  
W. H. CLEMENT, Supt.

**SOUTH CAROLINA RAILROAD.—A** Passenger Train runs daily from Charleston, on the arrival of the boats from

Wilmington, N. C., in connection with trains on the Georgia, and Western and Atlantic Railroads, and by stage lines and steamers connects with the Montgomery and West Point, and the Tusculum Railroad in N. Alabama.

Fare through from Charleston to Montgomery daily.....\$26 50

Fare through from Charleston to Huntsville, Decatur and Tusculum.....22 00

The South Carolina Railroad Co. engage to receive merchandize consigned to their order, and to forward the same to any point on their road; and to the different stations on the Georgia and Western and Atlantic railroad; and to Montgomery, Ala., by the West Point and Montgomery Railroad.

JOHN KING, Jr., Agent.

**RAILWAY IRON.—THE BEST QUALITY** of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by  
DAVIS, BROOKS & CO.,  
Jan. 2 [10] 68 Broad St., New York.

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

THOMAS & EDMUND GEORGE,  
445 N. E. cor. 12th and Market sts., Philad., Pa.

**RAILROAD IRON.—THE SUBSCRIBER'S** New Rail Iron Mill at Phoenixville, Pa., is expected to be ready to go into operation by the 1st of September; and will be capable of turning out 30 to 40 tons or finished Rails per day. They are now prepared to receive orders to that extent, deliverable after the 1st of October next, for heavy rails of any pattern now in use, equal in quality and finish to best imported.

**PIG IRON.**—They are also receiving weekly 150 to 200 tons of No. 1 Phoenix Foundry Iron, well adapted for light castings.

REEVES, BUCK & CO.,  
45 North Water St., Philadelphia,  
or by their Agent, ROBT. NICHOLS,  
75 Water St., New York.

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee  
G. A. NICOLLS,  
Reading, Pa.

**THE SUBSCRIBERS, AGENTS FOR** the sale of Codorus, Glendon, Spring Mill and Valley, Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

SAM'L KIMBER & CO.,  
59 North Wharves,  
Jan. 11, 1846. [14] Philadelphia, Pa.

**RAILROAD IRON.—THE "MONTGOMERY"** Iron Company, Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to  
MURDOCK, LEAVITT & CO.,  
Agents.

148 77 Pine St., New York.

**RAILWAY IRON.—DAVIS, BROOKS** & Co., No. 68 Broad Street, have now in port on Ship-board, 200 Tons of the best English heavy H Rails, 60 lbs. to the lineal yard, which they offer for sale on favorable terms, also, about 6 to 700 Tons now on the way, to arrive shortly, of the same description of Rail.

**PIG AND BLOOM IRON.—THE SUBSCRIBERS** are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by  
A. WRIGHT & NEPHEW,  
Vine St. Wharf, Philadelphia.

**THE SUBSCRIBER IS PREPARED TO** execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip,  
New York.

## NORRIS' LOCOMOTIVE WORKS.

BUSH HILL, PHILADELPHIA, Pennsylvania.

PASCAL IRON WORKS.

## WELDED WROUGHT IRON TUBES

From 4 inches to 4 ft in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T, L, and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by **MORRIS, TASKER & MORRIS,** Warehouse S. E. Corner of Third & Walnut Streets, PHILADELPHIA.

**T**O LOCOMOTIVE AND MARINE ENGINE Boiler Builders. Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

**MORRIS TASKER & MORRIS,** Warehouse S. E. corner 3d and Walnut Sts., Philadelphia.

**P**ATENT INDESTRUCTIBLE WATER Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits. This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 113 Fulton street, New York.

J. BALL &amp; CO.

**Baltimore and Pittsburgh.**

The *Baltimore American* of March 17, contains the following brief sketch of matters relating to a subject which just now occupies the attention of many of our readers—and we give the article entire—without comment at present. The *American* says:

When the Baltimore and Ohio railroad was first projected no definite terminus was fixed upon, either in Virginia or Pennsylvania—the great object in view being the construction of a road to the Ohio river. The route beyond the confines of Maryland, was undetermined. In order, however, to secure a choice of routes for future selection, or for branching to different points, the States of Virginia and Pennsylvania were applied to for the privilege of carrying the road through their respective territories. The privilege was granted in each State with the utmost liberality. Virginia allowed the road to strike the Ohio at any point above the mouth of the little Kanawha; Pennsylvania opened her territories to the road in view of its termination at Pittsburg.

When the limitations of time designated by these Acts had respectively expired, the road by reason of various difficulties not having been so completed, a less liberal disposition prevailed both in Virginia and Pennsylvania towards the work. The former State refuses the right of way except to one point, and that is conceded under conditions which have decided the company to reject it at once and again. Pennsylvania, also, when requested in 1839 to renew the privileges formerly granted, took occasion to load the renewal with such restrictions and provisos as to render its acceptance impossible.

Closed out from both States the city of Baltimore, if left to her own resources, might have to wait long before an available route to the Ohio would be at her disposal. But it so happens that the city of Pittsburg has secured a charter by which an unobstructed way is obtained from Cumberland, the present terminus of the road, to the Ohio river at Pittsburg—and the facilities of this charter are proffered to the Baltimore company.

Now when it is remembered that the original enterprize of the company contemplated the construction of a road to the Ohio river, without reference to any ascertained route, or definite point of termination, it would seem that the main object aimed at is placed within the company's reach by this proffer on the part of Pittsburg. It will not do to say that Pittsburg was never looked to as one of the desirable points on the Ohio at which the road might be happily terminated. The fact is otherwise. The Pittsburg route has been explored by the company's engineers; and not only explored—it has been found to be the shortest route from Cumberland to the Ohio; more than that, it has been found to be the cheapest route. The distance from Cumberland to Pittsburg is 144 miles; and the respective distances from Cumberland to other points on the Ohio are thus set down: to Wheeling, through Pennsylvania, 176 miles; through Virginia, 205 miles; to Fishing Creek, 196 miles; to Parkersburg 223 miles.

Such are the respective distances from Cumberland to the points designated, as reported by B. H. LATROBE, Esq., the company's chief engineer, in 1845. The route then to Pittsburg, as compared with the route through Virginia to Wheeling, the only southern route now open to the company, is 61 miles shorter; and according to Mr. LATROBE's estimate of the expense of construction and operation, it is less expensive by some \$6,000,000. "It has been shown," says Mr. LATROBE, in his report in 1845, when the Virginia law of that year relative to the Wheeling route was under consideration by the company, only to be promptly rejected—"it has been shown that to construct and work the road from Cumberland to Pittsburg would cost about \$6,000,000 less than to Wheeling through Virginia on the route indicated by the law, and nearly \$4,000,000 less than to the mouth of Fishing creek. To secure the advantages of the Fishing creek terminus it is not doubted would be worth this additional 4,000,000, but it is equally unquestioned that to reach the Wheeling terminus would not be worth the difference of 6,000,000; so that if the choice were between Pittsburg and Wheeling through Virginia, the former should be preferred; and while there is any prospect of obtaining sooner or later, from Pennsylvania the right to make it upon acceptable terms, the route now exacted by the Virginia law should not be adopted."

The right to make the road to Pittsburg upon acceptable terms is obtained from Pennsylvania; the privilege is now at the company's option; the only alternative route to the Ohio is the one to Wheeling which was rejected in 1845, and which Mr. LATROBE says should not be adopted while there is any prospect of obtaining sooner or later, from Pennsylvania the right to make the road upon acceptable terms to Pittsburg.

The cost of construction from Cumberland to the Ohio with double track, and operation with a trade of 150,000 passengers and 60,000 tons of freight per annum, upon the several lines on which estimates have been made, are stated by Mr. LATROBE in round numbers thus:

	Construction, actual cost.	Working, equiv. cap.	Total.
1. To Pittsburg.	\$5,481,707	6,124,581	11,606,288
2. To Wheeling, thro' Penn.	6,771,236	7,770,262	14,541,498
3. To Wheeling, thro' Va.	8,348,832	9,295,274	17,644,106
4. To F. Creek.	7,170,250	8,273,315	15,443,565

It thus appears that if the choice of all routes to the Ohio were open to us, the route to Pittsburg would be the shortest and the cheapest; and that, as compared with the route to Wheeling, through Virginia (the only alternative route within our reach) it is cheaper on the aggregate by some \$6,000,000.

The serious question now presents itself to the Baltimore and Ohio railroad company and to this community and presses for a special answer, whether we shall devote all our means and efforts to the prosecution of the road to the Ohio by the shortest and cheapest of all the routes, or suffer the road to stop

where it now is, at Cumberland, in the vague expectation that at some indefinite time the Legislature of Virginia may open the way to a terminus at Fishing creek. Is it not better to go at once to Pittsburg? We can there have a terminus to rest upon; and when, in the enjoyment of a lucrative trade from that source, the Legislature of Virginia shall invite us to extend our road to a southern terminus at any point above the Little Kanawha, we will have it in our power to demand terms from Virginia in the shape of a liberal appropriation for the work. The people of North-western Virginia will do this; and we can leave them to take their own time.

**Railroad to Pittsburg.**

The following extracts will give some idea of the state of feeling existing in regard to the road from Baltimore to Pittsburg: we find them in the *Pittsburg papers*—and a good deal of concern seems apparent there, in reference to the turn affairs have taken finally! The committee have responsible duties before them, as will be seen. A late number of the *Baltimore American* says:

Our community is awaiting with profound interest the result of the proceedings of the Committee appointed on Monday last at the meeting of the Stockholders of the Baltimore and Ohio Railroad Company. It is a subject of very general regret that the Committee did not proceed to Pittsburg, in conformity with the instruction of the Stockholders: the expectation being confident and, we think, well founded, that personal intercourse, maintained on both sides in a frank and friendly spirit, would accomplish, surely and happily, the object of restoring good feeling, and a hearty co operation in the consummation of a purpose of deep concern to both cities.

We observe that the Pittsburg and Connellsville Stockholders' meeting was to take place on Friday, and not Thursday. What disposition was made of the letter of the Baltimore Committee we have yet to learn. The following extracts from Pittsburg papers go to show the importance of having the Committee present there in person:

From the *Pittsburg Gazette*.

A Committee has been appointed by the Baltimore Stockholders, who will probably reach here in time for the meeting of our Stockholders on Friday. These gentlemen will of course be received with all the courtesy and kindness which their personal character, as well as the importance of their mission, require at our hands; but we hope there will be no official negotiation with them, unless they come clothed with power to contract a permanent alliance, such an one as will have a binding effect upon the Baltimore company. We have had enough of committees going to and fro, and long-winded negotiations, and in the end have been further from a consummation than when we commenced. We can as well close the matter now as six months or a year hence, and if there is any disposition on the part of the Baltimore company to do so, it will be done.

From the *Pittsburg Journal*.

A committee has been appointed to visit Pittsburg, for the purpose of coming to a

conclusion in regard to the Connellsville route. The committee is composed of gentlemen whose characters for honor and integrity is undoubted: one of them has been long and well known to us. We hope that they will be received and treated with marked attention, and without any allusions calculated to hurt their pride or feelings. Let our conduct to them be in such strong contrast to theirs towards us, as to make them carry hence with them a lasting impression of our true greatness and magnanimity. We should remember, that we owe one debt to Baltimore, one that should make us pass over many faults, and that is the "determination of Philadelphia to build the Central railroad"—without the rivalry of Baltimore, the old Quakers of the City of Brotherly Love, would never have extended their vision beyond the Schuylkill. Baltimore has done us this kindness, and we thank her for it—and we may also thank her for not giving us a chance to precipitate ourselves too deeply into the stock of the Connellsville railroad. The surplus capital of Pittsburg will find ample employment in the construction of the Western railroad.

The Pittsburg Commercial Journal, of Saturday, has the following account of the proceedings of the meeting of the Stockholders of the Pittsburg and Connellsville road held in that city on Friday last:

The meeting of the Stockholders of the Pittsburg and Connellsville railroad yesterday in Philo Hall, was very numerous attended.

The meeting was organized by Mr. Eichbaum taking the chair; Dr. E. D. Gazzam acting as secretary.

A number of sets of resolutions were offered, and the prospects and present condition of the company discussed with much ability by Messrs. Wm. Robinson, Jr., Loomis, Larimer, Graft, Craig, Ebbs, Darsie, Denny, Bigham, Bakewell, Gazzam, and others.

The Hon. Andrew Stuart, of Fayette, being present, on motion of Col. Robinson, he was requested to address the meeting. Mr. S. complied in a few very neat and highly practical remarks. Another gentleman from Fayette, whose name we did not hear, also made some remarks, and submitted a series of resolutions.

Mr. Bigham explained his views in relation to the project of a western railroad, in his usual animated style.

Mr. Darsie expressed his conviction that the right of way for a western road, and a charter for the purpose could readily be obtained from the company.

Mr. Loomis eloquently argued in favor of the advantages offered us in the west, as superior to those of the east, by Baltimore. His speech was characterized by such great good sense, and a ready perception of all the points in the case, that it made a very marked impression on the meeting.

After a long discussion as to the mode in which the overtures of the Baltimore and Ohio company should be regarded, the proposition of Dr. E. D. Gazzam was adopted

for the appointment of a committee to take the various propositions into consideration, and report to an adjourned meeting of the stockholders, to be held at Philo Hall this afternoon at 3 o'clock.

Messrs. Gazzam, Bakewell, Robinson, Ebbs, and Darsie were appointed on the committee.

**Fifteenth Annual Report of the Boston and Worcester Railroad Corporation.**  
*To the Honorable Senate and House of Representatives:*

The Directors of the Boston and Worcester railroad respectfully submit the Fifteenth Annual report of their proceedings, in compliance with the requisitions of their charter.

The business of the road has been successfully prosecuted during the year without interruption and without serious accident. There has been a large increase in the transportation of passengers and merchandise, compared with that of the most productive of the preceding years. Five passenger trains and two or more freight trains have run in each direction daily, except on Sundays, over the whole road, and an equal number of additional passenger trains have run, over the part of the road which terminates in the city. The frequency, regularity and rapidity of the trains, with their safety and convenience and the moderate rate of charge for passage and freight, are such as to command a large amount of public patronage, and at the same time, decided expressions of the public approbation. The power obtained from this, and other works of a similar character, of rapid and easy communication from the centre to the extremities of the State, has become one of the main elements of the public prosperity.

The directors, as trustees both for the public and for the large number of the stockholders of this corporation, on the occasion of presenting their annual statement exhibiting the successful operations of the road, feel justified in thus alluding to its public benefits, for the purpose of reminding the Legislature that, while the projectors of these very expensive works have realized their hope of a fair income from the capital invested in them, which constituted one of the motives for soliciting the authority of the Legislature to undertake them, so also the expectation of benefit to the public, in promoting, in various ways, the welfare of the Commonwealth, which constituted another and stronger motive, has been even more signally realized. The corporations established for these purposes, with a liberal grant of powers from the Legislature, have accomplished all, and more than all, which they promised for the public benefit, as the inducements for the grant of these powers.

This corporation is authorized, by an act in addition to its charter, for the greater accommodation of persons residing near the route of their railroad, to construct branch railroads to any part of the towns thro' which the main road passes, or of the towns adjoining. In pursuance of this authority, the corporation, in the year 1838, in compliance with the request of the inhabitants of Milbury,

constructed a branch railroad, which is a little more than three miles in length, leading to that town.

In the year 1845, on the application of the inhabitants of Saxonville, the directors commenced the construction of a branch, four miles in length, leading from Natick to that place. This branch was completed in the following year, and it has been since in regular use. In the year which has just passed, on the application of the inhabitants of Newton Lower Falls, the directors caused a branch railroad to be constructed, leading along the valley of Charles river to that place, which has been recently completed, and regular passenger trains now run between Boston and the Lower Falls village.

Early in the same year, the directors received an urgent application, from a large number of the inhabitants of Holliston, Milford, and some of the adjoining towns, to build a branch railroad leading to those towns. The length of the route here proposed is about 12 miles, and the heavy cost which it will involve demanded of the directors a deliberate consideration of the proposition, before they decided upon it. On full examination of the question, having ascertained that a favorable route could be obtained—that a large and thriving population were in want of the accommodation, and that they came directly within the scope of the provision in the additional act above referred to—finding, also, that the branch might be advantageously extended to the towns of Mendon, Blackstone and Woonsocket, in case the Legislature should authorize it to be done—they resolved on undertaking it. A branch road was accordingly definitely located, passing through a part of the towns of Sherburne and Ashland, and the centre of Holliston, and terminating near the centre of Milford. All parts of the line are now under contract for grading and masonry, and it is intended that the road shall be completed within the ensuing summer. Although there is no reason to anticipate that the increased business which will be afforded by the branch will, for the present, afford a full remuneration for the additional expenditure required, it was believed by the directors, to be for the interest of the corporation, to give this proof of its disposition to extend the benefits of their road to all persons who can reasonably demand accommodation from it, within the limits of the authority granted to them.

At the period of the commencement of the Saxonville branch, the directors were requested, by the inhabitants of the central village of Framingham, to extend the branch to that place. After a careful examination of the question, with the aid of the necessary surveys, they declined it, on the ground that, in their opinion, the inhabitants of the central village might be more effectually accommodated, by means of a shorter and less expensive branch, leading directly from the convenient and central station of the main road, at South Framingham, where it would connect with the trains running in each direction; than by the proposed circuitous branch leading from Natick through Saxonville, and

over ground less favorable. They, therefore, expressed a willingness to build the direct branch, in case it should be requested, but declined building the other. No such request has yet been made; but, on a recent application of a number of the inhabitants of the village, the question of the best mode of affording them the accommodation which they require, is now undergoing a revision, by the aid of further surveys, with a view to a decision upon it early in the ensuing season.

With a view to the adoption of a more convenient mode of uniting this road, at Worcester, with the Western, and Norwich and Worcester railroads, and also of establishing a connection between each of these roads and the Providence and Worcester, as well as the Nashua and Worcester roads, which are now in progress of construction, at a central point in the town of Worcester, by means of stations in the vicinity of one another, or by one station for the accommodation of the five railroads, the directors in pursuance of an informal understanding, between them and the directors of each of those roads, have taken the initiatory measures for the accomplishment of this object. To facilitate the execution of this purpose, the inhabitants of Worcester, by a resolution passed with great unanimity in town meeting, have authorized a material alteration of two of the streets, in a central part of the town, near the present passenger station of this and the Norwich and Worcester roads. The directors hope, in return for this obliging compliance of the town with their request, to be able to carry into effect an arrangement, which will as effectually promote the public convenience, as it will the advantage of the several corporations whose roads will thus be united at a single point, and in a central and the best adapted part of the town. For accomplishing this object in the manner proposed, it will be necessary to erect a new building, of sufficient dimensions to contain, in distinct apartments, the local trains of the several roads, as well as the trains which may pass through the principal routes, and also to afford suitable accommodations for passengers leaving or about to enter the respective trains.—For the completion of this arrangement, the concurrence and co-operation of the five corporations will, of course, be required.

Since the date of the last annual report, an agreement has been made, with the directors of the Western railroad corporation, for the adjustment of all matters in controversy between the two corporations, which were referred to, in that and in former annual reports. As a condition of this agreement, the petition of that corporation, which was presented to the Legislature at its last session, praying for its interposition in the support of certain claims resisted by this corporation, and also a petition of the said corporation, which was pending in the Supreme Judicial Court, for the appointment of commissioners to determine rates of compensation for the transportation of passengers and freight, were both withdrawn. The agreement is founded on the principle, that the two corporations possess equal powers and rights under their re-

spective charters, and it adopts regulations for the conducting of the joint business, and rules for the partition of the passage fares and freight, earned on the joint line of transportation, which were mutually satisfactory to the directors of the two roads, the latter taking effect from the commencement of the fiscal year then begun. Under these rules and regulations, the joint business has been successfully conducted during the past year; and it is believed that they have had the effect not only of sustaining all the just rights, but of promoting, in a very satisfactory manner, the interests of both corporations.

The directors have persevered in the purpose of substituting for the old rail of the first track, which was laid down in 1833, 1834 and 1835, and was of a weight of 40 lbs. per yard, a much stronger rail, weighing 63 lbs. per yard, and corresponding, in weight and form, with that of which the second track of this road is constructed. This measure had become necessary, or highly expedient, in consequence of the great weight of the engines and cars lately introduced upon the road.—The passenger and freight engines now principally used, and adapted to the dimensions of the trains now transported, are of nearly double the weight, of those which were required on the first opening of the road. At an early period of the last season, 13 miles of the improved track had been laid, and, during the subsequent part of the year 1100 tons of rails—a quantity sufficient for 11 additional miles of track—were imported, for the purpose of being immediately laid down. The establishment of the new tariff of duties, by which a reduction was made of about \$10 a ton in the duty on railroad iron entered after the 1st of December, offered a sufficient inducement for making a deposit of the iron in the custom house stores, until after that date.

This caused a delay in the laying down of these rails; but the necessary preparation having been previously made, by the removal of the old rails and the supply of gravel for the improvement of the road bed where necessary, the work has been prosecuted, under some disadvantages, during the winter. This work is not yet finished. An additional quantity of 900 tons of heavy rails has been contracted for in England, to be delivered early in the next summer. This will be sufficient, with what is now on hand, to complete the improved track, with the heavy rails, for a length of 33 miles, leaving but 11 or 12 miles to be completed in another year. The old rail is of sufficient strength for light engines and loads, and is well adapted for the branch roads, on which heavy engines are not required.

The subjoined statement contains the items of information required by law, to be embraced in the annual return, so far as they are exhibited by the books of the corporation. The details of expenditure in the construction and equipment of the road, as charged in the books, have not been entered under so many distinct heads of account as are specified in the recent act of the Legislature. The cost is therefore stated, in the annexed schedule,

under a classification conforming with that under which the books of account have been kept.

In the returns also of current expenses, a slight departure from the form prescribed in the printed schedule has been rendered necessary, from the manner in which these expenditures are charged in the books. Under the several heads of repairs, whether of road bridges, engines or cars, are entered all expenditures not only for repairs strictly speaking, but for new constructions, improvements, or additions; unless the additions so made exceed in value the deterioration of the property under that head, beyond the amount which represents it in the general stock; in which case, the excess charged to the appropriate head of the general account, and the residue to repairs. For this purpose, an estimate is made, as nearly as is practicable, before the closing of each year's accounts, of the property under each head of account, and of the amount of depreciation beyond the repairs, in comparison with the additions. The several heads of current expenditures for repairs, therefore, in all cases, include additions to the stock under the above limitation.

As the items embraced in the prescribed form of return do not embrace all the descriptions of property of the corporation, so as to exhibit the balance of its assets and liabilities, the following recapitulation, embracing the additional items, is subjoined, viz:—

Original cost of road and equipment, with that of additions when the amt exceeds in value that of depreciation, as given in the annexed schedule.	\$3,485,232 43
Cash, notes receivable, shares in stock of the corporation, stock acct, including rails not laid down, fuel, oil, stock of car building, machine, and repair shops, etc.	338,697 60
	3,823,930 05
<b>Liabilities, viz:</b>	
Capital stock	3,500,000 00
Debts, including divid's. unclaimed, Dec. 1, '46.	154,204 25
	3,654,204 25

Balance of net profits undivided, Dec. 1 1846.	169,725 80
Dividend of 4 per cent. subsequently declared payable Jan. 1, 1847.	140,000 00
Surplus not divided	29,722 86

With these explanations, the undersigned hereto subjoin the return required by law, which is respectfully submitted.

Nathan Hale, Daniel Denny, Eliph. Williams, Nathaniel Hammond, Benjamin F. White, John Hathaway, Abraham T. Lowe, Samuel Greele.

Boston, Jan. 26, 1847.

SUFFOLK ss. Boston, Jan. 29th, 1847.—Then personally appeared the above-named Nathan Hale, Eliphalet Williams, Nathaniel Hammond, Benjamin F. White, John Hathaway, Abraham T. Lowe and Samuel Greele, and severally made oath that the foregoing report, by them subscribed, is true, to the best of their knowledge and belief. Before me,

GEORGE BENIS,  
Justice of the Peace.

## Massachusetts Annual Railroad Reports.

Return of the Boston and Worcester Railroad, under the Act of April 16, 1846.

Capital stock.....	\$3,500,000
Increase of capital since last report.....	600,000
Capital paid in, per last report.....	2,900,000
Capital paid in since last report.....	600,000
Total amount of capital stock paid in.....	3,500,000
Funded debt, per last report.....	None.
Funded debt paid since last report.....	None.
Funded debt, increase of, since last report.....	None.

CHARACTERISTICS OF ROAD.	
Length of road.....	44½ miles.
Length of single track.....	44½ miles.
Length of double track.....	44½ miles.
Length of branches owned by the company, stating whether they have a single or double track:	
[Millbury 3 1-5, Saxonville 4, Newton 14 miles].....	8 9-20 miles.
Weight of rail per yard in main road.....	40 to 64 pounds.
Weight of rail per yard in branch roads.....	40 pounds.
Maximum grade, with its length in main road.....	30 feet for 14½ miles.
Maximum grade, with its length in branch roads.....	30 feet for 2½ miles.
Total rise and fall in main road.....	702 feet.
Total rise and fall in branch roads:	
[Millbury 62, Saxonville 63, Newton 15 feet].....	140 feet.
Shortest radius of curvature, with length of curve in main road.....	600 feet for 900 feet.
Shortest radius of curvature, with length of curve in branch roads.....	600 feet for 900 feet.
Total degrees of curvature in main road.....	1975 degrees.
Total degrees of curvature in branch roads:	
[Millbury 166, Saxonville 336, Newton 75 degrees].....	577 degrees.
Total length of straight line in main road.....	25-827 miles.
Total length of straight lines in branches:	
[Millbury 14, Saxonville 2, Newton 3-5 miles].....	4 7-30 miles.
Aggregate length of trestle bridges.....	350 feet.
Whole length of road unfinished on both sides.....	None.
DOINGS DURING THE YEAR.	
Miles run by passenger trains.....	195,692
Miles run by freight trains.....	93,008
Miles run by other trains.....	6,283
Total miles run.....	294,983

Number of passengers carried in the cars.....	470,319
Number of passengers carried one mile.....	12,766,522
Number of tons of merchandise carried in the cars.....	179,325
Number of tons of merchandise carried one mile.....	6,941,291
Number of passengers carried one mile, to and from other roads.....	6,485,873
Number of tons carried one mile, to and from other roads.....	5,171,661
Average rate of speed adopted for passenger trains, including stops.....	29 miles per hour.
Average rate of speed adopted for freight trains, including stops.....	9 miles per hour.
Estimated weight in tons of passenger trains, including engine and tender, but not including passengers, hauled one mile.....	2,565,301 tons, of 2000 lbs.
Estimated weight of merchandise trains, including engine and tender, but not including freight, hauled one mile.....	11,198,291 tons, do.
EXPENDITURES FOR WORKING THE ROAD.	
For repairs of road, maintenance of way, exclusive of wooden trestle bridges and renewals of iron.....	\$22,814 58
For repairs of trestle bridges.....	9,652 74
For renewals of iron, including laying down.....	12,132 00
For wages of switch-men, gate-keepers and flag-men.....	2,433 05
For removing ice and snow.....	411 95
For repairs of fences, gates, houses for flag-men, gate-keepers, switch-men, tool-houses.....	In general account of repairs.
Total for maintenance of way.....	
MOTIVE POWER.	
For repairs of locomotives.....	\$31,534 85
For new locomotives to cover depreciation.....	
For repairs of passenger cars.....	16,840 33
For new passenger cars to cover depreciation.....	
For repairs of merchandise cars.....	18,887 50
For new merchandise cars to cover depreciation.....	
For repairs of gravel and other cars.....	Small, and included in [repairs.
Total for maintenance of motive power.....	
MISCELLANEOUS.	
For fuel and oil, [fuel, \$50,226 93; oil, \$5,884 93].....	\$56,111 86
For salaries, wages and incidental expenses, chargeable to passenger department.....	39,505 41
For salaries, wages and incidental expenses, chargeable to freight department.....	45,879 63

AMERICAN RAILROAD JOURNAL.

Published by D. K. MINOR, 105 Chestnut St., Philadelphia.

Saturday, April 10, 1847.

Boston and Worcester Railroad.

The Fifteenth Annual Report of this road will be found in this number. In its details it is in the prescribed form required by the Legislature. We shall continue to publish these reports, in their new form, that they may hereafter be referred to for comparison.

Baltimore and Ohio Railroad Report.

We give, in this number, the remainder of this report, commenced in our last—and we give it in full, with all the tables—relating to the business of the year—which will be sure to arrest the attention of professional readers—especially the statement in relation to the comparative cost of working the road with a *plate*, or an *edge*, rail; and also statement C, or the detail for 1846. We shall give, in the next number, statement D—or the statement in detail for 1845—similar to that of D, for 1846—which was omitted last year.

The Late Storm.

Since our last number, a very serious storm has occurred, which occasioned much damage in New York, Philadelphia, Baltimore, etc. The magnetic telegraph lines, it appears, were extensively injured. Between Wilmington and thence eastward towards New York, the posts were blown down and the wires broken in various places. The line to Lancaster, Pa., was also much injured. The repairs of the several lines were commenced with energy, but several days elapsed before the communications were restored.

The injuries upon the line between Philadelphia and Baltimore, especially, were very considerable—and the "lightning talk" was broken off entirely for some days. In the mean time, important news from the army was received in Washington, which was communicated northward by the regular mails.

Table of Railroads in the United States.  
Correction of its Errors.

We are obliged to the writer of the following letter, for his early attention to our request for accurate information in relation to, or for the correction of, errors in our Table of American Railroads; and we shall esteem it a special favor if other gentlemen, having the means of correcting errors in other roads, will enable us, at an early day to make this table as correct as possible. It requires but little labor on the part of each to enable us to make it a document of great value to those interested in railroads. Yet, to make it accurate, up to the *present time*, it is important that we should be enabled to correct errors resulting from the lack of documents of a *recent date* in relation to some of the roads. We propose soon to issue another edition of the table—or at least as soon as we can obtain full returns.

"KEENE, March 25, 1847.

"Dear Sir—In your Table of 'Railroads in the United States,' I observe certain errors:

"15. The 'Cheshire' from 'State Line, Fitzwilliam, N. H.' This should be from Ashburnham, Mass., to Bellows' Falls. Length 53 miles, instead of 45—weight of rail 60 lbs.—T pattern.

"Length of Vermont and Massachusetts is 69 miles, instead of 65.

"Central road extends from Windsor, Vt. to Burlington, 117 miles.

"A new road should be added—the 'Sullivan'—extending from Cheshire, at Bellows' Falls, to Central at Windsor—length 25 miles.

"Respectfully yours,  
T. M. EDWARDS."

Railroads, Canals, etc.

The Northern New Hampshire railroad has been open for use to Franklin, a distance of 18 miles from Concord, during the last two months. It is expected that the cars will be running a further distance of 15 miles to North Andover by July next. It is expected that in the course of the year the whole road will be completed to the Connecticut river, and that within the same period the Central road in Vermont will be completed, from the Connecticut river to Montpelier. The receipts of income on the 18 miles of railroad already open, have exceeded \$8000 in the last two months, and the net receipts, after deducting expenses, are equal to a rate of 8½ per cent. per annum.

The Journal of Commerce states that the \$3,000,000 subscription to the capital stock of the Hudson River railroad having been completed on the 22d ult., the Directors yesterday made choice of Wm. Chamberlain for President; James Boorman, Vice President, and Treasurer pro tem.; J. M. Hopkins, Secretary; J. B. Jervis, Chief Engineer, and Fortune C. White, Land Commissioner. These are all very good appointments.

The New York correspondent of the Washington Union writes that, "the Directors of the Hudson River railroad are pushing forward the works with the best spirit. Two corps of engineers were to take the field on Saturday—one on this island, and the other in Westchester county, from the southern line of the county advancing northward. In a very few days a third corps will be at work in the Highlands. The road will go on as fast as possible, and its friends hope will be well nigh finished before its gainsayers are done croaking that it will never be commenced. Push on—room enough for all! No fear that we shall get too many railroads from this city."

The Knickerbocker will take her place at once upon the Norwich and Worcester line to Boston.—The Worcester will haul off to repair, and afterward, with the Knickerbocker, will form the summer line to Boston. These boats are both too well known to the public to require any commendation.

The Directors of the Terre Haute and Richmond railroad company had their first meeting on the 4th ult. at Terre Haute. The Board have determined to open books for the subscription of stock at an early day in April, at Terre Haute, Greencastle, Indianapolis and Richmond; and at St. Louis, Cincinnati, and other cities, as soon as the convention, which is to assemble in May next at Indianapolis, shall determine on the best plan of operations. This road across the State of Indiana, is intended as a link in the great chain of railway from the Atlantic by way of Baltimore and Philadelphia, to the Missouri river at St. Louis.

A mass meeting of the citizens of Penobscot,

Somerset, and Piscataque, was held at Dexter, Me., in reference to a railroad from the Kennebec to Bangor. Resolutions were adopted, declaring that in the opinion of the meeting, the time had come when a railroad from the Kennebec river to Bangor can be accomplished, and that the citizens between those rivers "can and will subscribe to the stock of the Penobscot and Kennebec railroad, the sum of \$200,000."

The Railroad Committee of the Massachusetts Legislature have reported a bill authorizing the Fitchburg railroad company, to extend their road into Boston and construct a depot on that side of the bridge. The authorities of the city, remarks the Traveller, as is known, remonstrated against this, chiefly from apprehension of danger to passengers over the Warren bridge, which bridge it is designed to use for the track. We understand, however, that it is contemplated to construct the railway so distinct from the bridge as to remove all reasonable grounds of apprehension. It is not only just that the Fitchburg railroad should enjoy equal advantages with the other railroad in this respect, but it is very desirable, as a matter of accommodation and convenience to travellers to and from the city, that the depot of that road should be located within the city. Boston can well afford to be liberal in extending accommodations to railroad companies. The bill in favor of the proposed depot passed its third reading unanimously, in the Senate on Wednesday.

We learn from the Baltimore American, that large numbers of boats are on their way down the Pennsylvania and Tide Water canals, laden with produce for the Baltimore market. The chain of works is said to be in good order, and a large business is anticipated.

The Tide Water canal is now fairly in operation, boats having arrived from Columbia. The Harre de Grace boats were loaded with lumber, and left for Baltimore in tow of the steamboat Wolcott.

The navigation of the Pennsylvania canal has been delayed by the unfinished state of a new aqueduct at Conewango Falls. The whole line is now in operation we learn, and a large business may be expected.

The Susquehanna river has been navigable for arks and rafts for some days, and a quantity of lumber has arrived at Port Deposit.

The Pottsville Miners' Journal, of Saturday, says, "the quantity of coal sent this week is 20,436-10 tons, making the total quantity sent this season 195,859-03 tons by railroad.

The subscriptions to the stock of the Pennsylvania Central railroad, amount to \$3,037,650 or 60,753 shares.

The railway share market closed, in Boston, on Saturday, at the following quotations:

		Offered.	Asked.
Lowell Railroad par \$500.....		580	590
Nashua do. 100.....		1284	130
Concord do. 50.....		684	69
Fitchburg do. 100.....		123	134
Worcester do. 100.....		116	117
Western do. 100.....		1004	101
Maine do. 100.....		1094	1104
Providence do. 100.....		104	1044
Eastern do. 100.....		107	1074
Portland do. 100.....		1004	1014
Old Colony do. 100.....		984	99

The Courier adds—These solid securities are like gold dust in the market, and are always sure of commanding the needful, on hypothecation, with a reasonable margin between the amount loaned and the current price of the stock. Railroad property, of the dividend class, is the best endorser which a business man can possibly have.

About \$75,000 have been subscribed on the Cape for the branch railroad to Cape Cod.

The feeling in favor of railroads in Maine is still on the advance; and meetings are called in every section of that State, having for their object, the extension of railroad facilities. We are glad to see that there is no disposition to flag, in regard to the projects already under way there—while new proposals, and new routes are constantly being pressed upon the consideration of capitalists in that region.

#### The Telegraph System.

The late storms seem to have produced havoc among the lines of telegraph. In every direction they have been thrown down, and in at least one case, where they have been constructed along lines of railroads, a serious accident has been occasioned to a train, attended, we believe, with loss of life, in consequence of the locomotive having been entangled in the wires of the telegraph, which had been broken, and thrown down by the gale.

These accidents, coupled with the frauds previously perpetrated on the public, by the cutting of the wires, on the arrival of steamers from England, show something wrong in the present system, and a few suggestions on the subject, it seems to us, may not be out of place.

It appears to us, that the plan of the agent of Mr. Morse, and his associates, (Mr. Amos Kendall) for deriving the maximum profit, from the improvement, is calculated to lead to a most imperfect system. It is generally understood that Mr. Kendall refuses to sell the patent on any route, or to allow its use on any terms, other than on the condition of the patentees, having as a consideration for the use of the patent, *one-half* the stock, or property, in any line on which it may be used. The exaction of this enormous *bonus* deters prudent men, who perceive that it must necessarily lead to other plans of telegraph being introduced, from embarking capital to any extent in lines so organized. As a consequence, the lines are, we understand, in some cases, undertaken by persons of very limited means, who are induced to subscribe by contractors engaged to raise the subscriptions, on condition of being employed to put up the telegraphs at a specified sum per mile, usually much above the fair value of the work.—The temptation is, of course, a very great one to the contractor to expend as little as possible, and to put up these lines in the cheapest and frailest manner—and thus, while the capital stock issued for each of these lines, under this system of double *bonus*, is about *fourfold* their actual cost—the lines themselves are of the most imperfect character. In some cases, where leave has been had of the railroad companies, they are taken along lines of railroad; in other cases along common roads; but the permission, when they are taken along railroads, has been usually given by the railroad companies subject, at any time, to be revoked on short notice, and we do not hear of any instance in which arrangements have been made with the railroad companies for the prompt repair of the telegraphs when out of order, or for giving to the lines of telegraph the benefit of the police of the railroad companies, which might be so invaluable, for their protection.

But a further objection to the whole system is, that imperfect as it is, it has become a *monopoly* of the closest kind, and threatens to be one of a *monstrous* character. Some two or three, or a small number of individuals, of whom Mr. Kendall is the co-partner and agent, owning, under this system, *one-half* the stock, have the absolute control of all the telegraphs in the United States, with the power of tax-

ing, to any extent, the transmission of intelligence, *however imperfectly the duty may be performed.*

We have a high opinion of the character of Professor Morse, and of the value of his improvement, and would be glad to see the most liberal reward accrue to him from his invention, but we are satisfied he has been ill-advised as to the best mode of using his patent, and that he is not on the plan to make it most valuable to himself or the public.

No one ever heard before of an inventor refusing to sell his patent, and requiring as the consideration for its use, not only half the profits to accrue from it during the existence of the patent, but half the property on which it was to be applied. It is as if Oliver Evans had exacted as a condition of the use of patent mill gleaning, half the estate in mills in the United States; or as if the inventor of a patent plough should require as a condition of using it, the conveyance of an undivided moiety of the farms on which it might be employed, and of the profits of its cultivation.

As a necessary consequence, it becomes of great moment to the public—if Professor Morse and his associates continue to refuse to sell the patent right to his improvement, that some other plan of telegraph should be introduced, and we have little doubt, with the ingenuity and science directed to the subject, that other plans must, ere long, be introduced, as valuable, if not more so than that of Mr. Morse.

We would make, under these circumstances, a suggestion to the railroad companies throughout the country, in relation to this matter. Their interest is, in a measure, connected with it, and they are, in our opinion, the parties who can make the system most useful to the public, and most profitable to the proprietors of the right.

It is, it seems to us, the true policy of the railroad companies, and also due to the public, that they should not aid in fastening the present, or any other similar monopoly upon the country, by giving to any telegraph company a right to put up its posts and wires on its line; but that they should construct and keep in order, when adequate inducements may be offered, by any telegraph company, a line of posts, with one or more wires, reserving the right to make use of the posts hereafter for other lines or plans of telegraph; and to place on them as many wires as the business of the country may require. The advantage of this system is, that while the railroad tracks would be encumbered with only a single set of posts, and the risk of accidents from them be proportionably diminished, an opening would be made for the largest possible competition hereafter, in the conveyance of intelligence, whether on one or many plans. The public and the railroad companies, would both gain by the arrangement. The former in having better telegraphs, guarded, and kept in better order, and operated by competing companies, the latter in profits which they would derive from the rent of wires to, or a share in the operations of, several companies instead of one, while they would have only the expense of keeping in order single lines of posts and wires, an object obviously much better effected by the railroad companies than by any other agency.

If we mistake not, on some such plan the telegraph system—which is now a subject of great complaint in many cases—may be made a source of great convenience and value to the public, and of handsome profit, to railroad companies. Under such a system, it seems to us, we should have better telegraphs, kept constantly in working order, and abundant wires for the proper dispatch of intelligence, while the agents and numerous hands along the lines of

railroads, would protect the common posts and wires of the different lines of telegraph (and necessarily all equally) against injury. As it is, while the charges are now so high as to prevent the use of the telegraphs, except on business of great importance, they are made the instruments of frauds on the public, are frequently out of order, inadequately provided with wires, and, instead of being constantly watched, and repaired, in case of accident, in a fraction of an hour, as they would be, if owned, and kept in order by the railroad companies—days, and sometimes nearly a week elapses, before the place where comparatively a slight injury has occurred, is ascertained and repaired.

We throw out these suggestions, in the hope that the subject—one of vast and growing importance—may receive proper attention, before the present monopolizing system shall have gained a foothold so firmly, that others equally—perhaps more—deserving, may not have a fair chance, and, also, that the public may have the benefit of fair competition in the use of the wires, while all parties will have the advantage of the unceasing vigilance of the numerous persons employed by railroad companies in keeping them in constant working order. We shall refer to this subject again.

#### Railroad from Philadelphia to Pittsburgh.

We have repeatedly been questioned of late, touching our opinion in reference to a railroad from this city to Pittsburgh, and the inquiries have been made with regard to our views of the route proposed by the friends of the Great Central road, as compared with that by way of the West Branch, hence to the Ohio river. By reference to back numbers of the "Journal," our opinions upon this question will be found freely and candidly expressed; as we have endeavored, in times past, to give our views, generally, upon this, as upon all other questions which we have conceived to come legitimately within the scope of our province, in an unprejudiced and impartial manner; and have at all times, to say the least, spoken without any self-interestedness.

We have, however, differed somewhat from many others, from the outset, in relation to the route which should be adopted for a railroad from Philadelphia to Pittsburgh; believing that it should be laid through a region—if such an one can be found, equally favorable—not already accommodated with an easy and cheap means of transportation; and we still see no reason to change our opinion on the subject—as it is a principle with us to advocate measures which will give the greatest amount of accommodation to the greatest number of people, for the least possible judicious investment of capital. The entertainment of these views, does not, however, prevent us from taking a deep and abiding interest in the early construction of the "Central" road.

Of the entire feasibility of the Central route, we do not entertain a doubt—any more than we do of the right of those who furnish the capital to accomplish the object, to designate the general route to be pursued.

The present favorable aspect of affairs in regard to this route, and the well-known reputation of those who have lately been elected to manage its concerns, is, we think, sufficient guarantee that the "Central" road is in a fair way, and will be pushed forward as earnestly as is possible; and therefore any speculations as to the ultimate general result of the undertaking, are unnecessary. The names of the gentlemen selected to conduct its affairs for the present year, is ample warrant of judicious management; and we entertain no doubt, if the Board of Directors is as fortunate in the selection of its Engineers, as the Stockholders have been in their

choice of officers, that a good road will be soon be commenced, and completed at an early day.

Our conviction is, then—in reference to the *Central* route—that at no time since the subject was first broached, has the prospect been so good as it now seems, for its construction. The scheme has been before the public a sufficient length of time, for all its advantages to be brought out and thoroughly canvassed—and the few objections which have, from time to time, been urged against it, have also been leisurely and carefully considered. Capitalists have been found to subscribe liberally and promptly for the stock—the people of this city, through their representatives, have sanctioned the enterprise, and the *Central road will be built; and time will show whether we judge rightly in the prediction that it will prove a highly profitable investment to its stockholders, and a means of communication from the Ohio river to the Atlantic—such as does not now exist in this country—all things considered.* To the city of Philadelphia, more especially, we believe it will prove a source of benefit, now incalculable; and on its completion we shall witness an increase in the commercial prosperity of this city and state, hitherto unprecedented in our local history. Thus much, briefly, for the *Central route*.

In these remarks in relation to the *Central* road, we do not in the least intend to change our ground in relation to the importance of a road up the "*West Branch*," and to the lake at Erie, because we deem it of the utmost importance to this city. On the contrary, we are fully convinced that the completion of the *Central* road will ensure the construction of the *Northern*; and we would therefore recommend to its friends the propriety of a steady, untiring effort to push it forward, without regard to the *Central* line—bearing in mind the fact that the citizens of Philadelphia have decided in relation to that work, and that they are able, and will soon be willing, to construct the *Northern* line also.

There are many careful, cautious business men, we are well aware, who honestly doubt the construction of even one railroad to the western waters, and they are, in their wisdom, sure that, if it should be built, it will "never pay"—that is, it will never yield a fair interest on the investment of capital—while we are as well convinced that it will be with great difficulty that we can construct avenues of communication fast enough to accommodate the trade of the west; and that capital thus invested will not only contribute largely to the increase in the value of property, along its line, as well as in this city, but also pay a good interest to the holder of the stock.

A glance at the statistics of exports from the west and northwest, during the last three years, to the Atlantic cities, by way of the lakes, and *via* New Orleans—will convince the most skeptical of the soundness of this general position. The immense quantities of pork, flour, corn, wheat, etc., conveyed annually to Baltimore, Philadelphia, New York and Boston, from the western States (down the Mississippi river) for home consumption, and for foreign shipment, is almost incredible. The large amount of breadstuffs, which reach tide-water, from the country bordering upon the lakes—down the Hudson and over the *Western* railroad, is another feature for consideration.

Our readers are aware of the fact, no doubt, that during the past season, it has been utterly out of the power, and beyond the capacities of the *Western* road, with all its immense amount of machinery, and merchandize accommodations, to transport produce as rapidly as was desired by shippers; and repeatedly, during the last three or four months, the

storehouses along the line have been crammed to their utmost capacities, with produce which, for the time being, it was impossible to forward, in consequence of the press of business. This was not originally calculated upon, nor is it now believed, by those who are determined to be skeptical, that *this trade must continue*—and that, instead of diminishing, it will increase in years to come! As sure as we now live to witness this extraordinary prosperity in our internal affairs, so sure will this traffic advance, and in an increased ratio, too! Such, then, being the fair presumption, why talk of the probability that two channels through the great "*Keystone*" State, for the accommodation and partial transport of this produce, cannot exist! The feeling is altogether too narrow—and is unworthy of our consideration, in these days of national improvements, and national prosperity!

We have said it is our purpose and wish to lend our humble aid in favor of both these great projects, and it is the design of the Railroad Journal to support, always, the plans of all sections of the country in internal improvements. We have no disposition to prefer one for another, or to bring one into disparagement at another's expense. We, therefore, repeat, that while we earnestly hope to see the energies of capitalists and business men put forward to urge on the progress of the *Central* road to completion, we shall be most happy to see the prospects of the *Northern* route brighten. The road as proposed along the *West Branch*, passes through a most fertile and beautiful country, rich in agricultural and mineral wealth. A part of its course will lie through a section of the State which is thickly populated, and it will be sufficiently distant from the line of the *Central* road, to ensure it a good business, at all seasons of the year.

Its terminus, at the Lake, will be its most important feature, and its transportation business could not be otherwise than productive of immense profit. The local business and the local travel, too, upon this route, must necessarily be very great—while the produce of the Lake country, and the northwest, would find its way (in a very considerable proportion) to the east—through such a channel. That a road, "by way of the *West Branch*," would prove a highly profitable undertaking, and that it must be a successful one, in all respects—none will question. But that it will materially interfere with the *Central*, or that with the other—we cannot believe. To the friends of the *Northern* route, then, we say most cordially—*go on with your work*—and let us have such a road as the wealth and abilities of the city and country can give us. There is room for both—there will be ample business for both—their interests need in no wise conflict—there is need of both—and now is the time to press the enterprise forward. With two such routes as these through the State, no fears need be entertained for the result—nor can any rival route be brought to bear, injuriously, upon the interests of these. Competition increases business. Increased facilities tend inevitably to enhance commercial traffic—and we could readily point to scores of instances, both in this country and in Europe, to sustain this proposition.

Let us have the "*Central*" road, then—and, by all means, let us have the "*Northern*." Let the friends of each look to the interests of each—and, adopting the broad principle that there is "room enough in this world for us all"—let them strain every energy to consummate both plans, and thus place the State of Pennsylvania in front of all competitors as regards her great internal improvements.

Baltimore and Ohio Railroad.

(Continued from page 216.)

Dr. STATEMENT A.	
Stock in the Washington branch road	\$1,032,600 00
Cost of road to Harper's Ferry, including real estate and depots, locomotives, passenger and burden cars, etc.	4,000,000 00
Cost of road west of Harper's Ferry	3,623,606 28
Coal trade, for amount due on that account	101,494 78
Sterling bonds in the hands of Messrs. Baring, Brothers & Co., of London	3,181,005 11
City of Baltimore six per cent. stock on hand	20,096 59
Sinking fund, for the redemption of the million loan	55,900 00
Invalid fund, for amount due by that account	196 28
New York and Maryland Iron and Coal company, due by them	13,027 59
Stock in the Pittsburgh and Connellsville railroad co. for instalment paid	1,750 00
Cash in the hands of officers	15,094 63
Cash on hand	58,868 71

## Cincinnati, Dayton and Hamilton Railroad.

At a late meeting of the board of Directors of the Cincinnati, Hamilton and Dayton railroad company the survey and final location of the road from this city to Hamilton, was submitted preparatory to putting the line under contract. The company intend, if possible, to have the grading completed this year, so as to have the road ready for the superstructure early next season. This is an important improvement, and must be greatly beneficial to Cincinnati, says the Gazette. Meetings have been held at Richmond and elsewhere, to take steps to extend the line from Hamilton, on towards Indianapolis, to form a link in the proposed road from Cincinnati to St. Louis. Those feeling an interest in this enterprize, who have not yet taken any of the stock, would do well to subscribe without further delay.

## ITEMS.

**A New Destructive.**—We understand from a gentleman who has recently returned from Washington, that the government has just concluded a negotiation for the purchase of a most formidable weapon of destruction, in the shape of a rocket, which can be impelled by one man, and yet will destroy life and property at a distance of two miles. This weapon was invented by an Englishman and offered to the government, but not adopted by them, when an American saw its destructive properties, and purchased the patent right for £1000. He then returned to the United States, and offered it to the war department, and after it had been subjected to experiments in presence of all the distinguished military and naval officers, it was approved of and purchased for \$20,000. A company of artillerists are to be drilled expressly to the use of this weapon and despatched to the seat of war forthwith.

**Canal Trade.**—Ninety boats laden with the produce of Pennsylvania entered the Tide Water canal for Havre de Grace during the first week of navigation.

**Ship Building on the Ohio.**—A letter from Marietta describes the launch of another full rigged barque at that place. She is about 300 tons burthen; length on deck 104 feet, depth of hold 12 feet, breadth of beam 24 ft. 3 in., draws 6 feet 6 inches forward, and 7 ft. 10 inches aft; her cabin containing 10 state rooms handsomely furnished. She is loading with corn at Portsmouth, Ohio, and will sail in a few days for Cork, Ireland. The Cincinnati Enquirer says that the two schooners recently built on the Ohio, the Grace Darling and Ohio, left that place last week, for Salem, Mass., freighted with western notions, viz: 508 barrels of pork, 503 barrels of beef, 1513 kegs and 200 barrels lard, 91 barrels flour, 60 bags and 26 barrels dried apples, 6 barrels peaches, 110 tons black walnut timber, 8543 staves, 16 dozen axe handles, 2000 locust trenails, 34 half-barrels beef, 75 kegs butter, 6 bags hickory nuts, 150 handspikes, 167 dozen belaying pins, 15 sacks feathers, 50 sacks corn, 12 boxes madder, and to top off with, 70 barrels whiskey. They will probably be about one month making the trip.

**Lake Superior.**—This immense inland ocean is 490 miles in length, and 1700 miles in circumference: being the largest body of fresh water on the globe. It contains many islands, one of them Isle Royale, is 100 miles in length, and 40 miles broad. Upwards of 30 rivers empty themselves into it, and one curious fact in relation to it is well ascertained, that the quantity of water discharged by the Sault Ste Marie, is not one-tenth what it receives from its tributary streams. Evaporation must, therefore, be the principal agent in keeping the lake down to its usual level. A survey for a canal at the Sault Ste Marie, on the British side, has been made by the Montreal Mining company. The distance is stated to be half a mile, and the fall 18 feet; the excavation mostly in sandstone. There is scarcely a doubt that this work will be speedily accomplished, for it will complete the chain of ship canals through Canada from tide water into the waters of lake Superior; and the projectors are in hopes that this canal when finished will enable them to command the increasing business on both sides of this great inland sea.

**Railway Dividends in France.**—The dividend of the Paris and Rouen railway company, fixed by the recent general meeting at 25 $\frac{1}{2}$  fr. per share, is advertised to be paid on and after the 10th inst. The interest of 4 per cent, or 20 fr. per share, in the Rouen and Havre railway, is also advertised to be paid on and after the 11th inst. There are at present opened in this country, 1435 kilometres of railway; and 529 kilometres additional may be brought into circulation in the course of the present year. The first railways ever made in France were in connection with coal mines; and the railways, either exclusively or principally devoted to the conveyance of coal, are even now of no inconsiderable length. They are as follows:—the railway from St. Etienne to the Loire, 21 kils., from St. Etienne to Lyons, 60 kils.; from Montbrison to Montbrison, 16 kils.; from Epinac

to the Canal de Bourgogne, 28 kils.; from Denain to Abbecon, 14 kils.; the railway du Gard, and de la Grand Combe, 86 kils.

**Arnoux Railway.**—A recent number of the Mining Journal contained a favorable notice of the little railway from Paris to Sceaux, constructed on M. Arnoux's principle of extraordinary sharp curves. The tiny line is certainly a curiosity in railways. It twists and twines about like a serpent; and at one of the stations the curve is so sharp, that the people on the locomotive might almost shake hands with those in the last carriage. It ascends, too, by means of these twistings and turnings, a very steep hill—a feat perfectly impossible to an ordinary railway; but M. Arnoux's system has two immense drawbacks, which will alone suffice to prevent it from coming into general use.—The first is, that the rate of travelling upon his railway is extraordinarily slow—scarcely quicker than an ordinary stage coach. It takes positively about 25 minutes to go from Paris to Sceaux, although the distance is not greater than 6 English miles. Such a rate of speed will certainly not satisfy the travelling public in this go-a-head age. The next objection is, that not more than six or eight carriages can be employed in a train. If there were more than eight, the last carriages in the train would be in danger of being thrown over at the curves, from the simple fact, that they would be running in one direction, whilst the locomotive would be pulling in another. This objection was pointed out by scientific men before the opening of the line; but M. Arnoux denied its force, alleging that the principle upon which his wheels are constructed, and which makes part of his plan, obviated it. But he has since been compelled virtually to admit its truth, by never allowing more than a train of eight carriages (the locomotive has no tender) to travel on the line. Notwithstanding these objections, however, there is no doubt that M. Arnoux's system might be adopted with great advantage in mountainous or even hilly countries.

## RIDING PRIVILEGE ON RAILROADS.

A correspondent, in yesterday's American, has called public attention to the resolutions which lately passed the first branch of the city council, to confine the privilege of gratuitous riding in the railroad cars to the directors alone, and the amendment adopted in the second branch, extending it to the families of directors—and we are glad to see that the American's correspondent recommends the resolution without the proposed amendment, as we think the privilege, if confined to the director alone, would afford him a handsome compensation for his services, if he lives on the line of the road. We will speak particularly of the Baltimore and Susquehanna railroad, with which we are familiar. The charge of travel along the line from Baltimore to York, varies from 12 $\frac{1}{2}$  cts. to \$1 50, according to distance. A director living six or seven miles from town, and going and coming daily, will save \$124 80 per annum, supposing him to travel 312 days in the year—farther from the city he would

save from fifty cents to one dollar per day, or from \$156 to \$312 per year. If half this sum be added for the passage of members of his family, it will be seen that his becoming a director is of some importance to his interests. We think it perfectly correct that the director shall travel free of cost himself, so long as he is paid nothing for his services; but we have uniformly been of opinion that the privilege should not be extended farther, because it is liable to be greatly abused. We do not believe that any of the directors on this road sought their appointments with views to the benefits of gratuitous riding, because but one of them resides on the road, and he seldom visits the city excepting in the discharge of his duty as a director.

While on the subject of railroad management, we will again suggest the propriety of adopting the system in operation elsewhere, of selling tickets for the season, or in quantities, at a reduced price, to way passengers. Experience has demonstrated that it increases the number of passengers, and adds to the revenue of the company. We hope that the directors of the several railroads will take this subject into consideration, as we are convinced that proper investigation will show them the propriety of adopting the course we have suggested.—*Balt. Clipper.*

### BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

### MISSING NUMBERS

#### OF THE RAILROAD JOURNAL.

Subscribers, who wish to obtain Missing Numbers of Back Volumes of this Journal, will do well to apply immediately.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

**RAILROAD IRON.—THE NEW JERSEY** Iron Company, Bonton, N. J., are now preparing to make Railroad Bars, and are ready to take orders or make contracts for Rails, deliverable after the first of December next. Apply to  
**FULLER & BROWN, Agent,**  
No. 139 Greenwich, corner of Cedar street.  
September 18, 1846. 10639 41f

**LAWRENCE'S ROSENDALE HYDRAULIC** Cement. This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors, and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper-barrels, by  
**JOHN W. LAWRENCE,**  
142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 32 17

**ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—** for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

**ALFRED L. KEMP,** 75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846. **W. H. CALKINS, and Others.**

To all whom it may concern.—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 30 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed.] **WILLIAM ROE, Supt. of Power.**  
I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845. [Signed.] **G. A. NICOLL,**  
Supt. Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern.—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed.] **T. L. SMITH,**  
Jersey City, November 4, 1845. N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car. For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot, } [Signed.] **JOHN LEACH,**  
Jamaica November 12, 1846. } 1y19 Supt. Motive Power.

# **RICH & CO'S IMPROVED PATENT SALAMANDER SAFES.**

Warranted free from dampness, as well as fire and thief proof.

Particular attention is invited to the following certificates, which speak for themselves:

TEST No. 10.

*Certificate from Mr. Silas C. Field, of Vicksburg, Mississippi.*

On the morning of the 14th ult., the store owned and occupied by me in this city, was, with its contents, entirely consumed by fire. My stock of goods consisted of oil, rosin, lard, pork, sugar, molasses, liquors, and other articles of a combustible nature, in the midst of which was one of Rich's Improved Patent Salamander Safes, which I purchased last October of Mr. Isaac Bridge, New Orleans, and which contained my books and papers. This safe was not hot, and did not cool sufficiently to be opened until 16 hours after it was taken from the ruins. At the expiration of that time it was unlocked, when its contents proved to be entirely uninjured, and not even discolored. I deem this test sufficient to show that the high reputation enjoyed by Rich's Safes is well merited. S. C. FIELD.

TEST No. 11.—*Certificate.*

By the fire which occurred in this village on the 27th July last, our Law Office, together with many other buildings, was destroyed—we had in our office one of Rich's Improved Patent Salamander Safes, which, though heated red hot, preserved, without being the least damaged, many papers valuable to our clients—the envelopes of a few papers being slightly scorched. Some twenty-four hours after the fire, the safe was removed, and so hot was it that several hours were required for it to cool off. Our office was in the second story of a large brick building, all the wood used in construction of said house being pitch pine. While the safe was red hot, one of the walls tumbled in, and so injured the lock that it was necessary to break the door open. From this test, we feel no hesitancy in recommending "Rich's Patent Salamander Safe" as entirely fire proof.

GOREE & KING.

Marion, Ala., Sept. 15th, 1846.

*Still other Tests in the Great Fire of July 19, 1845.*

The undersigned purchased of A. S. Martin, No. 138½ Water street, one of Rich's Improved Patent Salamander Safes, which was in our store, No. 54 Exchange place. The store was entirely consumed in the great conflagration on the morning of the 19th inst. The safe was taken from the ruins 52 hours after, and on opening it, the books and papers were found entirely uninjured by fire, and only slightly wet—the leather on some of the books was parched by the extreme heat. RICHARDS & CRONKHITE.

Benton, Miss., December 27, 1845.

One of Rich's Improved Salamander Safes, which I purchased on the 21st of June last of A. S. Marvin, 138½ Water street, agent for the manufacturer, was exposed to the most intense heat during the late dreadful conflagration. The store which I occupied, No. 46 Broad street, was entirely consumed; the safe fell from the 2d story, about 15 feet, into the cellar, and remained there 14 hours, and when found, I am told, and from its appearance afterwards, should judge that it had been heated to a red heat. On opening it, the books and papers were found not to have been touched by fire. I deem this ordeal sufficient to confirm fully the reputation that Rich's safe has already obtained for preserving its contents against all hazards. (Signed.)

WM. BLOODGOOD.

New York, 21st July, 1845.

Reference made to upwards of nine hundred and fifty merchants, cashiers, brokers, and officers of courts and counties, who have Rich's Safe's in use.

The above safes are finished in the neatest manner, and can be made to order at short notice, of any size and pattern, and fitted to contain plate, jewelry, etc. Prices from \$50 to \$500 each. For sale by

A. S. MARVIN, General Agent,  
138½ Water st., N. Y.

Also by Isaac Bridge 76 Magazine street, New Orleans.

Also by Lewis M. Hatch, 120 Meeting street Charleston, S. C.

## **FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

TO THOSE INTERESTED IN Railroads, Railroad Directors and Managers are respectfully invited to examine an improved SPARK ARRESTER, recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger and freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Supt Hartford and New Haven Railroad; W. R. M'Kee, Supt Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Supt New Jersey Railroad Trans. Co.; J. Eliou, Supt Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Supt Elizabethtown and Samerville Railroad, R. R. Caylor, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Supt Macon Railroad, Macon, Ga.; J. H. Cleveland, Supt Southern Railroad, Monroe, Mich.; M. F. Chittenden, Supt M. P. Central Railroad, Detroit, Mich.; G. B. Fink, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckly & Drury, Boston, will be promptly executed. FRENCH & BAIRD.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms. Philadelphia, Pa., April 6, 1844.

•• The letters in the figures refer to the article given in the Journal of June, 1844. ja45

**PATENT HAMMERED RAILROAD, SHIP and Boat Spikes.** The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed. JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y. The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merritt, New York; J. H. Whitney, do.; E. J. Etting, Philadelphia; Wm. E. Coffin & Co., Boston. ja45

**MACHINE WORKS OF ROGERS, Ketchum & Grosvenor, Paterson, N. J.** The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch. Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR, Paterson, N. J., or 60 Wall street, N. York. ly

**PATENT RAILROAD, SHIP AND BOAT Spikes.** The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by J. & J. Townsend, Albany, and the principal iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

•• Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand. ja45

## **SPRING STEEL FOR LOCOMOTIVES,**

Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1½ to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works;

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

### THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.	
4,224 Timbers, 11 ft. long, 3 x 6 inches =	68,696 ft. b.m., at \$10 = .....\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	4,403 ft. b.m., at \$13 = ..... 57 94
13,000 Spikes = 2,250 lbs. at 4½ cts. ....	101 25
Workmanship free of patent charge.....	600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.

Civil Engineer and Patentee.

No. 277 South Third St., Philadelphia. 331f

### FRANKLIN HOUSE,

No. 105 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor, D. K. MINOR.

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,  
105 Chestnut Street,  
PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS.—Five Dollars a year, in advance.

Leave Boston at 7½, 11½ A.M., 2½, 5½, 7 P.M.

Leave Medford at 6½, 8 A.M., 1½, 4½, 6 P.M.

The Depot in Boston is on Haymarket Square.

Passengers are not allowed to carry Baggage above \$50 in value, and that personal, unless notice is given, and an extra amount paid, at the rate of the price of a Ticket for every \$500 additional value.

1y31 CHAS. MINOT, Super't.

## SUMMER ARRANGEMENT.—NEW YORK AND ERIE RAILROAD LINE, from April

1st until further notice, will run daily (Sundays excepted) between the city of New York and Middletown, Goshen, and intermediate places, as follows:

### FOR PASSENGERS—

Leave New York at 7 A. M. and 4 P. M.

" Middletown at 6½ A. M. and 5½ P. M.

FARE REDUCED TO \$1 25 to Middletown—way in proportion. Breakfast, supper and berths can be had on the steamboat.

### FOR FREIGHT—

Leave New York at 5 P. M.

" Middletown at 12 M.

The names of the consignee and of the station where to be left, must be distinctly marked upon each article shipped. Freight not received after 5 P. M. in New York.

Apply to J. F. Clarkson, agent, at office corner of Duane and West sts. H. C. SEYMOUR, Sup't. March 25th, 1846.

Stages run daily from Middletown, on the arrival of the afternoon train, to Milford, Carbondale, Honesdale, Montrose, Towanda, Owego, and West; also to Monticello, Windsor, Binghamton, Ithaca, etc., etc. Agent on board. 13 of

## NORWICH AND WORCESTER RAILROAD.

Summer Arrangement, commencing

Monday, April 6, 1846.

### Accommodation Trains, daily,

except Sunday. Leave Norwich, at 6 a.m., and 4½ p.m. Leave Worcester, at 10 a.m., and 4½ p.m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston, and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 1½ p.m. train from Boston.

New York Train via Long Island Railroad:

Leave Allyn's Point for Boston, about 1 p.m., daily, except Sunday.

Leave Worcester for New York, about 10 a.m., stopping at Webster, Danielsonville, and Norwich.

New York Train via Steamboat—Leave Norwich for Boston, every morning, except Monday, on the arrival of the steamboat from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 4½ p.m., daily, except Sunday, stopping at Webster, Danielsonville and Norwich.

Freight Trains daily each way, except Sunday.—Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are Less when paid for Tickets than when paid in the Cars.

31 ly J. W. STOWELL, Sup't.

**TROY RAILROADS.—IMPORTANT NOTICES.**—Troy and Greenbush Railroad, forming a continuous track from Boston

to Buffalo and Saratoga Springs. This road is new, and laid with the heaviest iron H rail. Trains will always be run on this road connecting at Greenbush each way with the trains to and from Boston and intermediate places, leaving Greenbush daily at 1 1/2 p.m. and 6 p.m., or on arrival of the trains from Boston; leave Troy at 7 1/2 a.m. and 4 1/2 p.m., or to connect with trains to Boston.

Trains also run hourly on this road between Troy and Albany. Running time between Greenbush and Troy, 15 minutes.

#### TROY AND SCHENECTADY RAILROAD.

This road is laid its entire length with the heaviest H rail— which is not the fact with the road from Albany. Trains will always be run on this road connecting each way, to and from Buffalo and intermediate places. Leave Troy for Buffalo at 7 1/2 a.m. and 1 p.m. and 6 1/2 p.m., or to connect with the trains for the west; leave Schenectady at 2 1/2 a.m., 8 1/2 a.m., 1 p.m. and 3 1/2 p.m., or on arrival of the trains from Buffalo and intermediate places.

#### TROY AND SARATOGA RAILROAD.

##### THE ONLY DIRECT ROUTE.

No change of passenger, baggage or other cars on this route. Cars leave Troy for Ballston, Saratoga Springs, Lake George and White Hall at 7 1/2 a.m., (arriving one hour in advance of the train from Albany,) and at 3 1/2 p.m. Returning, leave Saratoga at 9 a.m. and 3 1/2 p.m., (reaching Troy in time for the evening boats to New York.) Cars also leave Troy for the Burroughs at 3 1/2 p.m. and 7 p.m., connecting with packet boats for the north. This takes passengers from New York and Boston to Montreal in 44 hours.

N.B. Travellers will find the routes through Troy most convenient and economical, and as expeditious as any other. The steamboats to and from New York land within a few steps of the railroad office, and passengers are taken up and landed by the different railroad lines at the doors of principal hotels, thus saving all necessity for, and annoyance from, hack drivers, cabmen, runners, etc.

Aug. 3, 1846.

1y 33

**BALTIMORE AND OHIO RAILROAD.** MAIN STEM. The Train carrying the Great Western Mail leaves Bal-

timore every morning at 7 1/2 and Cumberland at 8 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburgh and Hancock, connecting daily each way with the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry— with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Pittsburgh. Time of arrival at both Cumberland and Baltimore 5 1/2 P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pittsburgh \$10, and time about 32 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$12. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

#### WASHINGTON BRANCH.

Daily trains at 9 A. M. and 5 P. M. and 12 at night from Baltimore and at 6 A. M. and 5 1/2 P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. al3y/

**MANUFACTURE OF PATENT WIRE** Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by JOHN A. ROEBLING, Civil Engineer, Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition. 2v19 1y

**T**O RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.

**PASCAL IRON WORKS**

**WELDED WROUGHT IRON TUBES**

From 4 inches to 4 in calibre and 8 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T, L, and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by **NORRIS, TASKER & MORRIS.** Warehouse S. E. Corner of Third & Walnut Streets, PHILADELPHIA.

**T**O LOCOMOTIVE AND MARINE ENGINE BOILER BUILDERS. Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufacture: and for sale by

**MORRIS TASKER & MORRIS,** Warehouse S. E. corner 3d and Walnut Sts., Philadelphia.

**P**ATENT INDESTRUCTIBLE WATER Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York.

**J. BALL & CO.**

REPORT OF THE ENGINEER OF THE NASHVILLE  
AND CHATTANOOGA RAILROAD.

AUGUSTA, (GA.) February 14, 1847.

*To the Commissioners of the Nashville and  
Chattanooga Railroad:*

GENTLEMEN: I have the pleasure to communicate to you the results obtained from a survey, made at your request, during the past summer and autumn, with a view to ascertain the practicability and probable cost of constructing a railroad between Chattanooga and Nashville.

The survey was commenced at Chattanooga, the Northwestern Depot of the Georgia improvements, which, after turning the southern extremity of the Alleghenies, here terminate upon the banks of the Tennessee—690 feet above, and 430 miles from the Atlantic, and at the base of the second series of mountain ranges, that separate the Atlantic from the Western States. A direct line from this point to Nashville would cross these mountains nearly at right-angles; and pass a short distance north of Murfresboro. Upon such a route, or any line approximating very near to it, there would be almost insurmountable difficulties to overcome. It will be seen, however, from the following brief description of the topography of the several mountain ranges composing this series, that a route may be obtained through them, which though circuitous, is not only entirely practicable, but upon which a road can be constructed, at a cost which, from the character of the obstacles encountered, will be considered quite low.

The Lookout mountain, which is the first encountered, is but an out-lier of the main chain, commencing abruptly at the Tennessee river, and rising much above the others, stretches in an unbroken line to the Coosa in Alabama—forming an impassible barrier to the construction of a railroad upon any route between the banks of these streams.

The second is a spur of the Cumberland, from which it is separated by the Sequatchee river. The Tennessee, instead of following what would seem to be its natural channel to the Gulf, through Lookout and Wills' vallies, severs this spur, leaving that portion known as Waldin's ridge on the north, and Raccoon mountain on the south, opening a passage along its banks for a railroad between them. Thence it follows a course parallel to its previous general direction to Gunter's landing, where it turns the southern extremity of the main Cumberland, and enters the Ohio near its mouth. In addition to the gorge through which the Tennessee forces its circuitous channel, the Raccoon mountain is cut by a deep defile leading from Lookout into Running Water valley, along which the Old Federal road, from Augusta to Nashville, formerly passed. The summit of this pass is but 338 feet above Chattanooga, and will afford a practicable line over it.

The main Cumberland is the last of the series, and offers the greatest obstacle to a direct route. Within the range of our examinations its summit is covered by extensive table lands, averaging about 2000 feet above

the ocean; this uniform elevation is preserved until we reach the head waters of Crow creek, where a depression occurs of about 700 feet, known in the vicinity as Montgomery's Gap, eight miles east of Winchester. The elevation of this Gap is 1365 feet above the Atlantic, and but 200 yards wide on top, with steep declivities on each side admitting the passage of a railroad by means of a short tunnel, 209 feet below its apex.

From this general view of the features of the mountain ranges it will be perceived that the route of the railroad must either cross the Tennessee at Chattanooga, avoiding the Lookout altogether, and follow its right bank to Crow creek, passing near Hornbacker's mill and crossing the Sequatchee on the Rutledge lands—or, keep the east side of the river, and passing under the cliffs of Lookout mountain enter Lookout valley, and thence up this to the defile leading into Running water valley, and along this to the Tennessee near Gardenhier's ferry. Thence along the river banks to Nichajack Cave, where we enter Hog-jawbone valley, and pursue it near the base of the Raccoon mountain until we again strike the river at the foot of Long Island. The road may either cross the river at this point, or follow its left bank farther down, and thence pass over to the valley of Crow creek. This route is about 16 miles shorter than that by the river, but encounters gradients at the Lookout mountain of 63 feet per mile: which, however, may be reduced to 45 feet, by a bolder and more expensive line, thrown upon the escarpments of the mountain.

As the route by Running Water was examined more carefully than by the river, I have founded the estimate of the cost of the road upon it, though the latter, notwithstanding its increased length, will, it is thought, prove the least expensive.

After entering Crow creek valley, the route will pass over an even surface, with favorable gradients, until it reaches Mr. Walker's, where the ascent of the mountain is commenced and overcome by a continuous inclination of 1.9 per 100 feet for 4½ miles, to the entrance of the tunnel. At this point the road will attain the elevation of 1156 feet above the ocean, and pass through the mountain by a tunnel 2100 feet in length, and thence descend by a similar or easier gradient, of about two miles in length, to the Boiling Fork of Elk river.

A tunnel of 2100 yards in length, would pass through the mountain nearly upon a level with its western base, an ascent of only 325 feet from the foot of the eastern slope, which could be overcome by the general maximum gradient used upon the remainder of the route.

The construction of a railroad across the mountain at this point, is much less difficult than upon any of the routes proposed to connect the Atlantic with the Mississippi valley, and also overcomes a much less elevation. The height of the shortest tunnel above the ocean being but 1156 feet, while the Central railroad of Pennsylvania, on its most favorable route, will encounter an elevation of 2183 feet, and the Baltimore and Ohio road 2370

feet at the tunnel, which is 400 feet below the apex of the mountain.

The descent from Montgomery's Gap brings us upon a comparatively level region, which skirts the whole western slope of the mountain, and is about 350 feet above its eastern base. This elevated plateau is in fact a branch of the main mountain, extending in width in the direction of Nashville, to the ridge dividing Elk and Duck rivers, where the face of the country suddenly drops off, between 200 and 300 feet, and thence gradually descends towards the Cumberland; its general character being a plane, crossed by several high and broken ridges, interspersed with a number of mounds or knobs, offering no material obstruction to the easy graduation of the road.

The route examined through this region, after leaving the mountain, passes 2½ miles above Winchester, and crosses Elk river between Spring and Taylor's creeks, and thence follows the ridge, dividing these streams, to the head of the latter, whence it passes across some of the flat branches of Rock creek, and intersects Elk ridge at Montgomery's. Thence the descent from this step of the mountain is effected, at the general maximum gradient, along the valley of Norman's creek without encountering much expensive work, reaching the plane below at the Barren Fork of Duck river. The line of survey follows this stream to the Three Forks, thence up the Garrison to War Trace, and along the latter to Bell Buckle, at the head of which it passes the high ridge parting the Stone and Duck river waters, at a point where it is entirely severed, admitting a very easy ascent to the summit.

From Bell Buckle summit, the descent to the Stone river waters, is at 42 feet per mile, over an even surface, passing in the vicinity of Fosterville, and south of Lee's knob. Thence the country offers no further difficulty until we reach the ridge dividing Stewart's and Hurricane creeks, where there may be some expensive work. The line traced crosses this ridge at Captain Oliphant's and then passes over even ground to the ridge between Hurricane and Mill creeks, which it crosses at the head of Collins' creek, and thence follows the favorable slopes of the latter to Antioch meeting house. Whence the general course of Mill creek is pursued to Whitest church, where it leaves it, and passing in the vicinity of Mr. Raines', crosses Brown's creek and enters Nashville.

Between the Tennessee river and Nashville, the line surveyed is quite straight. The face of the country, after passing the mountains, will admit of a number of other practicable routes, some of which have been examined instrumentally. The line already described was traced, after a full reconnaissance of the country, and without reference to any local considerations, being governed by the character of the ground, and its advantages with reference to the trade and travel passing between its termini. I was not sufficiently conversant with the products and population of the region which may be made tributary to the road, to enable me to deter-

mine how far its general directness could be sacrificed to the local trade, with a view to its greatest profitableness to the stockholders, and consequent usefulness to the community. Upon a full examination of this subject, in all its bearings, it is probable that many deviations from the line surveyed will be found advisable.

A route leaving the Tennessee valley by Battle creek, or little Sequatchee river, would save from 10 to 15 miles of distance, but would have to overcome an additional ascent of between 800 and 900 feet, which is equivalent to about 34 miles of increased length of road, making the longer line in the cost of transit over it, much the least expensive, and practically, some 20 miles the shortest.

The following condensed statement will exhibit the cost of the road, upon the preferred route. I have not thought it necessary to trouble you with the details of the estimate:

ESTIMATE.	
Graduation, bridging and tunneling.....	\$1,440,000
11,750 tons of railroad iron.....	940,000
Iron chairs, spikes and bolts.....	76,000
Cross ties, ground sills, etc.....	92,000
Laying superstructure.....	78,000
Engineering and contingencies.....	184,000

\$2,810,000

Of the above amount you will perceive, that there is not much over one-half due to the physical difficulties of the country. The remainder is chiefly the cost of the superstructure, which is mainly dependent upon the quantity, and price of iron, its chief constituent. The estimate is predicated upon an  $\pi$  rail weighing 75 tons per mile, laid upon cross-ties 24 feet apart from centre to centre, supported throughout by heavy ground sills.—This plan will give a superstructure amply sufficient to sustain the traffic that may reasonably be expected upon the road. In addition to the cost of the road, there will be required for the purchase of locomotives, and construction of cars, shops, warehouses, water stations, and overseer's dwellings, the further sum of \$320,000.

The whole length of the road will be 152 miles, the general maximum gradient 42 feet per mile; or a rise of 8.10 in 100. This gradient is exceeded, at the Cumberland and Raccoon mountains only; at both of which, as I have before observed, a resort to a steeper inclination may be avoided. The first, by a tunnel of 2100 yards long, and the other following an almost level route, along the bank of the river. The longer tunnel would add fully \$300,000 to the cost of preparing the road bed, while the annual cost of supplying the necessary auxiliary locomotive power for the higher gradient, (upon the line estimated,) would not exceed \$5000, and this engine could be employed during the intervals of passing the trains, in carrying the coal cars to the central depot opposite Winchester.

The increase in the length of the route by Montgomery's Gap, over a straight line between Nashville and Chattanooga is about 38 miles, which is by no means a larger increase than is usual in passing a mountain region. On the proposed Central railroad of Pennsylvania, from Harrisburg to Pittsburg, the increase on the most direct route of the

several surveyed, is 77 miles, or an addition of 48 per cent.; while on that portion of the Baltimore and Ohio railroad, now in use, east of the mountains, the increase is over 66 per cent. Whether this ratio is increased or diminished between Cumberland and the Ohio, I am not able to state.

The southerly detour in the line, which is necessary to pass the mountain, at its low depression, is not without its counterbalancing advantages. In addition to the greater extent of mineral and fertile region, thereby accommodated, the route, is thrown within a distance of Huntsville, which will render a communication with that important section of country, by a branch intersecting it near Winchester, not only more feasible as an outlet to the Atlantic than any other; but it will at the same time give them a connection with New Orleans, through Nashville, inferior to none that has been suggested.

If it should become necessary—from a failure to raise the means to complete the whole enterprise at once—to stop at any intermediate point, a good communication could be maintained with the Georgia improvements, by steamboats on the Tennessee, if the road should be carried no further than from Nashville to its banks. The cost of this portion of the line—116 miles in length—may be stated at \$1,950,000. The navigation of the Tennessee between this and Chattanooga, can be accomplished with light steamboats at all seasons, and during the winter and spring, by boats of large burthen. The only obstructions of importance, are encountered in passing between Walden's Ride and Raccoon mountain; where the contracted channel of the stream, at the "Suck" and "Pot"—the first during low water and the latter at higher stages, renders the ascent in consequence of the rapidity of the current difficult. The depth of water at all seasons, at these points, is ample, and the impediments to the navigation involve simply the question of time, the process at present adopted to draw the boat through the current, is tedious, and could, if the trade should increase sufficient to justify it, be superseded by the use of mechanical means, that would render certain, and greatly reduce the time now consumed in passing them.

This partial execution of the projects should be adopted as a temporary expedient only: the completion of the whole enterprise to be carried forward as early thereafter as practicable. In any event it would be the most judicious policy to pursue this plan, as the majority of the line could at once be brought into profitable use.

It is not the province of the engineer, to submit estimates of the probable profits of a railroad, unless founded upon specific data, in relation to the transportation and travel, that may be expected upon it; though it has frequently been their practice, to indulge in such calculations. I am not, however, in possession of statistical information, that will enable me to do justice to the subject, and I shall therefore prefer, simply referring to the fact, that there is no instance in the United States, where a railroad, that has been "judiciously

located, and economically constructed," that has not on completion proven a good investment of capital. The Georgia railroad—with which I am more familiar than any other—traverses a country compared with that over which your road will for the most part pass, would seem but a barren waste, has never yielded less than six per cent. net profits, and this has been accomplished, with its connections incomplete, encountering strong competition from rival works, and burthened with over 40 miles of unproductive branches. If results like these have been obtained under such circumstance, by a road through a country sparsely peopled, and possessing no coal or other mineral to swell its business, relying mainly for support, upon its local trade and travel; what may you not reasonably expect, from the completion of your road, whose western terminus is the depot of an agricultural region, unrivalled for the extent of its contiguous fertile lands, and the abundance and variety of their products, and which for the most of its length, traverses this rich and populous region, and for the remainder of the distance, a mineral district abounding in iron ore and coal, the latter of which, of itself, affords ample business for many of the northern railroads.

But any calculations of revenue founded upon the present statistics of the country, will present but a partial exhibit of the business that will follow the execution of your enterprise, as railroads have, to a very considerable extent, the property of creating their own transportation. Products of the soil, mines and quarries, which, in consequence of the cost of their transportation to a market, are now enumerated in the schedule of the wealth of the State, will then be brought into use to an extent of which we can at present realize but a faint conception. In no section of the Union has nature distributed with a more bountiful hand the various elements of manufacturing prosperity, than upon the line of this road, and no where will their development add more largely to the population and wealth of the adjacent country, and consequently to the travel and transportation upon a road through it.

The rapid development of the hidden wealth of a mineral region, through the influence of internal improvements, will be better appreciated from the consideration of the fact, that the products of the coal fields of Pennsylvania, but 25 years since, were less than those of Tennessee at the present time. Now, they yield annually upwards of 2,500,000 tons, worth, delivered at the sea board, \$10,000,000. As large as this sum appears, it is still small compared with the product of manufacturing industry, called into activity by the use of coal, and to the success of which it is now an indispensable element. The extraordinary increase in the value of the mineral region of Pennsylvania, is not more striking than was the effect of the completion of the Erie canal, upon the agricultural prosperity of Western New York, or the Western railroad upon the increase of the population and wealth of Boston. These are not isolated cases—similar prosperity has every where

attended those countries traversed by these improvements, and in proportion to the productiveness of the soil, and the abundance of its mineral resources are their benefits felt.

That there will be a connection between the south Atlantic coast and the great West at an early period, no one acquainted with the extent and importance of the interests to be beneficially affected by it can for a moment doubt—and that the route of your road is the most advantageous for such a communication is equally clear. Through the Cumberland it brings the mouth of the Ohio—the heart of the west—more than 700 miles nearer to the Atlantic, than by any of the present avenues of commerce, an advantage which must claim for the line, a large share of the travel and transportation of the products and consumption of the Mississippi valley. It would seem unnecessary, however, to go beyond the country which now makes Nashville its market, to find ample business to justify the construction of this railroad—opening as it does to Middle Tennessee, a direct route to consumers of her present products, distributing them through Alabama, Georgia, Florida and Carolina, by means of the net work of railroads diverging from Atlanta the Atlantic end of the Georgia State railroad—leaving out of view the foreign market for Indian corn, her great staple, which will find at Charleston and Savanna a cheap and ready transit to Europe.

The improvements in machinery and construction of railroads, have been so great within the last few years, that all other artificial mediums of transportation have nearly ceased to be considered as rivals, and many of the natural channels of trade now offer but a feeble competition for the products that formerly floated upon their currents. In fact, the causes which have heretofore tended to fix, and seemingly render permanent, the location of cities, have in a great measure lost their influence, and hence it has become the part of wisdom, in those interested in sustaining the present depots of commerce, to call to their aid this comparatively new agent—availing themselves of its powers to preserve and increase their prosperity rather than permit it to minister to the rise of other and rival cities.

In conclusion, I will add that the considerations in favor of the construction of this work, are so strong—its "value to the farmer, mechanic and traveller so clear," and its importance to the continued prosperity of your city, so manifest, that I cannot for a moment believe, that there will be lacking the enterprize or the means, necessary to carry it through, when the subject shall be properly brought before the citizens of Tennessee. Its construction need not be a drain upon their resources. A proper application of their time and labor will enable them to complete most of the graduation and superstructure without materially interfering with its ordinary operations; and the iron may be made within the State, upon more favorable terms than it can be procured from any other quarter, leaving but little cost to be expended for foreign labor or materials, and making its construction add to

the activity of the population and the early development of the resources of the State.

I take this occasion to acknowledge the hospitalities extended to myself and assistants by the citizens of Tennessee, upon the line of our survey. It has been my fortune to have been professionally engaged in nearly every section of the Union, but I have nowhere met with so cordial a welcome, or observed such strong feeling manifested in favor of any enterprize as by the people generally, for this.

The immediate direction of the instrumental examinations was committed to Theodore S. Garnett, C. E. of Virginia, who carried forward the survey, with great perseverance and energy, accomplishing a vast deal of work with very limited means.

All of which is respectfully submitted, by  
Your obedient servant,  
JOHN EDGAR THOMSON,  
Civil Engineer.

##### Wheel Tires—Accidents on Railways.

Sir—I observed in your valuable Journal of the 30th ult., some remarks by "Nauticus," respecting the cause of the accidents which has recently occurred on the Great Western railway, in which he mentions the insufficient manner in which the tires of the locomotive wheels are put on—of which I have exactly the same opinion. It is my belief, that if the ring of the wheel were made a little concave on the outside—say 3-16 of an inch for the centre of concave, which is not a great deal, allowing the ring to be six inches wide—by this construction, the tire would not slip off the ring by any lateral pressure on the flange; likewise, the tire should be made a little convex on the inside, in order to make it fit firmly on the ring. Perhaps some will think that the tire could not be put on the ring sufficiently tight in adopting this plan, and that the tire would not grasp firm enough about the ring; but I have reason to think it will—that is, by means of the tire being sufficiently thick, and heated as hot as it will bear, without injuring the tire—it will expand and contract enough to bring it quite firm about the ring. I think it is very possible to put up the tires too tight; the iron, not allowed to have its natural contraction, gets crippled, and loses its tenacious properties. I believe that iron has a certain point of contraction to give its greatest tenacious gripe, without injuring its cohesive quality; and, as before stated, tires put on the rings of wheels so tight as not to give the iron its proper contraction, weaken it, and make it more liable, by lateral pressure and friction, to slip off, than if put on (if I may term it) tight, and that's all—so I cannot perceive there is any great difficulty in putting on the tires in the manner described: even a very small cavity in the ring, in my opinion, would prevent the tire from losing its grasp.—T. B. UREN. *Camborne, Feb. 9.*

**Protracted Progress of the Railway System.**—Had it not been for the force of prejudice, we might have had the railway system in active operation at a much earlier date, and that even in its present form it was but

the chance of votes of one or two directors that secured its advancement in 1829. All the main lines of railway now existing were projected in 1824 and 1825, and might have been executed before 1830, instead of lingering till nearly the present day; public and legislative ignorance, however, stood in the way, and it cannot be denied that the country has thereby been kept back for many years in its prosperity and advancement. To show more fully the operation of the retarding force of prejudice, we shall give the dates of many railway inventions and the dates of their recognized use:

1754 flanged wheels . . . . .	adopted 1815
1789 edge rails . . . . .	" 1815
1803 malleable iron rails . . . . .	" 1830
1820 parallel rails . . . . .	" 1835
1804 locomotive engines . . . . .	" 1821
1825 do. for passengers . . . . .	" 1834

In 1804 we had malleable iron rails, flange wheels, and the locomotive. We had, in fact, all the elements of the railway system; and had they then been fully adopted, their development must have been much more rapid than it has since been. In 1814, a speed of 20 miles an hour would have been gained by George Stephenson, and we should be at least 20 years in advance. Every part of the system has, however, been kept back by errors and prejudice; and the exertions of Richard Trevithick and George Stephenson retarded by the ignorance and want of reasoning power of their professional brethren. No theorem can be proved more effectually than that the railway system of 1825-1835 might have been carried out in 1805-1815, and it presents one of the clearest cases to be found in economical history of the prejudicial postponement of a valuable institution.—*Railway Register.*

##### Institution of Civil Engineers—Feb. 9.—

**Sir J. Rennie (President) in the Chair.**—The paper read was a description of the "Helder, or Great North Holland Canal," by George B. W. Jackson, Assoc. Inset. C.E. This canal was constructed by the late Mr. J. Blanken, engineer, during the six years between 1819 and 1825, for the passage of frigates and first class merchantmen, and extends from Amsterdam to Nieuwediep, in the Texel. The state of the navigation through the Zuiderzee, in the early part of the 17th century, having become so defective, in consequence of accumulated sand banks and shoals, that camels were necessarily made use of to lift the vessels over the shallows at Pampers, thereby incurring both extreme loss of time and inconvenience, the Dutch government deemed it necessary to consult Mr. Blanken on the possibility of remedying the evil. The engineer accordingly projected the above canal, which has three divisions, the summit level being only 3 ft 6 in. above the outlets; its length is 51 miles; it is 123 ft. 7 in. broad at top, 30 ft. 10 in. at bottom, and 20 ft. 6 in. deep. The pile driving and boring experiments undertaken by him to ascertain the probability of success, show that the original sea shore, being the only really hard ground in the north of Holland, is to be met with at 43 feet under the present surface

of the ground; and, as the foundations of the locks were laid nearly at that depth, the result of the experiments were considered to afford sufficient guarantee for the stability of the works. The character of the soil in that part of Holland is exceedingly treacherous; and it reflects great credit on our foreign neighbors, that they were able to overcome the various difficulties with which they had to contend.

The constructions generally consist of floating and swing bridges, tide locks, passage locks, etc. The floating bridges are peculiar, on account of their flexibility, consisting of two platforms, one fixed on each shore on piles—the end of each of which is worked by sets of double levers, and resting on two boats—so that, when the bridge is required to be opened, both boats are withdrawn, one towards each shore. The Willem lock is 297 ft. 8 in. long, 51 ft. 5 in. wide—the height of the lock wall being 32 ft. 6 in., and the gates being each 29 ft. 5 in. by 29 ft. 4 in. The total cost amounted to £1,500,000 sterling. The time required by vessels to make the passage from Amsterdam to the Helder, varies according to their size and the means of haulage; fly-boats with 6 relays of 4 horses each, making it in 10 hours—whilst large East Indians require 2, 3, and 4 days, according to the wind. The details of construction of the whole of the works were given very freely, and with illustrative drawings. In the discussion which ensued, it was stated, that the canal in this country, which could be contrasted with that of the Helder, was the Caledonian canal, which was projected upon a report by Watt, commenced by Jessop, and in a great part constructed by Telford, a few years previously to the Helder canal. The principal difference between the two consisted in the nature of the ground through which they were cut; the former being excavated entirely out of alluvial deposit, whilst the latter had to be cut out of hard gravel, and, in some cases, rock. An interesting account was given of the mode of forming the spot for the entrance lock at the Inverness and of the Caledonia canal. The object was to carry the work out into deep water. A large mass of earth was deposited in the sea to the full extent intended; upon this mound, a heavy load of material was laid to consolidate the mass.—After settling for a considerable time, the upper mass was removed, the excavation was made for the lock pit, and the construction was effected with comparative facility, and had endured much rough weather since without any symptoms of failure. The superincumbent weight which was removed, being greater than any subsequent strain, there was no danger of the lock ever sinking. The discussion was adjourned until the next meeting (Tuesday, Feb. 16th,) when it was announced that the second part of the paper would be read, treating of "the Method of Forming Fascine Embankments, and Sea Defences."

**Andraud's Railway.**—We were present three days ago at a practical experiment with a new system of railroad, the invention of

M. Andraud, on a convenient piece of ground at No. 4 Passage Cendrier, near the Rue du Rempart. M. Andraud is well known to the public by the experiments which he has performed in the 7 years during which he has been endeavoring to bring the system of railroad travelling by means of compressed air into perfection; but it is only now that he can be said to have arrived at such a point as to be able to exhibit a practical proof of his success, and at the same time remove the objections which have been started to his system. He has laid down a piece of railway about 100 yards, on which is an elegant carriage, impelled by compressed air with a smoothness totally unknown on the ordinary railroads; and, as the air is compressed to only one atmosphere, there is not the slightest danger to the passengers. There is no locomotive, the carriage or carriages—for they may be any number—being impelled by means of a tube laid in the middle of the road, and a pipe by the side, which keeps up the motive power. Independently of the safety to travellers by this system, which has all the advantages of the atmospheric railroads now in use, and none of their disadvantages, which are numerous, the construction of a road on this principle is, we are assured, of a very small cost, as compared with that of a railroad for locomotive engines, and there is an enormous economy in the working. As compared with the expense of the atmospheric principle, which is being established on the St. Germain railroad, the cost of working would, it is declared, be as 1 to 10; and we were assured by some engineers who were present at the experiment, that even as compared with the locomotive engine principle, there would be a saving of at least one half, as the wear and tear of engines is avoided, none being used, and the air is compressed at a very small cost, which was long the desideratum of this system. We hope these statements may be realized; for if they are true, M. Andraud's system must be adopted. The rate of speed may be regulated with ease from 15 to 50 miles an hour, or more if required.

**Railways in India.**—In the House of Commons, on Tuesday evening, in answer to a question from Lord Mahon, Sir J. C. Hobhouse said, that the report of the railway commission, sent out in June, 1845, was presented to the Board of Control on the 4th of July, 1846, and he had no objection to its being laid on the table, together with a minute of the Governor-general, and other communications. He said further, that the East India company and the board had agreed, on certain conditions, to propose to railway companies, but it was not yet known if they had been accepted.

**Continental Glass Manufactory.**—The first window glass manufactory in the province of Hainault commenced in 1625—soon after which two others followed, and there are now no fewer than 36 houses in full blast: 16 work 8 pots, employing 128 blowers; 26 with 6 pots, and 120 blowers; 36 with three stokers; 36 glass cutters and 15 potters—the total cost being £43,384 per annum. There

are five new glass houses being built for 1847, and two new companies forming to commence extensive works in every description of glass. The coal, charcoal, sand, etc., used in the glass manufacture is immense.

**Improvement in the Treatment of Ores.**—We have heard that within the last few weeks, a new process has been introduced by Mr. Oxland, of Plymouth, for the removal of wolfram, a mineral consisting principally of tungstate of iron, from tin ores, by means of which the tin is obtained in better condition, and the tungstic acid is also rendered available for manufacturing purposes. Thus, a substance, which has hitherto been injurious to the produce of tin ores, is actually rendered valuable—at the same time, the quality of the tin is improved. This application has been practically introduced at Drake Walls Tin Mine, near Gunnis Lake, on the river Tamar. The wolfram is found in considerable quantities in Drake Walls.

**Railway Traffic Returns.**—From these returns, it will be seen, that the amount of traffic for the last week, on nearly 2,730 miles of railway, was £133,282, thus accounted for: £65,524 for the conveyance of passengers only, £39,106 for the carriage of goods, and a remainder of £28,652 for passengers and goods together, not respectively apportioned; being an increase over the corresponding week of last year of £17,753, when the mileage was about 1,920.

**Chester and Holyhead.**—There are now 500 masons employed by the contractors for raising the piers for the iron tube over the Menai Straits, about to be erected at the Britannia Rock. These men are earning from 5s. to 6s. per day.

#### CENTRAL RAILROAD.

The following statement of the receipts of the Central railroad, for the month of February of each of the last three years, shows a most gratifying increase of the business of the concern.—*Savannah Republican.*

	1845.	1846.	1847.
Passengers.....	\$4,649 75	\$1,459 25	\$6,321 05
Freights.....	30,422 65	14,910 00	35,565 54
Mail.....	1,315 00	1,715 00	1,715 00
Total.....	36,787 40	21,084 25	44,601 59

#### Railroads at the Eastward.

The railroad "fever" in Maine has not yet subsided—and we are glad to learn, as we do from the journals, there, that the interest in this subject does not flag, as yet. The Augusta Journal, commenting upon the intended progress of railroads in Maine, says—"After we get a road from Portland to Augusta, the work on which will be commenced as soon as the snow is off and the frost is out, the next step will, no doubt, be the road to Skowhegan.—There is a great water power at that place, and so there is at West Waterville on the outlet of Snow Pond, not to mention Ticonic Falls on the main river, already famous far and near. We are told a very level road may be had to Skowhegan, from which place there can be no difficulty in carrying the road further up the river hereafter. We have strong faith to believe it will be carried as far as Anson in a few years. Equally strong is our conviction that a road will be made on the Androscoggin, from Bath to Livermore or Canton—perhaps further up."

AMERICAN RAILROAD JOURNAL.

Published by D. K. MINOR, 105 Chestnut St., Philadelphia.

Saturday, April 17, 1847.

Kennebec and Portland Railroad.

The attention of contractors is called to the notice for letting 28 miles of this road on the 15th of May next. It will also be observed that 21 miles more will be ready for bids by 15th June. This looks well for our eastern friends. They are resolved to make good in New England, what has been well said in old England, viz: "that the railway system will progress until every town, of any considerable note, has its railway facilities."

**TO CONTRACTORS.—KENNEBEC AND PORTLAND RAILROAD.**—Proposals will be received at this office until the 15th of May, for the *Grading and Masonry* of 28 miles of this road, extending from North Yarmouth to Bowdoinham, and the Branch Road from Brunswick to Bath, including the masonry for the Bridges across the Androscoggin, New Meadows and Cuthance rivers. The line of road and the plans and profiles will be ready for examination on the 10th of May; after which time any information in relation to the work can be had at this office, or of the Resident Engineers on the line of the road.

Persons unknown to the officers of the company, must accompany their bids with satisfactory evidence of their ability to execute the work.

The remainder of the line from Bowdoinham to Augusta, 21 miles, will be ready for contract about the 15th of June; of which due notice will be given.

Massachusetts Annual Reports.

We give, this week, another of the Massachusetts Annual Reports.

Nashville and Chattanooga Railroad.

Some of our readers will probably recollect that we endeavored, some time since, to urge the importance—especially to Nashville and Middle Tennessee—of the early construction of a railroad from the Tennessee river—at the termination of the Georgia railroads—to Nashville, and thence to the Mississippi river. By referring to the Railroad Journal for 16th and 23d of October, 1845, and other numbers, it will be seen that we have devoted considerable space to, and took a warm interest in, such a work. And it affords us much pleasure now to refer again to the subject, and to lay before our readers the Report of J. Edgar Thomson, Esq., who has recently completed the preliminary surveys of the route from Chattanooga to Nashville. This report, it will be seen, makes out a very favorable line—the greatest elevation being only 1165 feet above tide water, with only two tunnels.

The estimated cost is \$2,810,000, for 152 miles—an amount too low, we think, under present circumstances, as the price of iron must be higher; yet, as Mr. Thomson intimates, the work may be done by their own people, and the iron may be made within the State, thus giving additional employment to the people, and new investment to their capital—and therefore there should be no delay in the movements of those who see, and feel, and appreciate, the value

of a well constructed railroad, through that region of country, to the people of Tennessee.

The views, and suggestions, of the engineer, are those of a gentleman of great experience in the construction of railroads, through a thinly settled country, and they are therefore, in relation to this particular work, entitled to high respect—and we know of few men, indeed, who are better qualified to carry them out, with limited means, than Mr. Thomson.

Central Pennsylvania Railroad,  
And its Chief Engineer.

We find in the U. S. Gazette of Saturday last, the following paragraph, viz:

"THE PENNSYLVANIA RAILROAD COMPANY.—We learn that the Directors of this company held a meeting yesterday for the purpose of making choice of Engineers, and their election fell as follows:

JOHN EDGAR THOMSON, Chief Engineer.  
Edward Miller, } Associate Engineers.  
William B. Foster, Jr. }

"These gentlemen are eminent in their profession, and under their direction the work cannot fail to be of the most approved character. The organization being now completed, so far as the principal officers are concerned, we may look for a speedy commencement of operations."

We agree with the Gazette, that if indomitable perseverance, in connection with other necessary qualifications, is any recommendation to a man, then has the company made a good selection of a chief engineer—with the other gentlemen we are less acquainted—yet report speaks well—and we look with confidence to a speedy commencement of the work, and eminent success in its completion.

Table of Railroads.

The following letter contains several corrections to our "Table of Railroads," worthy of note, for which we are obliged to the writer. If others, who have information of this kind, will take the trouble to put it in shape, and send it to us, we shall be able to add greatly to the value of the table. In relation to the query of the writer, as to the propriety or economy of constructing "cheap roads," to be worked by horse power, connecting villages—3 to 10 miles distant—with main lines of railroad, we can only say that such experiments have not, we believe, been very successful where attempted. Temporary roads require constant and heavy repairs, in proportion to their cost—and we seldom find, even small villages inclined to be satisfied with any thing less than their more important neighbors.

As to the merits of the "Forwarding" as carried on by the "Market street" gentlemen, upon the "State Works of Pennsylvania," we cannot say much—not being at all acquainted with its results, but we are quite sure that such a system will not work smoothly on roads managed by a company—Nor, indeed, do we think it can work well on any railroad, where there should be the strictest discipline among the subordinates—and the most perfect harmony between all the different departments—which cannot be where there are several distinct interests: as there must be where there are several distinct companies, or individuals working the road.

As to the "division of benefits," arising from the operations of railroads, we are decidedly of the opinion that those who use them—either for travel or transportation—to any considerable extent—come in for a larger "share of benefits" than those who invest their capital. The man who travels from Boston to Buffalo—or any equal distance—or sends a ton of freight on a railroad, derives more benefit than the man who owns \$250 of stock in almost any railroad in the country—especially if his time is of any value. And as to the term "monopoly," as applied to railroads generally, it has no meaning, as every man who desires, can own stock—and there

is but one single case within our knowledge, in the country where competing lines may not be built, if the business requires, and the people will build them; therefore they are not monopolies—as the term is usually understood.

The question "why can you not publish a monthly volume, as is done in London," etc., may be well answered in the Yankee manner—viz., by asking another—why will not the people in this country, interested in railroads, sustain the publisher of such works, as they do in England? When they will, then they can have them.

RAILROAD TABLE CORRECTION.

HANOVER, N. H., April 3, 1847.

Editor of the American Railroad Journal:

Sir—According to a request you made in the Journal of the 13th, of "each of your readers," I beg leave, as one of the unprofessional readers, to make some additions for your "Table of Railroads," etc.

No. 11. Central—10. Connecticut River, Burlington, Vt.

This is all right as far as the continuous line from Boston to Burlington is concerned—but the Central extends to from where No. 10 joins it (on the west bank of the Connecticut river, and to and at the mouth of White river) in the valley of the Connecticut, to Windsor, 14 miles. The Sullivan railroad joins No. 11 here, and extends, in N. Hampshire, to the intersection with the Cheshire—No. 15—before it crosses to Bellows Falls Village. As the west boundary of the New Hampshire extends to the Western bank of the Connecticut, the point of union between a Vermont and a New Hampshire road, is at the line; and the bridging of the Connecticut river is done by the New Hampshire road.

There is a road not in your list—called, if I mistake not, the "Boston, Concord and Montreal." This is now under construction from Concord to Meredith, and is independent of the Northern, No. 10.

The "Connecticut and Passumpsic railroad," from Canada line in Derby, has had a little work done upon it in Bradford, Vt. It is, however, still undetermined, by what route it shall be connected with Nos. 10 and 11—whether on the Vermont side of the Connecticut, to White river, or crossing at Oxford, N. H., come down via Lyme and Hanover to No. 10, in the valley of the Connecticut river.—The expense of a bridge at Oxford, must, I think, be much less than of one over White river.

There is a road now under survey (or was last fall) from Greenfield, Mass., to Brattleboro, Vt., not in your list.

A connected view of all the railroads from the N. York and New Haven, up the Connecticut valley, to Canada line, would be useful to New England and New York business men.

In 1829-30-31, I was acquainted somewhat with a small, but very useful, road from the Goochland coal pits, in Virginia, to James river, (north side.) This was of a very honorable order—bar iron on wooden rails—narrow track—a few (6 or 8 1/2) miles in length—and cost, if I recollect, about \$1000 a mile. This, on account of its early construction, might be worthy of notice—and a query, whether small villages within 3 to 10 miles of a main track, should not be encouraged to build cheap roads to connect with this, to be worked with horse power. Information upon the cost of construction of such roads would be valuable to the community, as with a road of easy grade, the business of a village might be most economically transacted.

What are the merits of the system of "Forwarding," so conspicuous in Market street Philadelphia, in connection with the Pennsylvania railroads?—

Might it not be usefully adopted in New England and pay a fair business commission to thousands not of the corporation, and thus, by division of benefits, interest a larger number of citizens in the support of railroads, and diminish greatly the opposition to them as monopolies. \* \* \*

Why can you not publish a monthly volume, as is done in London? about 4 by 5 inches (or 5 by 5) of all the railroads in the land—distances—fares and times through, and intermediate, connections, etc.—with a map. Such a manual, I believe, has a great sale abroad, at depots and in trains of cars, and includes all European roads. Is not No. 31 of your Table finished? Cars have run through since last November.

**Petersburg and Greenville and Roanoke Railroads.**  
OFFICE PETERSBURG RAILROAD CO. }  
March 27, 1847. }

DEAR SIR—I send you the following items concerning the *Petersburg and Greenville and Roanoke Railroads*, to fill up the blanks in your table of "Railroads in the United States:"

*Petersburg Railroad* runs to *Weldon*, N. C., and not *Blakley*, as in the table.

Gross revenue for 1845.....\$147,630 50  
Net revenue for 1845.....68,990 34  
Dividend 5 per cent.

Gross revenue for 1846.....\$163,093 20  
Net revenue for 1846.....75,960 97  
Dividend 6 per cent.

*Greenville and Roanoke Railroad.*  
Gross revenue, 1845.....\$25,368 94  
Net Revenue, 1845.....6,074 86  
Dividend none.

Gross revenue, 1846.....27,364 24  
Net revenue, 1846.....7,507 48  
Dividend none.

The profits of the *Greenville and Roanoke railroad* are applied to paying off the debt. Up to July, 1846, \$54,365 of the debt had been paid off, reducing the debt to \$25,109.

The *Petersburg* company, besides paying dividends as above, is paying off about \$30,000 of its debt per annum. The debt will all be paid off this year. I remain, respectfully, yours,

H. D. BIRD, President.

The above statement is very acceptable. It enables us to correct errors and make additions.—Will others, who have the means, do likewise?

#### Central Ohio Railroad.

It will be seen from the following letter, that there is a movement in Ohio for a railroad from the Ohio, at *Pittsburg*, or *Wheeling*, in the direction of *Columbus*. This is a matter of course. There must be a railroad through that part of the State, intersecting all the other works between the lake and the Ohio, and we hope to hear soon that the entire line is under contract. *Philadelphia* should look to it.

"I take the liberty to enclose to you, says the writer, by to-day's mail a charter granted by our last Legislature for the "Central Ohio Railroad Company." It looks to a connection, as you will see, with either *Philadelphia*, by way of *Pittsburg* and the "Pennsylvania Central Railroad," or *Baltimore*, via *Wheeling*, or near there, and the *Baltimore* and *Ohio* railroad.

"The latter, as being already partly in operation, appears the most likely to progress to its termination, and completion—and, consequently, our people look to that as the most probable point of termination.

"An engineer will commence a survey of the route from *Newark* to *Zanesville* on the 1st of March—with a view to locate the road. Beyond the object

of keeping you advised of the progress of railroad matters here, my aim in writing you at this time, is to call your attention, and through you the attention of other citizens of *Philadelphia*, and *Pennsylvania*, to the advantages to a commercial Eastern city of a continuous railway passing through such a portion of productive country as the *Muskingum*, *Licking*, *Scioto* and *Miami* valleys, in this State, to *Cincinnati*, and thence to *St. Louis*. An article in your *Journal* of the 13th February, from a *New Orleans* paper, shows the estimate which they place upon it. A proper attention to this matter at *Philadelphia* and *Pittsburg* will secure this trade. If they neglect it, others will profit by that neglect, and secure the results.

"I write this much, that the matter of such importance may be placed before those persons who will take an interest in it, in proportion to its moment.

"Is there any certainty that your "Central road" will be made? If there is not, (as some say,) then we do not wish to go to *Pittsburg*—and we must look to a communication with the *Baltimore* and *Ohio* railroad."

In reply to the question of our correspondent, we unhesitatingly say that the "Central railroad" will be built, and that, too, with very little delay.

#### Troy and Greenbush Railroad.

The following statement exhibits the number of passengers, and the amount of passenger and freight earnings, for each month from the opening of the road to the close of the year 1846.

Date.	No.	Amount.	Freight.	No.	Amount.	Freight.
Jan'y.	10,729	\$1,235 90	\$1,597 94	10,729	\$1,235 90	\$1,597 94
Feb'y.	9,580	1,192 94	1,310 30	9,580	1,192 94	1,310 30
March	12,905	1,643 35	1,383 60	12,905	1,643 35	1,383 60
April.	21,134	2,637 43	1,171 81	21,134	2,637 43	1,171 81
May.	21,827	2,611 47	1,020 02	21,827	2,611 47	1,020 02
June.	25,381	3,141 22	879 71	25,381	3,141 22	879 71
July.	33,204	4,000 41	925 73	33,204	4,000 41	925 73
August	36,219	3,801 74	930 52	36,219	3,801 74	930 52
Sept.	36,091	3,734 91	933 63	36,091	3,734 91	933 63
Oct.	23,925	3,347 03	1,698 65	23,925	3,347 03	1,698 65
Nov.	18,420	2,741 83	1,570 69	18,420	2,741 83	1,570 69
Dec.	16,620	1,736 94	2,601 48	16,620	1,736 94	2,601 48
	393,711	\$12,900 86	\$3,647 39	393,711	\$12,900 86	\$3,647 39

From January 1st to August 17th, the fare over the road was 12½ cents. From that date to December 7th, it was 15 cents. From that time it has continued at 20 cents.

#### Trade of the Central Railroad.

We lately published a statement from an English journal, in reference to the vast amount of live stock conveyed to London upon the principal railways entering that city. A writer in the *Philadelphia United States Gazette*, urging the importance to *Philadelphia* of a continuous railroad connection with *Pittsburg*, estimates the number of beef cattle that would pass over the road from *Pittsburg* to *Philadelphia* at 50,000 per annum; for each of which, it is stated, the drovers would willingly pay \$10—making an aggregate of \$500,000, from this item

alone. It is believed, too, continues the writer, that 500,000 barrels of flour would seek an Atlantic market by the contemplated railroad; and the receipt from the transportation of foreign emigrants from the seaboard to the west is set down as an item of considerable importance.

#### Cost of Canal Repairs.

We find in the last number of the *Rochester Democrat*, the following tabular statement in reference to a subject of interest at this time. It contains much interest to those who desire to offer proposals for portions or sections of canal repairs—as it gives the average cost of repairs per mile, for several years:

	Erie.	Oswego.	Cayuga & Seneca.	Chemung.	Crooked Lake.	Chenango.	Genesee Valley.
1828	\$513	\$239	....	....	....	....	....
1829	529	361	1,386	....	....	....	....
1830	461	349	247	....	....	....	....
1831	382	254	152	....	....	....	....
1832	743	340	243	....	....	....	....
1833	746	313	274	666	....	....	....
1834	976	338	401	691	231	....	....
1835	693	453	440	359	445	....	....
1836	704	1,434	1,368	361	592	....	....
1837	830	1,608	1,297	393	776	201	....
1838	851	1,371	861	364	556	214	....
1839	676	679	1,063	391	444	177	....
1840	827	915	1,124	335	592	159	125
1841	581	694	633	631	1,129	160	220
1842	732	827	719	933	1,014	195	341
1843	676	623	497	386	505	155	292
1844	844	752	656	344	493	164	299
1845	907	1,227	945	485	595	195	325
1846	843	1,409	560	395	663	190	334

#### The Western Telegraph.

MR. CASE—one of the proprietors under the patents—comes out in a late number of the *Cincinnati Inquirer*, with an explanation and statement, finally agreed upon, in regard to the *Western* and *Southwestern* lines of telegraph, the existence of which has not only hitherto retarded the progress of the work west of *Pittsburg*, but induced many to doubt whether it would not be abandoned. It seems now almost certain, says the *Cincinnati Gazette*, that we shall have a line in operation to this city in July next; for surely, the patentees will not refuse their assent to an arrangement which secures them advantages from early construction and in the adjustment of law suits, equal to any thing they give up to effect the settlement.

The plan for making a separate company for constructing the line from *Pittsburg* to *Cincinnati* and *Louisville*, secures the application of the funds raised along that line to its construction and support, and, by bringing the force of both Mr. O'Reilly and Mr. Case to engage, at the same time on different parts of the same line, the early completion of the whole is made sure.

The forming of a distinct company to construct the line from *Louisville* to *New Orleans*, in like manner secures the application of the funds raised on that line to its construction, and places in the subscribers the control of it when done. The same is the case on the line from *Louisville* to *St. Louis*.

The connection on all these lines with each other, is provided for; and the connection is also secured with the *Buffalo* line, with the *Pennsylvania* line, and with the lines east from *Washington* to *Baltimore*, *Philadelphia*, *New York*, and *Boston*, and even to *Quebec*. The stockholders are protected from responsibility beyond the amount they subscribe, and there is little room to doubt that the stock will yield a large profit as an investment.

There is no doubt now that we shall soon have intercourse with *New Orleans*, by means of this in-

\* Road opened for travel June 13th, and until July 4th, only two trips each day were made.

vention. The subscriptions in New Orleans, to the stock of the company, who propose to construct the telegraph between that city and Washington amounted, at the last accounts, to \$50,000.

#### St. Louis Railway.

The Senate of Illinois postponed indefinitely the bills allowing the right of way to the St. Louis and Cincinnati railway, which had previously passed the House. The Legislature has since adjourned, and does not assemble again short of two years, unless specially convened, therefore the right of way question may be considered as settled for the time being. The people of Alton, Ill., seem well pleased, says an exchange, with the defeat of this St. Louis project, so called, as one designed to prejudice the Illinois city for the benefit of the foreign city of St. Louis! The route from Vandalia east to Terre Haute, would be about the same, whether the road terminated at Alton or St. Louis. Now if foreign capital can be made available to construct that part of the road common to both cities, much against the interest of the State of Illinois, along the general line, to reject this capital, and go without any road, because the same capitalists are unwilling to raise money to continue the road thence to a terminus on the Mississippi, where they have no interests. We see no good objection to allow each city to connect with the common line. The question with Alton, in that case should be, will Alton be more benefited by a railroad connecting it with the Atlantic, if St. Louis has one also, than without any road at all.

#### Railroads in Ohio.

The people of the "Buckeye" State have at length become aroused to the importance of railroad communication over the extent of that rapidly growing region—and public meetings are being held at different points, to consider the subject, in earnest.—The question is embodied in the contest for the approaching election there, and we perceive by the Ohio papers, that the motto, "railroad or no railroad" is a common affair. The Ohio State Journal, at Columbus, one of the leading publications, says:

"The steam is rising. The people of Columbus, who have been sleeping so profoundly, while the enterprize of their neighbors has been actively employed, are now beginning to arouse themselves, to shake off their lethargy. But they seem to awaken from their Van Winkle repose, to adjust some ancient feud which had occupied their attention previous to their slumbers; and their wrangling about 'South End,' and 'North End,' is unintelligible jargon to one who has not been familiar with their household affairs for years past. No matter—let them settle all these affairs to their own liking, so that they be prepared to act efficiently and in concord, when the day for action arrives.

"Knowing nothing of the merits of the abstruse questions which seem to divide our fellow citizens into geographical 'enders,' we can of course take no part in such controversies; and yet we could do no less than allow their respective claims to be heard through our columns, couched as they are in respectful and temperate language. We would fain hope that by such discussion and mutual explanation, an harmonious understanding may be attained, and that all ends of the city may vie with each other in advancing the common welfare. Personally, we have little or no interest involved in the question of tax or no tax, railroad or no railroad, which is submitted to the electors of this city and county for their decision on next Monday week; and we have too much respect for the understanding of the electors aforesaid, to suppose that they cannot discern their own interests, without any promptings from us.

"We will barely remark in this connection, that the question for us to decide is not whether railroads shall or shall not be constructed in our vicinity. That question is already decided, and placed beyond our control. Such roads will be made—are now making; and the question for us to determine is, simply whether we will be partakers in the benefits resulting from their construction? Shall Columbus be a commercial mart, where the people of the country shall find a ready sale for their produce, and which shall diffuse the benefits of its capital and enterprize all around? Or, shall it and its inhabitants be made tributary to Newark, or Berkshire? Let that question be understood and decided."

#### Plank Roads.

We have published several paragraphs, and have alluded often, latterly, to the interest which is evinced—in the State of New York particularly—in reference to the subject of plank roads. This subject is exciting a deep interest in the minds of many friends of internal improvements in this country; and, as it has been, by the recent action of the New York Legislature, placed more permanently before the public, a sketch of the history and adaptedness of such roads for convenience and utility will not be unacceptable to our readers.

The system of plank roads originated, we believe, in Canada, in 1835, and owes its existence to the difficulty experienced by the commissioner of highways to better the condition of a few rods of quicksand. After trying various expedients without success, he finally conceived the idea of sinking heavy timber and planking it, similar to bridging, except that he filled the vacancy between the sleepers, or sills, with stone and earth. He watched the operation of it with interest, and found that he had overcome the quicksand trouble. He then tried the experiment over a marshy soil, and it worked well; and from these he conceived of the efficacy of a common road made of plank.

A company was formed soon after, says a writer in the Merchants' Magazine, for the construction of a plank road from Toronto to the river Rouse, which was finished in 1839. It met public expectation.—Another was built from Whitby to Lake Ontario; one from London to Godrich; another from Coburg to Rice Lake; one finished from the rapids, on the St. Lawrence, from Coto de Lac to——, about 16 miles long; and one from Longville to Chambly, commencing three miles below Montreal, which is 15 miles long. They have been sufficiently tested to the satisfaction of all, as being the best roads ever made for ordinary passage, and capable of being used next to railroad, in expedition to travel.

In the United States but little has ever been known of them, until three years ago, except by visitors to Canada, who always spoke of them in high commendation. The Rochester Democrat, in 1843, contained several letters in reference to them, written by a gentleman of that city, who was travelling through Canada. The letters were extensively copied by the press, and the adoption of them urged. Since then charters have been obtained for the construction of three roads in the State of New York viz: one from Buffalo to Aurora; another from Buffalo to Lancaster; the third from Salina to Brewerton. The last mentioned is the only one now constructed in the United States. It is 12½ miles long. George Geddes, of Onondaga county, was the engineer. As the subject is becoming a topic of much interest throughout this State, the mode of construction is of interest. We extract from a letter of Mr. Geddes to a friend:

"The planks are of hemlock, eight feet long, and

four inches thick, laid crosswise of the road, on sills four inches square. The earth is broken up and made fine, the sills are bedded into it, and the surface graded smooth; the plank are then laid on the sills, care being taken that the earth is up to and touches the plank at every point. This is important, for if any space be left for air under the plank, or alongside the sills, dry rot follows. I saw, in Canada, a road that had been worn out, and was being re-built. The sills were good, and the plank were sound on the under side, save where air had supplied the place of earth, and there they were destroyed by rot. The plank having been laid, the next thing is to grade a road, some ten or twelve feet wide on one side, and two or three on the other, by taking earth from the ditches on each side, and bringing it, by a ditch-scraper, just up to and even with the upper side of the plank, so that if a wheel runs off the track, it passes upon a smooth surface of earth. The ends of the plank should not be laid even, but a part should project from two to four inches by the general line, to prevent a rut being cut just along the ends of the plank. If the ends of the plank are even, and a small rut is made, the wheel of a loaded wagon will scrape along the ends for some distance before it will rise up to the top of the plank, unless the wagon moves in a direction nearly across the road; but if the wheel cannot move two feet forward without coming square against the edge of a projecting plank, the difficulty of getting on the road is avoided. It is not necessary to pin or spike the plank to the sill.

"Perfect drainage must be secured, and to that end the ditches must be deep and wide, and good sluices wherever water crosses the road. This is the important point—drain perfectly.

"As to the cost of such a road, I will answer you by giving you a copy of my estimate of the Salina road, which very considerably exceeded the actual cost. It is proper to inform you that this road was made upon the bed of an old road, filled in many places with stone and logs. The right of way cost us nothing. The estimate was for plank three or four inches thick. Where we laid two tracks, we laid one of them with three inch plank, but the main track was four inches thick. It is economy to use thick plank, if the travel is sufficient to wear out the road, but if it is to rot before it is worn out, then, of course, thin plank should be used. The Canada roads are generally three inches thick, and are made of pine, and last about eight years.

The following is the estimate of the cost of a single track of plank road, eight feet wide for one mile: Sills 4 inches by 4 inches.....14,060 ft. b.m. 8 feet width of plank 3 in. thick.....126,730 "

	140,800 feet, at
\$5 per thousand.....	\$704
Laying and grading, \$1 per rod.....	300
Engineering, superintendence, etc., 10 per cent. 102	
Gate houses, say.....	100
For 4 inch road, add 42,940 feet, at \$5 per M. .	\$211
Sluices, bridges and contingencies.....	\$3
Total.....	\$1,500

The Longuil and Chambly plank road in Canada, was re-laid the past season, after a wear of eight years. The income of the road paid a dividend of 10 per cent. on the cost of the first construction, and reserved a sufficient sinking fund to pay for re-building.

Fourteen applications are made to the present session of the New York Legislature, for charters to build roads of this description—four of them to lead from the city to Rochester.

### Baltimore and Ohio Railroad Report.

(Continued from page 536)

## STATEMENT 12.

*Tabular Statement, exhibiting in detail the operations and various actual expenses of working the "Main Stem" of the Baltimore and Ohio Railroad, during the year ending Sept. 30th, 1845--and the amount of receipts for transportation of passengers, tonnage, mails, etc., during the same period.*

HEADS OF EXPENDITURE.	Miles run by locomotives.			Number of passengers carried one mile.	Cost per Passenger per mile.	Cost of conveying passengers.	Number of tons carried one mile.	Cost per ton per mile.	Cost of transporting tonnage.	Aggregate cost of working the road.
	With Passenger Trains.	With tonnage & company's materials.	Total.							
Motive Power by Steam—including actual cost of repairs and renewals of locomotives and tenders (\$40,312 68)—fuel, (6,811½ cords of wood and 5,437-8 tons of coal, including cost of preparation for engines, \$29,464 77)—oil for locomotives and tenders, (6,849 gallons, \$6,061 36)—cotton waste, (6,807 pounds, \$330 78)—and wages of engine-men and firemen (34,072 78).....	150,572	408,146	58,718	9,155,325 112,595	0-295	\$27,015 32 +6,693 69	11,157,931 119,522	0-656	\$72,227 07 +11,136 64	100,242 47 17,830 33
Motive power by horses—in the streets of Baltimore.....										
Totals and averages of motive power.....				9,967,920	0-373	33,709 01	11,277,453	0-748	84,363 69	118,072 70
Repairs of railway, less cos of repairing breaches (\$313 49) and including decrease in value of stock for repairs (\$706 15)					0-258	23,871 65		0-574	64,705 88	88,577 53
Repairs and renewals of bridges, (less cost of improvements and increase of stock of repairs, the first being \$14,802 11, and the latter, \$3,613 49).....					0-108	9,990 54		0-240	27,080 10	37,070 64
Repairs of depots.....					0-020	1,365 33		0-045	5,056 09	6,921 42
Repairs of water stations, less increase of stock for repairs, \$500.....					0-003	276 50		0-007	749 44	1,026 94
Pumping water.....					0-007	621 20		0-015	1,683 80	2,305 00
Watching bridges.....					0-020	1,800 13		0-043	4,879 37	6,679 50
Repairs and renewals of cars, corrected for difference in value of materials for repairs on hand at the commencement and close of the year, and embracing \$1,970 94 for repairs of coal cars, which item was included in that of "Coal Trade," in the secretary's statement.....					0-119	11,020 36		0-241	97,227 75	38,248 11
Transportation department, embracing salaries of superintendent, agents and clerks, (\$9,071 21)—conductors and brakemen of passenger trains, (\$4,667 59)—burden trains, (\$7,522 85)—labor at depots, (\$5,387 85)—oil and grease for cars, (\$3,457 22)—and contingencies, (\$5,719 12)....					0-118	10,956 49		0-128	24,569 35	35,525 84
General expenses, which embrace salaries of president, secretary, and clerks in secretary's office, office rent, counsel's fees, taxes, insurance on property, etc.....					0-025	2,375 91		0-057	6,440 08	8,815 99
	150,572	408,146	558,718	9,967,920	1-041	\$86,487 12	11,277,453	2-188	246,755 55	343,243 67

## REMARKS.

Besides the tonnage transported above, and for which the company have received pay, there have been hauled of materials for repairs of railway and bridges, and of fuel for locomotives, etc., equivalent to 703,924 tons one mile;—which amount, if added to the 11,157,931 tons hauled one mile by locomotives as above stated, and their sum divided by the number of miles run by locomotives with tonnage, trains, will show the average net load of each engine to have been 292 tons, which is 753 tons greater than the average of the previous year.

There have been carried over the Winchester and Potomac railroad, in the cars of this company, equivalent to 507 420 tons one mile.

The average number of passengers in each train has been 61.

The average charge for the transportation of tonnage 3.106 cents per mile.

2. The average charge for the conveyance of passengers, 3.151 cents per mile.

The average cost for repairs and renewals of locomotives, 7.815 cents per mile run with trains.

The average charge for transportation, exclusive of coal, 3.468 cents per mile, run with trains.

The average cost of running the trains, exclusive of horse power in the streets of Baltimore, has been 58 2-10 cents per mile.

The average cost of running the trains, inclusive of horse power in the streets of Baltimore, has been 61 3-10 cents per mile.

The expenditures common to both passenger and burden traffic, have been divided in the proportion of the number of miles run by locomotives, with the trains of each description; the greater speed of the passenger trains being considered as fully, if not more than equivalent, to the somewhat greater average weight of the tonnage trains.

**JAMES MURRAY.**

**Engineer of Machinery and Repair.**

## RECEIPTS AND EXPENSES.

Received for the conveyance of passengers,	\$291,011 85
" " transportation of tonnage,	350,308 11
" " United States mail,	43,305 00
" " use of main stem to relay house by passengers Washington branch,	33,198 93
" " " " tonnage " "	15,188 29
" " tolls upon Harper's Ferry viaduct,	1,436 89
" " use of cars on Winchester and Potomac railroad,	3,224 48
	<hr/> \$738,603 18
Expended for the conveyance of passengers and mails,	\$96,487 19
" " transportation of tonnage	946,755 55
	<hr/> \$343,242 67
Showing the net revenue to have been,	\$395,360 51
<i>To which, in order to show the same results as exhibited by Statement B, in the 19th Annual Report of the Baltimore and Ohio Railroad Company:</i>	
Add cost of repairs of coal cars, which item is included under the head of "Coal Trade,"	1,970 94
And amount of decrease in value of materials on hand for repairs of railway and burthen cars,	1,067 39
	<hr/> \$398,398 97
Making together an aggregate value of	
And deduct therefrom, extraordinary expenses, as follows, viz:	
Expenditures within the year, for repairs of breaches in the road by freshets, west of Harper's Ferry,	\$313 49
For permanent improvement in bridges, and increase in stock of materials, for their repair,	18,445 00
For increase in the stock of materials for repairs of water stations,	500 00
" " " " " passenger cars,	208 91
For increase in duplicate parts of, and permanent improvements in locomotives,	4,169 03
	<hr/> 23,637 03
Surplus same as shown by statement B, above referred to,	\$374,761 74

\* These expenditures include the cost of conveying passengers and tonnage through the streets of Baltimore, for the Washington Branch road, as well as those of the main stem.

## MASSACHUSETTS ANNUAL RAILROAD REPORTS.

Return of the Connecticut River Railroad Co., under the Act of April 16, 1816.

Capital stock.....	\$1,000,000 00
Increase of capital since last report.....	
Capital paid in, per last report.....	477,156 50
Capital paid in since last report.....	160,753 50
Total amount of capital stock paid in, [see below].....	637,910 00
Funded debt, per last report.....	
Funded debt paid since last report.....	
Funded debt, increase of, since last report.....	
Total present amount of funded debt, [see below].....	167,000 00
Floating debt, per last report.....	25,000 00
Floating debt paid since last report.....	
Floating debt, increase of, since last report.....	175,760 96
Total present amount of floating debt, [see below].....	200,760 96
Total present amount of funded and floating debt.....	367,760 96
Average rate of interest per annum on do.....	6 per cent.

## COST OF ROAD AND EQUIPMENT.

For graduation and masonry, per last report.....	159,046 42
For graduation and masonry, paid during the year.....	132,639 82
Total amount expended for graduation and masonry.....	\$291,685 24
For bridges, per last report.....	18,900 00
For bridges, paid during the past year.....	14,666 99
Total amount expended for bridges.....	33,566 99
For superstructure, including iron, per last report.....	165,388 81
For superstructure, including iron, paid during the past year.....	234,627 97
Total amount expended for superstructure, including iron.....	400,016 78
For stations, buildings and fixtures, as per last report.....	22,055 05
For stations, buildings and fixtures, paid during the past year.....	29,476 88
Total amount expended for stations, buildings and fixtures.....	51,531 93
For land, land-damages and fences, per last report.....	94,831 98
For land, land-damages and fences, paid during the past year.....	52,857 36
Total amount expended for land, land-damages and fences, [including over \$50,000 for depot lands, a large part of which will be realized from sales].....	147,689 34
For locomotives, per last report.....	15,300 00
For locomotives, paid during the past year.....	13,000 00
Total amount expended for locomotives.....	28,300 00
For passenger and baggage cars, per last report.....	4,300 00
For passenger and baggage cars, paid during the past year.....	7,900 00
Total amount expended for passenger and baggage cars.....	11,500 00
For merchandize cars, per last report.....	5,000 00
For merchandize cars, paid during the past year.....	3,190 00
Total amount expended for merchandize cars.....	8,190 00
For engineering and other expenses, per last report.....	27,451 37
For engineering and other expenses, paid during the past year.....	11,310 23
Total amount expended for engineering and other expenses.....	38,761 60
Total cost of road and equipment, [exclusive of interest].....	\$1,010,541 88

## CHARACTERISTICS OF ROAD.

Length of road.....	35.9 miles.
Length of single track.....	28.05 miles.
Length of double track.....	
Length of branches owned by the company, stating whether they have a single or double track.....	2.35, single track.
Weight of rail per yard in main road.....	56 pounds per yard.
Weight of rail per yard in branch roads.....	56 lbs. per yd. [places.
Maximum grade, with its length in main road.....	18, 9 miles in 7 separate
Maximum grade, with its length in branch roads.....	18, 6900 feet in 2 separate [places.
Total rise and fall in main road.....	354 feet.
Total rise and fall in branch roads.....	28 feet.
Shortest radius of curvature, with length of curve in main road.....	900, curve 700 feet long.
Shortest radius of curvature, with length of curve in branch roads.....	714, curve 1300 feet long.
Total degrees of curvature in main road.....	1321.
Total degrees of curvature in branch roads.....	449.
Total length of straight line in main road.....	26 1.8 miles.
Total length of straight lines in branches.....	1 mile.
Aggregate length of truss bridges.....	2170 feet.
Whole length of road unfinished on both sides.....	

## DOINGS DURING THE YEAR.

Miles run by passenger trains, [carrying freight].....	50,825
Miles run by freight trains, [separately].....	1,950
Miles run by other trains.....	750
Total miles run.....	62,525

Number of passengers carried in the cars.....	185,190 1
Number of passengers carried one mile.....	1,309,800
Number of tons of merchandize carried in the cars.....	17,247
Number of tons of merchandize carried one mile.....	198,214
Number of passengers carried one mile, to and from other roads.....	
Number of tons carried one mile, to and from other roads.....	
Average rate of speed adopted for passenger trains, including stops.....	21.6 miles per hour.
Average rate of speed adopted for freight trains, including stops.....	15 miles per hour.
Estimated weight in tons of passenger trains, including engine and tender, but not including passengers, hauled one mile.....	1,854,575
Estimated weight of merchandize trains, including engine and tender, but not including freight, hauled one mile.....	437,925

## EXPENDITURES FOR WORKING THE ROAD.

For repairs of road, maintenance of way, exclusive of wooden truss bridges and renewals of iron.....	\$2,460 89
For repairs of truss bridges.....	
For renewals of iron, including laying down.....	
For wages of switch-men, gate-keepers and flag-men.....	480 00
For removing ice and snow.....	458 71
For repairs of fences, gates, houses for flag-men, gate-keepers, switch-men, tool-houses.....	
Total for maintenance of way.....	\$4,399 00

## MOTIVE POWERS.

For repairs of locomotives.....	\$1,299 08
For new locomotives to cover depreciation.....	
For repairs of passenger cars.....	242 97
For new passenger cars to cover depreciation.....	
For repairs of merchandize cars.....	247 94
For new merchandize cars to cover depreciation.....	
For repairs of gravel and other cars.....	95 00
Total for maintenance of motive power.....	\$2,884 99

## MISCELLANEOUS.

For fuel and oil.....	4,947 82
For salaries, wages and incidental expenses, chargeable to passenger department.....	5,340 18
For salaries, wages and incidental expenses, chargeable to freight department.....	3,560 19
For gratuities and damages.....	25 00
For taxes and insurance.....	
For ferries.....	
For repairs of station building, aqueducts, fixtures, furniture.....	353 67
For interest.....	
For amount paid other companies in tolls for passengers and freight carried on their roads, specifying each company.....	
For amount paid other companies as rent for use of their roads, specifying each company.....	
For salaries of president, treasurer, superintendent, law expenses, office expenses of the above offices, and all other expenses not included in any of the foregoing items.....	541 07
	14,767 84
	21,758 43

## INCOME DURING THE YEAR.

<i>For Passengers:</i>	
1. On the main road exclusively, including branch owned by company.....	39,756 09
2. To and from other roads, specifying what.....	
<i>For Freight:</i>	
1. On main road and branches owned by company.....	16,098 31
2. To and from other connecting roads.....	
U. S. mails, express and rents.....	2,392 56
Total income.....	58,246 99
Net earnings after deducting expenses.....	36,494 56

## DIVIDENDS.

Surplus not divided.....	Road completed in Nov.
Surplus last year.....	Interest paid and due to stockholders on their assessments up to December 1st, 1846.
Total surplus.....	

## ESTIMATED DEPRECIATION BEYOND RENEWALS, VIZ:

Road and bridges.....	
Buildings.....	
Engines and cars.....	

The foregoing return is for the year 1846.  
 The amount of capital stock, as above  
 is ..... \$1,000,000 00  
 Amount paid in as above..... \$637,910  
 Amount due on old and new  
 shares..... 162,000  
 Amount of stock reserved on  
 account of funded debt.... 200,000

1,000,000 00  
 The amount of floating debt, as above,  
 is ..... 300,760 90  
 Towards the payment of which there  
 is due from stockholders, on the de-  
 mand of the treasurer..... 162,000 00  
 The amount of funded debt, as above,  
 is ..... 167,000 00

To pay which, the company holds 2000  
 shares..... 300,000 00  
 The road has been open for the entire year, only  
 to Northampton, a distance of 17 miles. On the  
 17th of August, it was opened to South Deerfield,  
 about 11 miles further; and on the 23d November  
 the entire road was in use.

The cost of running the road, including all ex-  
 penses as stated above, has not exceeded 35 per cent.  
 per mile run.

No passenger or person on the trains has received  
 any serious injury during the past year. A young  
 woman in Cabotville lost her life by stepping on the  
 road only a few feet in advance of the locomotive.  
 The train was moving slow, near the station, and  
 the usual signals were given.

Erastus Hopkins, E. H. Robbins, Samuel Hen-  
 shaw, James K. Mills.  
 January 28th, 1847.

### BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to  
 1846, INCLUSIVE, may be had Bound, at Sub-  
 scription Price, on application at this Office.

### MISSING NUMBERS OF THE RAILROAD JOURNAL.

Subscribers, who wish to obtain Missing Numbers of  
 Back Volumes of this Journal, will do well to apply  
 immediately.

One or two COMPLETE SETS of the RAILROAD  
 JOURNAL may be had in a few weeks—or as soon as two  
 numbers can be reprinted—by application to the Editor.

### RAY'S EQUALIZING RAILWAY TRUCK—THE SUBSCRIBER

York, expressly for the manufacture of the newly patented and highly ap-  
 proved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for  
 building the same, from Railroad Companies and Car Builders in the United  
 States, and elsewhere.

The above Truck has now been in use from one to two years on several  
 roads a sufficient length of time to test its durability, and other good qualities,  
 and to satisfy those who have used it, as may be seen by reference to the cer-  
 tificates which follow this notice.

There have been several improvements lately introduced upon the Truck,  
 such as additional springs in the bolster of passenger cars, making them de-  
 lightful riding cars—adapting it to tenders, trucks forward of the locomotive,  
 and freight cars, which, with its original good qualities, make it in all re-  
 spects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York  
 Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills)  
 and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

**RAILROAD IRON.—THE NEW JERSEY**  
 Iron Company, Boonton, N. J., are now pre-  
 paring to make Railroad Bars, and are ready to  
 take orders or make contracts for Rails, deliverable  
 after the first of December next. Apply to  
**FULLER & BROWN, Agent,**  
 No. 139 Greenwich, corner of Cedar street.  
 September 18, 1846. 10:30

**LAWRENCE'S ROSENDALE HYDRA-**  
 ulic Cement. This cement is warranted equal  
 to any manufactured in this country, and has been  
 pronounced superior to Francis' "Roman." Its  
 value for Aqueducts, Locks, Bridges, Floods, and  
 all Masonry exposed to dampness, is well known,  
 as it sets immediately under water, and increases in  
 solidity for years.

For sale in lots to suit purchasers, in tight paper-  
 ea barrels, by **JOHN W. LAWRENCE,**  
 142 Front street, New York.

Orders for the above will be received and  
 promptly attended to at this office. 32 1/2

**LOCOMOTIVE AND CAR AXLES.**  
 The Subscribers are now prepared to receive  
 orders for the well known and approved Reading  
 Locomotive and Car Axles—drawn to any required  
 pattern from Bloom Iron only. Address  
**SAM'L KIMBER & CO.,**  
 Willow Street Wharf,  
 Philadelphia, Pa.

**BACK VOLUMES OF THE RAILROAD**  
**JOURNAL** for sale at the office, No. 105  
 Chestnut street.

**A. & G. HALSTON & CO., NO. 4**  
 South Front St., Philadelphia, Pa.  
 Have now on hand, for sale, Railroad Iron, viz:  
 180 tons 2 1/2 x 4 inch Flat Punched Rails, 20 ft. long.  
 25 " 2 1/2 x 1 " Flange Iron Rails.  
 75 " 1 x 1 " Flat Punched Bars for Drafts  
 in Mines. A full assortment of Railroad Spikes,  
 Boat and Ship Spikes. They are prepared to exe-  
 cute orders for every description of Railroad Iron  
 and Fixtures. 11/

### ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—

For sale or imported to order by the subscriber.  
 These Ropes are manufactured on an entirely different principle from any other, and are now al-  
 most exclusively used in the collieries and on the railways in Great Britain, where they are considered  
 to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The  
 plan upon which they are made effectually secures them from corrosion in the interior, as well as the  
 exterior of the rope, and gives a greater compactness and elasticity than is found in any other manu-  
 facture.

Many of these ropes have been in constant operation in the different mines in England, and on the  
 Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines,  
 heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc.  
 Reference is made to the annexed statement for the relative strength and size. Testimonials from the  
 most eminent engineers in England can be shown as to their efficiency, and any additional information  
 required respecting the different descriptions and application will be given by

**ALFRED L. KEMP,**  
 75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with  
 Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.	Weight per fathom.	Weight per fathom.	Diameter of iron.	
	INCH.	LBS. OZ.	INCH.	LBS. OZ.	LBS.	LBS.	INCH.	Tons.
11	4 1/2	13 5	10	21 -	50	15-16	90

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so  
 that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1724

river, (of which firm the subscriber was late a partner) under the immediat  
 supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently  
 been turned out for the New York and Erie railroad, and the New Jersey  
 Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully  
 solicited.

New York, May 4, 1846. **W. H. CALKINS, and Others.**  
 To all whom it may concern:—This is to certify that the New Haven,  
 Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's  
 patent trucks for the last 20 months, during which time it appears to me, they  
 have proved to be the best and most economical truck now in use.

[Signed,] **WILLIAM ROE, Supt of Power.**  
 I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in  
 use on the Philadelphia and Reading railroad for some time past, under a  
 passenger car.

For simplicity of construction, economy in cost, lightness of material, and  
 extreme ease of motion, I consider it the best truck we have ever used. Its  
 peculiar make also renders it less liable to be thrown off the track, when pas-  
 senger over any obstruction. We intend using it extensively under the passen-  
 ger and freight cars of the above road.

Reading, Pa., October 6, 1845. [Signed,] **G. A. NICOLL,**  
 Supt. Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Rail-  
 road and Transportation company have used Fowler M. Ray's Truck for the  
 last seven months, during which time it has operated to our entire satisfaction.  
 I have no hesitation in saying that it is the simplest and most economical  
 truck now in use. [Signed,] **T. L. SMITH,**

Jersey City, November 4, 1845. **N. Jersey Railroad and Transp. Co.**  
 This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has  
 been in use on the Long Island railroad for the last year, under a freight car.  
 For simplicity of construction, economy in cost, lightness of material and  
 ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot, [Signed,] **JOHN LEACH,**  
 Jamaica November 12, 1846. } 1y19 Supt Motive Power.

**RICH & CO'S IMPROVED PATENT SALAMANDER SAFES.**

Warranted free from dampness, as well as fire and thief proof.

Particular attention is invited to the following certificates, which speak for themselves:

**TEST No. 10.**

*Certificate from Mr. Silas C. Field, of Vicksburg, Mississippi.*

On the morning of the 14th ult., the store owned and occupied by me in this city, was, with its contents, entirely consumed by fire. My stock of goods consisted of oil, rosin, lard, pork, sugar, molasses, ignors, and other articles of a combustible nature, in the midst of which was one of Rich's Improved Patent Salamander Safes, which I purchased last October of Mr. Isaac Bridge, New Orleans, and which contained my books and papers. This safe was red hot, and did not cool sufficiently to be opened until 16 hours after it was taken from the ruins. At the expiration of that time it was unlocked, when its contents proved to be entirely uninjured, and not even discolored. I deem this test sufficient to show that the high reputation enjoyed by Rich's Safes is well merited.

S. C. FIELD.

**TEST No. 11.—Certificate.**

By the fire which occurred in this village on the 27th July last, our Law Office, together with many other buildings, was destroyed—we had in our office one of Rich's Improved Patent Salamander Safes, which, though heated red hot, preserved, without being the least damaged, many papers valuable to our clients—the envelopes of a few papers being slightly scorched. Some twenty-four hours after the fire, the Safe was removed, and so hot was it, that several hours were required for it to cool off. Our office was in the second story of a large brick building, all the wood used in construction of said house being pitch pine. While the Safe was red hot, one of the walls tumbled in, and so injured the lock that it was necessary to break the door open. From this test, we feel no hesitancy in recommending "Rich's Patent Salamander Safe" as entirely fire proof.

GORE & KING.

Marion, Ala., Sept. 15th, 1846.

*Still other Tests in the Great Fire of July 19, 1845.*

The undersigned purchased of A. S. Martin, No. 138½ Water street, one of Rich's Improved Patent Salamander Safes, which was in our store, No. 54 Exchange place. The store was entirely consumed in the great conflagration on the morning of the 19th inst. The safe was taken from the ruins 52 hours after, and on opening it, the books and papers were found entirely uninjured by fire, and only slightly wet—the leather on some of the books was perched by the extreme heat.

RICHARDS & CROOKHITT.

Benton, Miss., December 27, 1845.

One of Rich's Improved Salamander Safes, which I purchased on the 3d of June last of A. S. Martin, 138½ Water street, agent for the manufacturer, was exposed to the most intense heat during the late dreadful conflagration. The store which I occupied, No. 46 Broad street, was entirely consumed; the safe fell from the 2d story, about 15 feet, into the cellar, and remained there 14 hours, and when found, I am told, and from its appearance afterwards, should judge that it had been heated to a red heat. On opening it, the books and papers were found not to have been touched by fire. I deem this ordeal sufficient to confirm fully the reputation that Rich's safe has already obtained for preserving its contents against all hazards.

(Signed,)

WM. BLOODGOOD.

New York, 21st July, 1845.

Reference made to upwards of nine hundred and fifty merchants, cashiers, brokers, and officers of courts and counties, who have Rich's Safe's in use.

The above safes are finished in the neatest manner, and can be made to order at short notice, of any size and pattern, and fitted to contain plate, jewelry, etc. Prices from \$50 to \$500 each. For sale by

A. S. MARVIN, General Agent,  
138½ Water st., N. Y.

Also by Isaac Bridge 76 Magazine street, New Orleans.

Also by Lewis M Hatch, 120 Meeting street Charleston, S. C.

16 U

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

TO THOSE INTERESTED IN Railroads, Railroad Directors and Managers are respectfully invited to examine an improved SPARK ARRESTER, recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger and freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Supt Hartford and New Haven Railroad; W. R. M'Kee, Supt Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Supt New Jersey Railroad Trans. Co.; J. Elliott, Supt Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Supt Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Supt Macon Railroad, Macon, Ga.; J. H. Cleveland, Supt Southern Railroad, Monroe, Mich.; M. F. Chittenden, Supt M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckley & Drury, Boston, will be promptly executed.

FRENCH & BAIRD.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

••• The letters in the figures refer to the article given in the Journal of June, 1844.

**PATENT HAMMERED RAILROAD, SHIP and Boat Spikes.** The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 3 to 13 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed.

JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y. The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merriam, New York; J. H. Whitney, do.; E. J. Etting, Philadelphia; Wm. E. Coffin & Co., Boston.

ja45

**MACHINE WORKS OF ROGERS, Ketchum & Grosvenor, Patterson, N. J.** The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR,  
a45 Paterson, N. J., or 60 Wall street, N. York.

**PATENT RAILROAD, SHIP AND BOAT Spikes.** The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by L. & J. Townsend, Albany, and the principal iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

••• Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

ja45

**SPRING STEEL FOR LOCOMOTIVES, Tenders and Cars.** The Subscriber is engaged in manufacturing Spring Steel from 1½ to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,

## DAVENPORT & BRIDGES'

### CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

### THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis is 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.	
4,324 Timbers, 11 ft. long, 3 x 6 inches =	68,896 ft. b.m., at \$10 = \$688 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	4,403 ft. b.m., at \$13 = 57 24
13,000 Spikes = 2,350 lbs. at 4½ cts. =	101 25
Workmanship free of patent charge =	600 00

Cost of one mile including the laying of the Rail = \$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

**JAMES HERRON.**

Civil Engineer and Patentee.

No. 277 South Tenth St., Philadelphia. 336

### FRANKLIN HOUSE,

No. 103 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the Franklin House, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,  
105 Chestnut Street,  
PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS.—Five Dollars a year, in advance.

**BOSTON AND PROVIDENCE RAILROAD.** Passenger Notice. Summer Arrangement. On and after Monday, Sept. 28, 1846, the Passenger Trains will run as follows:

For New York—Night Line, via Stonington. Leaves Boston every day, but Sunday, at 5 p.m. Accommodation Trains, leave Boston at 7 1/2 a.m. and 3 1/2 p.m., and Providence at 8 a.m. and 3 1/2 p.m. Dedham trains, leave Boston at 9 a.m., 3 p.m., 6 1/2 p.m., and 10 1/2 p.m. Leave Dedham at 8 a.m. and 4 1/2 and 9 p.m. Stoughton trains, leave Boston at 11 1/2 a.m. and 4-10 p.m. Leave Stoughton at 8 a.m. and 2 1/2 p.m. All baggage at the risk of the owners thereof.

31 ly W. RAYMOND LEE, Sup't.

**BRANCH RAILROAD and STAGES CONNECTING WITH THE BOSTON AND PROVIDENCE RAILROAD.**

Stages connect with the Accommodation trains at the Foxboro' Station, to and from Woonsocket. At the Pawtucket Station, to and from Lonsdale, R. I. via Pawtucket. At the Sharon Station, to and from Walpole, Mass. And at Dedham Village Station, to and from Medford, via Medway, Mass. At Providence, to and from Bristol, via Warren, R. I.—Taunton; New Bedford and Fall River cars run in connection with the accommodation trains.

## PHILADELPHIA AND READING RAILROAD.—Passenger Train Arrangement for 1847.

A Passenger Train will leave Philadelphia and Pottsville daily, except Sundays at 9 o'clock A. M. The Train from Philadelphia arrives at Reading at 12 18 M. The Train from Pottsville arrives at Reading at 10 43 A. M.

Fares.	Miles.	No. 1.	No. 2.
Between Phila. and Pottsville, 92		\$3 50 and \$3 00	
" " Reading, 58		2 25 and 1 90	
" " Pottsville, 34		1 40 and 1 20	

Five minutes allowed at Reading; and three at other way stations. Passenger Depot in Philadelphia corner of Broad and Vine streets.

## LEXINGTON AND OHIO RAILROAD.

Trains leave Lexington for Frankfort daily, at 5 o'clock a.m., and 2 p.m. Trains leave Frankfort for Lexington daily, at 8 o'clock a.m. and 2 p.m. Distance, 28 miles. Fare \$1 25.

On Sunday but one train, 5 o'clock a.m. from Lexington, and 2 o'clock p.m. from Frankfort. The winter arrangement (after 15th September to 15th March) is 6 o'clock a.m. from Lexington, and 9 a.m. from Frankfort, other hours as above.

## BOSTON AND MAINE RAILROAD.

Upper Route, to Portland and the East. SUMMER ARRANGEMENT, April 1, 1847.

**PORTLAND TRAINS.** Leave Boston at 7 A.M. and 2 1/2 P.M. Leave Portland at 7 1/2 A.M. and 3 P.M.

**GREAT FALLS TRAIN.** Leave Boston at 5 P.M. Leave Great Falls at 6 1/2 A.M.

**HAVERHILL TRAINS.** Leave Boston at 11 1/2 A.M. and 6-20 P.M. Leave Haverhill at 6 1/2 A.M. and 4 1/2 P.M.

**READING TRAINS.** Leave Boston at 8 1/2 A.M. and 8 1/2 P.M. Leave Reading at 6 A.M. and 1 1/2 P.M.

**MEDFORD BRANCH TRAINS.** Leave Boston at 7 1/2, 11 1/2 A.M., 2 1/2, 5 1/2, 7 P.M. Leave Medford at 6 1/2, 8 A.M., 1 1/2, 4 1/2, 6 P.M.

The Depot in Boston is on Haymarket Square. Passengers are not allowed to carry Baggage above \$50 in value, and that personal, unless notice is given, and an extra amount paid, at the rate of the price of a Ticket for every \$500 additional value.

1 ly 31 CHAS. MINOT, Sup't.

## SUMMER ARRANGEMENT.—NEW YORK AND ERIE RAILROAD LINE, from April

1st until further notice, will run daily (Sundays excepted) between the city of New York and Middletown, Goshen, and intermediate places, as follows:

### FOR PASSENGERS—

Leave New York at 7 A.M. and 4 P.M. " Middletown at 6 1/2 A.M. and 5 1/2 P.M.

FARE REDUCED TO \$1 25 to Middletown—way in proportion. Breakfast, supper and berths can be had on the steamboat.

### FOR FREIGHT—

Leave New York at 5 P.M. " Middletown at 12 M.

The names of the consignee and of the station where to be left, must be distinctly marked upon each article shipped. Freight not received after 5 P.M. in New York.

Apply to J. F. Clarkson, agent, at office corner of Duane and West sts. H. C. SEYMOUR, Sup't, March 25th, 1846.

Stages run daily from Middletown, on the arrival of the afternoon train, to Milford, Carbondale, Honesdale, Montrose, Towanda, Owego, and West; also to Monticello, Windsor, Binghamton, Ithaca, etc., etc. Agent on board.

## NORWICH AND WORCESTER RAILROAD.

Summer Arrangement. Change of Hours. Commencing on Wednesday, April 21, 1847.

Accommodation Trains, daily, (except Sunday.) Leave Norwich, at 6 a.m., and 4 1/2 p.m. Leave Worcester, at 8 1/2 a.m., and 4 1/2 p.m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston, and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 2 1/2 p.m. train from Boston.

New York Train via Steamboat—Leave Norwich for Boston, every morning, except Monday, on the arrival of the steamboat from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 6 1/2 p.m., daily, except Sunday, stopping at Danielsonville and Norwich.

Freight Trains daily each way, except Sunday.—Leave Norwich at 7, and Worcester at 6 30 a.m. Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are less when paid for Tickets than when paid in the Cars. J. W. STOWELL, Sup't

# NORRIS' LOCOMOTIVE WORKS.

BUSH HILL, PHILADELPHIA, Pennsylvania.

**MANUFACTURE** their Patent 6 Wheel Combined and 8 Wheel Locomotives of the following descriptions, viz:

Class 1,	15 inches	Diameter of	Cylinder,	× 20 inches	Stroke.
" 2,	14	"	"	× 24	"
" 3,	14½	"	"	× 20	"

**THE NEWCASTLE MANUFACTURING** Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention. **ANDREW C. GRAY**, a45 President of the Newcastle Manuf. Co.

**RAILROAD IRON AND LOCOMOTIVE** Tyres imported to order and constantly on hand by **A. & G. RALSTON** Mar. 20th 4 South Front St., Philadelphia. 28th

**VALUABLE PROPERTY ON THE MILL Dam For Sale.** A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 68,497 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, lace, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x39 ft, with lathes, work benches, Work shop, 86x36 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, turnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45 feet two stories high, with a shed part 45x20 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 200 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to **HENRY ANDREWS**, 48 State st., or to **CURTIS, LEAVENS & CO.**, 106 State st., Boston, or to **A. & G. RALSTON & Co.**, Philadelphia. 1a45

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

**PASCAL IRON WORKS.**

**WELDED WROUGHT-IRON TUBES**

From 4 inches to 1 in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T, L, and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FIRES.

Manufactured and for sale by

**MORRIS, TASKER & MORRIS.**

Warehouse S. E. Corner of Third & Walnut Streets,

**PHILADELPHIA.**

**TO LOCOMOTIVE AND MARINE ENGINE Boiler Builders.** Pascal Iron Works, Philadelphia. Welded Wrought Iron Pipes, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

**MORRIS TASKER & MORRIS,**

Warehouse S. E. corner 3d and Walnut Sts., Philadelphia. 11f

**PATENT INDESTRUCTIBLE WATER**

Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits. This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 113 Fulton street, New York.

**J. BALL & CO.**

## SWAMPY LAND RECLAIMING LAND IN HOLLAND.

The following is from the London Mining Journal for February 20th:

The paper read was a continuation of that which was brought forward at the last meeting by Mr. G. E. W. Jackson, Assoc. Inst. C. E. He gave an "account of the mode of gaining land from the sea by polders, and the art of building with fascine work as practised in Holland and Germany."

The paper commenced by reference to the works of Mela, Weibeking, Spanzia, Caland, Hyde Clarke, and others, as having given the best known accounts of Dutch water constructions and the situations of these labors. It then described the "polders" as being tracts of land recovered from the sea by the construction of a belt of dykes, gradually raised to above the water level, and then pumped dry, by which means they were still rendered habitable, the level of many of the more ancient being beneath that of the sea. When thus reclaimed, they form the finest sand, and produce for many years immense crops, almost without the application of manure. The usual construction of these dykes was described to be by sinking successive layers or beds of fascines or faggots of almost 30 in. thick, by from 8 to 16 yards in width, and of proportionate length, weighted with gravel and stones, mingled with clay, seaweed, and silt. These layers were continued until they reached above the sea level, when the top was constructed of more solid materials, and sometimes capped with a flooring of brick work, as the public roads were formed upon them. The difficulties of the usual construction of the larger and of the smaller dykes of various forms and heights were fully described, particularly entering into the details of the dimensions and quantities of the materials employed, and the precautions to be taken for the delicate operation of closing the last portion of each dyke, which, unless skillfully conducted in proper weather, frequently hazards the safety of the whole work.

The different kinds of lock gates and sluices used for facilitating the outflow of the land waters, and preventing the ingress of the sea, were fully described, and drew from several members accounts of balance and other gates of peculiar construction used in Holland and elsewhere. The original kind appear to have been the self-acting balance gates of unequal surface, so placed upon pivots, that on the rising of the tide, they closed, and remained so, until, on the receding of the tide, the weight of the accumulated land waters forced them open. Recently, machinery has been employed for opening and shutting these gates, and the ordinary lock gates have generally been adopted, and it was found that they were frequently prevented from shutting by some floating matter getting between the mill-locks, and great leakage ensued. The general details were then given of the method adopted for the subsequent drainage of the polder lands, the separation of the springs, the upland and lowland waters, and the methods of conducting them out to sea. The slopes of the faces of the dykes vary considerably. Some of the low dykes are in section

of the form of an arc of a circle of 6 to 10 ft. cord, 10 in. to 1 ft. versed sine, covered with fascine matting staked down upon a clay bed. Others have a base of 19 ft. wide and 5 feet high, of a triangular section, also made of fascines and stakes, secured by hurdles and wattling, with clay, peat, sea shells, and sand, well rammed in, and then covered with turf. Others are formed of rows of piles 16 ft. long, with their heads 6 or 7 ft. above the shore, joined longitudinally and laterally by wailing timber, filled in and around with fascine beds, and weighted with stone. Baskets filled with sand are also used in certain situations, as well as various modifications of all these kinds of protections. It was stated that these constructions were found to succeed better, and last as long as stone, being at the same time about half the cost; and in the discussion which ensued, this statement was confirmed even for some parts of England, where stone was not expensive.

Our limits will not permit a more extended notice of this excellent paper, of which it was justly said by one of the speakers that "it is the first detailed account in the English language of some of the most interesting hydraulic works of Holland."

## The "Air Line" Again.

The Boston Times, after the last severe storm, appropriates a column to the subject of a railroad from New York to Boston, and amongst other arguments, pressing the matter upon the consideration of its readers, the editor remarks:

"We have now been without a mail from New York and the South for two days in succession, a misfortune by which publishers, merchants, and all interested in the regular transmission of intelligence, are put to serious inconvenience and loss. This is not a solitary instance of disappointment and embarrassment. The same derangement of business has occurred frequently during the past winter and present spring; in fact, we do not recollect a season in which the mail failures have been so frequent; and the active state of business and the interesting position of our national affairs have rendered these interruptions to the regular transmission of commercial data and news peculiarly unfortunate now. The worst of it is, there is no fit fault to find with any individual; and had there been, it would have been a great relief to the overcharged feelings of a disappointed editor to launch some of his *brutum fulmen* at the head of the offender. But the elements have conspired against us, and made a Russian campaign of it.

This fact strongly establishes the imperious necessity of forming some line of communication, between New York and Boston, which shall be independent of the weather at all times; a route over which the mail and passengers may be despatched with safety and speed, blow high or blow low. The "Air Line" so called, from Boston to New York, a petition for the charter of which is now before our legislature, seems imperatively demanded by the wants of the public, and would undoubtedly supply all the deficiencies of which they have had so frequent and just cause to complain. The advantages of this

route are so obvious that the strenuous opposition made to it by interested individuals and corporations justly incurs the censure due to selfishness and illiberality. It would ill become the legislature of Massachusetts, after granting so many railroad charters as they have, to discountenance so grand and praiseworthy a scheme, a plan in which the mass of the community are favorably interested, because it happens to conflict with the money-making schemes of certain individuals. We look for a more liberal spirit of legislation from the Old Bay State and are convinced that it will prevail.

## RAILWAY SHAREHOLDER'S MANUAL.

We find, in the Railway Chronicle, the following notice and extract from a work of which we have heard much—and which we should like well to see.

The extract alluded to we give at length, as it shows so conclusively what has been accomplished by the introduction of railroads.

"The Railway Shareholder's Manual. By Henry Tuck. Eighth Edition.

"Eight editions of a book in less than two years is a sufficient evidence of its merits and usefulness. Mr. Tuck's Manual keeps pace with the increase of railway affairs; and after a careful examination of this present edition, we are happy to say that, considering its compass, it leaves us nothing to desire. We find in the preface some remarks which are worthy of repetition:

"But if railways are monopolies, what is to be said of canals? and yet at no time has there been a word uttered against these undertakings. The present inland navigation in Great Britain by means of canals, is estimated to be about 2,500 miles. Up to the introduction of the railway system, it afforded almost the exclusive means of conveyance of heavy goods and merchandise, from one part of the country to another, and especially from the principal manufacturing districts to the outports. Many of these undertakings have yielded an enormous return on the capital expended, and at the present time the Grand Junction canal pays a dividend of 7 per cent., the Melton canal 12 per cent., and the Oxford canal a dividend of 26 per cent., and neither the Times nor 'Cato' have held this to be a monopoly, or an inordinate profit. Notwithstanding, such is the advantage of the railway system, that the goods traffic is progressively being transferred to the railways, in every part of the kingdom."

"The effect of railways on canal charges are thus stated:

"The distance between Manchester and Hull is 99 miles; before the railway was opened, the chief traffic was carried on by canals. The freight for corn and flour was 24s. per ton, cotton twist 32s. 6d. per ton, and manufactured goods 45s. per ton. The Manchester and Leeds railway now carry corn and flour for 13s. per ton, cotton twist for 30s. per ton, and manufactured goods for 24s. per ton. On the Trent and Mersey canal, the freight for coal was 1s. 2d. per ton per mile; it is now reduced to one-half penny per ton per mile. The following tables of reduced tonnages in the Midland district are equally interesting:

*Statement of reduced tonnages on canals, showing the advantage which the public have derived by competition between railways and canals.*

Tonnage on the undermentioned lines of canal.	Rate which they were entitled, under their acts to charge, and which they did charge.	Reduced since 1836 to

"Here is sufficient proof of the vast superiority of railways over canals in merchandize traffic, without adverting to the advantages possessed by railways for the conveyance of cattle, live stock, fish, fruit, milk, vegetables, and other perishable commodities; but when we take into consideration the immense passenger traffic, that has been called into existence since the introduction of railways, it is obvious that nothing but the most absurd prejudice, the most stupid obstinacy, or the most corrupt venality, can be opposed to the railway system."

#### Foreign Items.

**Improvements in Locomotives.**—Several experimental trips with the first of a class of narrow gauge engines, the patents of which propose by them to secure greater safety and greater speed on the narrow gauge, have been made upon the London and North Western railway during the last three or four days. The locomotive in question is one of Mr. Crampton's in whose practical knowledge much reliance has been placed by the narrow gauge party for the production of a locomotive that shall possess both of the excellencies we have mentioned—viz, increased speed and power, and increased safety. The latter, as we shall show, appears to have been secured by the engine, the working of which we are about to notice. With respect to the speed the evidence is not of so positive a character; but it would be exceedingly unfair to draw any inference on this point from the details given below, and for the very plain

and simple reasons that are appended thereto. The engine alluded to is called the *Namur*, and has been made by Mr. Crampton for the Namur and Liege company. It is a six wheeled engine, with 7 ft. driving wheels.—One of the greatest hindrances which have heretofore presented themselves to the attainment of high speed upon the narrow gauge has been what is called the back pressure in the cylinder. This pressure is in proportion to the diameter of the blast pipe by which heated air is drawn through the tubes of the boiler, and the number of revolutions made by the driving wheels. To remedy this, Mr. R. Stephenson increased the diameter of the driving wheels of his outside cylinder and long-boiler engines to 6 ft.; then to 6 ft. 6 or 7 in.; and on Tuesday we saw, at Wolverton, a locomotive made by that eminent engineer and manufacturer with driving wheels 7 ft. in diameter. But we may very fairly doubt whether Mr. Stephenson, in thus increasing the diameter of his driving wheels to 7 ft., has not aimed at speed at the expense of safety. Without pretending to accuracy, we may venture to assert, that the 7 ft. driving wheel engine we saw on Tuesday had a height of nearly 9 ft. between the rail and the top of the boiler. Upon a road in perfect order, such a height of boiler might not be very objectionable at 60 miles an hour—that is, supposing this class of engine to possess sufficient power to run at that rate with moderate heavy trains; but we think there are few locomotive superintendents who would be perfectly at ease when riding upon such an engine at such a rate over the best laid and most vigilantly watched narrow gauge line in the kingdom. To obviate this difficulty of back pressure, Mr. Crampton has carried the axle of his driving wheel behind his fire-box; and as he uses outside cylinders, he can increase the diameter of those wheels without raising the height of the centre of gravity. For instance, while Mr. Stephenson's 7 ft. driving wheel engine has the top of the boiler 8 ft. 9 in. from the rail, Mr. Crampton's engine, with a similar driving wheel, has the top of the boiler about 6 ft. 9 in. only from the rail—that is, the centre of gravity in the one is 2 ft. lower than it is in the other. In this respect Mr. Crampton, we repeat, appears to have succeeded; for his engine, at the greatest speed attained by it on Tuesday, was remarkably steady—as steady as any engine we have ever noticed on the broad gauge. It would seem, therefore, unless it be contended that an engine with the driving wheel behind is less safe than an engine with the driving in the centre, that Mr. Crampton has attained one of his objects—viz, a large driving wheel with perfect steadiness, and a low centre of gravity. Mr. Crampton also seeks to effect as large an available reduction of back pressure as possible, by diminishing the thickness of the layer of coke in his fire box, and increasing the area of the fire bars. His theory is, that by thus lessening the thickness of the layer of coke, he is enabled to do with less draught, and can consequently increase the diameter of the blast pipe to its maximum size.

With these explanatory observations, we shall proceed to notice the working of the *Namur*. The engine was attached to the 12 o'clock train from Euston square. The train consisted of 9 carriages, weighing nearly 50 tons. Between Euston square and the 11th mile post, the speed was, upon a rising gradient of 1 in 350, 40 miles per hour. Between this station and Boxmoor, the next place at which the train stopped, the axle of the tender became very hot, and the speed of the engine was reduced; the rate, however, reached was 52 miles per hour, on a gradient of 1 in 1056. The train, notwithstanding that the steam had been partly shot off, arrived at Boxmoor 6 min. 30 sec. before its time. Here the axles were found to be still hot, and the driver was instructed not to run the engine at full speed. The speed was consequently below the capacity of the engine; but at her reduced power she made the Leighton station 10 min. 46 sec. before her time—that is, she made this time between Boxmoor and Leighton—because although the train reached the former station 64 min. too soon, it did not leave the place till the moment marked down for the guidance of the station master. With axles still hot, the train left Leighton at the correct time, and arrived at Wolverton 8 min. before time, having reached a maximum speed of nearly 57 miles per hour. The steam was blowing off nearly the whole of the journey.

The *Namur* is stated to be 40 per cent less in power than a large class of engine now in the course of construction for the London and North Western company, under Mr. Crampton's superintendence. This engine, will, we believe, have 5 per cent more power than the best engines at present on the narrow gauge lines—in safety, we should imagine it will be superior beyond all comparison. We have now to ascertain what the *Namur* will do when it gets into good working order, and has no drawbacks of hot axles, and the circumstances attendant upon the working out a new arrangement like Mr. Crampton's. The first trip taken by the above engine was on Saturday last. On that occasion she was attached to a special train to Tring, in order to enable the directors of the Namur and Liege company to form an opinion of her working. Among those who went down were Mr. A. Spottiswoode, the chairman of the company; Mr. J. Gurney, the deputy chairman; Mr. A. Grey and Mr. F. Reynolds, two of the directors; the secretary, Mr. Cary; the engineer, Mr. G. Rennie, the patentee, Mr. Crampton; and the manufacturer, Mr. Tulk.

We look with anxiety for the working of Mr. Crampton's engine, when it shall have got into thorough running order.

**Atmospheric Railway.**—The atmospheric principle was tried yesterday for the first time. The piston carriage started from the Exeter station a little after 6 last evening. There were present Messrs. Samuda and Atkinson, the Atmospheric engineers, Mr. Magary, the resident engineer, Mr. Clark, the superintendent of the line, Mr. Marshall, the contractors' agent, Dr. Miller, Mr. Ralph Sanders, etc. The piston carriage was attended by a loco-

motive, which propelled to the pipe at starting. An exhaustion of 17 inches was readily obtained, 14 being a working pressure.—Every thing was found to answer exceedingly well. The carriage stopped at the St. Thomas's station with great precision. It was perfectly under command, and the oscillation was comparatively nothing to that of the locomotive. The experiment was very cautiously effected, in consequence of the pipes never having yet been thoroughly gone thro'. But it fully answered the expectations of all concerned, and must have been very gratifying to the patentee, Mr. Samuda, and to Mr. Atkinson, who has had the chief management of the preparations. The inventor, Mr. Clegg, was not present, we believe. He ought not to be forgotten in the triumph of a principle which has cost him years of labor and anxiety, though younger and more influential hands have taken the burthen and the glory of its full achievement.—*Western Times.*

**India Rubber Buffer Springs.**—An application of what is termed "Vulcanized India rubber" to the springs of buffers of railway carriages has been patented by Messrs. Fuller and De Bergue, and is in use in some of the carriages of the Great Western railway and on the Eastern Counties railway. The invention appears to be important, and it is stated to have been examined and approved of by Messrs. R. Stephenson, W. Cubit, Brunel, and other competent judges. The buffer springs of Messrs. Fuller combine simplicity with security; and the inventors contend that they are superior to the steel springs usually employed in buffers, because they are at their commencement more elastic and more easily acted upon; the power of their resistance, after yielding to a certain extent, increases in such a ratio as to prevent the possibility of the buffer head being brought to a dead hard stop, and consequently in cases of collision results less dangerous than those which generally ensue can be anticipated. Their lightness, and the facility with which their power may be regulated, are also important advantages. It is difficult, without an experienced judgment, and the practical knowledge of engineering, to give an opinion on such an invention as this that shall be either valuable or influential, but it may be of benefit to the public to call their attention to it.

**Tires "without welding," for Locomotives.**—The following suggestions, elicited by the opinions expressed by Messrs. Gooch and Braithwaite, at the inquest as to the cause of the late fatal accident on the Great Western, deserve attention:—"I have for several years given considerable attention to the subject of the manufacture of iron for locomotive carriages and other purposes; and I am convinced, from partial experience, that tires for locomotive carriages should be composed of one entire circle without welding. These tires should be constructed from scrap iron, which, after reworking, forms a material superior in texture and strength to the quality of iron now used, while the cost of manufacture would not exceed the present method.—As I am in possession of the plan by which such an improved mode of tire can be con-

structed, I shall feel obliged if you will give these imperfect remarks a place in your valuable columns, as I am thoroughly satisfied that if the suggestion to which I have alluded be generally adopted in the manufacture of wheels for locomotive carriages, similar accidents to that which lately occurred on the Great Western may be prevented, and thus a great loss of human life be spared.—Geo. Soott, Engineer; *Bouverie street, Feb. 16.*" We are informed also, that Mr. W. Exall, of Katesgrove iron works, Reading, has turned his attention to this subject, and succeeded so satisfactorily, as to be induced to secure his invention by a patent, which he anticipates the recent accidents will bring into general use. We shall readily afford both parties space for a description of their relative plans.

**Smelting Copper.**—Mr. T. Bell, of the Don Alkali Works, South Shields, has recently patented an improved process for obtaining sulphuric acid from the ores of copper during the roasting of the ore. For this purpose the ore in powder is placed on the shelves or a common roasting furnace, such as is in general use in the smelting of copper ores. To this furnace a roasting kiln is attached by a flue, which enters 2 ft. from the bottom, and is from 150 ft. to 200 ft. in length; in the kiln copper ore is also put, but in lumps near the end of the flue there is a jet of steam, which, adding to the draught of furnace, coke, anthracite coal, or charcoal, may be used instead of bituminous coal. The top of the kiln is arched over, and a flue passes through the top into a vitriol chamber. Near that end of the flue which enters the vitriol chamber, the steam jet passes into the centre of the flue. During the roasting of the ore sulphurous acid is formed, which, in passing through the flues is mixed with the aqueous vapor, and partly becomes condensed into sulphuric acid; in this state it passes into the vitriol chamber, and collects on the floor; at the same time, the uncondensed sulphurous acid gas and steam, on passing into the vitriol chamber, meet with the nitrous acid gas, produced by acting on saltpetre, or nitrate of soda, by strong sulphuric acid. But still, much of the sulphuric acid escapes condensation; this is afterwards condensed in columns of coke, previously exhausted as described in a former patent (dated November 3, 1845, for improvements in the manufacture of sulphuric acid), or by means of a high chimney. The claims are for the use of coke or charcoal in obtaining sulphuric acid from copper ores, in the manner above described; and also for using the columns of coke in combination with exhaustion, in the manner above described.

**Experiments on the Atmospheric Railway System in France.**—A few days ago experiments were made on the Paris and St. Germain Atmospheric line, between the stations at the wood of Vesinet, and the park at the chateau, in the presence of several members of the legislature, engineers, and others interested in the atmospheric system. A train containing the visitors, left the Paris station, Rue St. Lazare, at a quarter past 11 o'clock,

and arrived at Vesinet at 40 minutes past. The signal to set in motion the stationary engine at St. Germain was sent by the electric telegraph, laid down under the direction of M. Breguet. A vacuum of 32 centimetres were then effected in 2 minutes 30 sec.; and a train composed of five carriages, besides that containing the piston, started off with speed. The ascent to St. Germain was accomplished in four minutes, the average speed being therefore 33 kilometres per hour. The vacuum increased during that time from 32 to 43 centimetres. Five other trains successively ran at intervals of three-quarters of an hour, the number of carriages being increased every time until it reached 11, exclusive of the piston carriage. Every time the results grew more and more favorable. The last train, the heaviest of all, and the weight of which was 54 tons, performed the ascent in no more than four minutes, under the influence of a vacuum varying from 32 to 65 centimetres. The vacuum of 32 centimetres was always obtained in two minutes and a half, with but one machine. The four pneumatic cylinders were worked for only two minutes, and that solely when the train began to ascend the gradients of 32 and 35 millimetres, which terminate the line; trains of 9 or 10 carriages ascended in three minutes and a half, under the influence of a vacuum varying between 35 and 50, and even 65 centimetres. This last degree has never been surpassed in England. The next experiments will take place before the commission appointed by the Minister of Public Works, to present a report on the atmospheric system.

**Causes of Railway Accidents.**—The following letter, from our esteemed correspondent, "Nauticus," appeared in the Times of Thursday: "In your account of the fatal accident on the Great Western, it is evident that the direct cause of this accident was the insufficient manner in which the tire of the driving wheel was secured 'to the ring of it,' the only security being that of the tenacious gripe acquired by the iron in cooling, caused by the contraction of the metal, it being 'chilled' on to the ring of the wheel, 'just as in the construction of an ordinary wooden wheel.' It appears that Mr. Gooch has a patent for this mode of constructing the tire of railway carriage wheels. Now, I think you will agree with me, that Mr. Gooch in proposing, and Mr. Brunel in giving his sanction to, this mode of securing the tires to the wheels of railway carriages, have, to use the mildest term, acted indiscreetly, and without giving the matter proper consideration; because the only security given to the tire to retain its position firmly on the 'ring of the wheel,' is obtained, as I have just stated, by its contraction in cooling; and when the wheel is rapidly progressing along the rail, great heat is generated by the friction between them; therefore the tire again expands, and, consequently, the firmness of the grip with which it embraces the ring of the wheel is relaxed, the too certain result being that, on any oscillation occurring to create a lateral thrust on to the flange, the position of the tire on the ring of the wheel is changed, and the fric-

Correspondents will oblige us by sending in their communications by Tuesday morning at latest.

AMERICAN RAILROAD JOURNAL.

Published by D. E. MINOR, 105 Chestnut St., Philadelphia.

Saturday, April 24, 1847.

Massachusetts Annual Reports.

We give, this week, another of the Massachusetts Annual Reports.

Table of Railroads—Corrections.

MONTGOMERY, ALA., April 3, 1847.

Sir—In your late list of railroads, you have given our road a bar  $\frac{1}{2}$  by 2 inches—it should be  $\frac{1}{2}$  by 2. Our maximum grade is 52 feet—only one grade of that acclivity—the general maximum is 42 feet. On the extension, beyond Moore's, we shall use a modification of the flat bar, having  $\frac{1}{2}$  inch thickness, and weighing 40 tons to the mile. We expect to open the road for use to Auburn in July. The length will then be 60 miles.

Respectfully yours,

L. P. GRANT,

Engineer and Sup. M. and W. P. R. R.

Will others do likewise? This is the way to make the table correct, and the only way for us to get at the present state of many of the roads.

Portland, April 14, 1847.

To the Editor of the R. R. Journal:

Dear Sir—I take the liberty to send you the following items for your Table of Railroads, as corrections:

Atlantic and St. Lawrence Railroad.—Track 5 feet 6 inches wide (i.e. gauge.) Kind of rail  $\frac{1}{2}$  (i.e. bridge rail). Weight of rail, 63 lbs. to the lineal yard. Highest grade per mile, 45 feet.

Your table is a most valuable document. I have posted it up in a conspicuous place in our office. I hope, before you have occasion to publish another edition, we may be able to furnish you a better account of ourselves.

With great respect sir,

Your very obedient servant,

WM. P. PREBLE.

We hope to be able to continue these corrections, until we hear from every road in the country.

Bridging the Ohio.

The Ohio is in a fair way to be bridged; we hear, at Wheeling, Va. One of the papers of that city, of a late date, says that circumstances are such as to give us full assurance that the company will be formed under the charter of last winter to erect a bridge over the Ohio, the stock taken, and the contract made at as early a day as possible, probably during the present summer. The stock is \$200,000.

Large Iron Shafts.

The Louisville Democrat says that, at Yeatman & Shields' foundry, in that city, there are two iron shafts just cast for the steamboat Magnolia, weighing each 11 tons—each 20 feet 2 inches long. The journals measure 13 and 17 inches. The shafts were perfect, and made in three days from the time the order was received; the patterns, of course, be-

ing made in this time. They are the largest shafts ever cast in that city.

Rutland Road.

The work upon this road, says the Burlington Free press, is steadily advancing. It is understood from the contractor, that several pits have been sunk at the crossing of the creek in Shelburne, preparatory to the commencement of the work of constructing the piers for the bridge at that place.

We are glad to learn that, by an arrangement between the parties, Messrs. Chamberlain, Worrall and Walker, have become partners with Messrs. J. Bradley and T. F. Strong, in the contract for the construction of the road from Burlington to Brandon. Messrs. Chamberlain & Co. have been engaged on the public works in Pennsylvania, and are now constructing the ship canals on the St. Lawrence in Canada. Their reputation, as accomplished and thorough-going business men, and their well-known experience and ability, afford the best guaranty for the speedy and successful prosecution of the work on the northern division of the Rutland road.

A contract has been entered into with Mr. Horace Gray of Boston, for the rails for the whole road from Bellows Falls to Burlington. Mr. Gray takes stock to the amount of \$140,000, in addition to his subscription of \$20,000, and furnishes rails (of 60 lbs. to the yard) on terms more favorable, as we are informed, than have heretofore been made with him.

The assessment of 5 per cent. on both the Boston and the country stock, has been promptly paid into the treasury, and the work will be prosecuted with all practicable despatch.

This goes to show that the opinions entertained and expressed in the Journal by us in the early agitation of this line of road was correct. We then said, frequently, that this road would surely be constructed—that Boston would do it, at her own cost, if the people on its line did not come up to the mark, by way of securing the trade of Western Vermont. It is of too much value, when taken in connection with Lake Champlain, to be lost, when so small an outlay will open so direct and ready a communication.

Hamilton Railroad.

The citizens of the eastern part of Indiana, says a late number of the Cincinnati Gazette, are on the alert, to raise the means for constructing a railway to connect Cincinnati with Indianapolis. In New Richmond a good spirit prevails. They look upon it as certain that the road to Hamilton will be made, and are taking active measures to connect themselves with it, and to push the line forward through the State to Terra Haute, under the charter granted by the Legislature of that State.

The citizens of Darke county have called a public meeting, to be held at Greenville, on the 3d proximo, to devise the way of connecting that town with Eaton, Hamilton, and Cincinnati.

In Preble county also, the subject of the road from Hamilton, on through Eaton to Indiana, is under discussion, and measures are contemplated to further the object.

It behooves Cincinnati, continues the Gazette, to look to the matter in season, in order to secure the road through Indianapolis, to the northwest, and also to St. Louis. The road to Hamilton, must and will be made; but whether it is to be done soon, or to be postponed to a more convenient season—to some future time, depends upon our citizens. If we come forward and take a due portion of the stock, it may be all graded the present season. The stock can be raised if the property holders in the western and northwestern parts of the city take hold of it as

men should do, having in view a public advantage as well as their own private interest. The gain to these gentlemen is certain, and the amount must be large. Their interest, if nothing else, should prompt them to exert themselves to push the work forward, and to set good examples in the way of liberal subscriptions.

We notice that the proposed company to construct a railway from Dayton through Lebanon to the Little Miami road, is about to be organized. A meeting has been called to elect directors.

Railroad Intelligence.

The Danvers railroad to Boston, which has for so long a time been an obstinately contested question, and which has taken up so much of the time of the present and past Massachusetts Legislatures, is likely to be brought to a conclusion. It is rumored that the Railroad Committee to which the subject has been committed, have decided to report in favor of the South Reading route, which bears the name of the Salem and Lowell railroad, giving to the Danvers petitioners an entrance into Boston through the Boston and Maine railroad, though not so straight and short as by the route through Malden. If this report is correct, if the committee's bill shall pass through the Legislature, and if the road shall be built, a most exciting subject of railroad legislation will be taken away, and it is to be hoped that the compromise will be acceptable to all the parties.

We understand, says the St. Johnsbury Caledonian, that the engineers of the Connecticut and Passumpsic Rivers railroad, have been engaged for the last two or three weeks in completing the locating survey of the White River division, and that the whole line will be ready for contracting by the 1st of May as far as Wells river. It is understood that this portion of the road is to be put under contract as soon as the necessary surveys are completed, and the work prosecuted with a view to its completion in the summer of 1848.

We learn from the Portland Argus, that the amount of stock taken by the citizens of Portland and vicinity in the Androscoggin and Kennebec road, is something rising \$110,000; on which there has been paid into the treasury in cash, something rising \$5,500—being 5 per cent. on the stock subscribed for. At the meeting of the Directors last week, it was ascertained that the preliminary surveys would be completed in the course of the week. The business of the company is placed upon a solid basis, and is progressing as rapidly as circumstances will admit.

The N. Y. Commercial Advertiser says that the stock of the Watertown and Rome, N. Y., railroad has been taken, and adds:—This will be another important link to the eastern seaboard, and will add in no small degree to the value of the Hudson railroad. Our Boston friends are pushing on the line to Ogdensburg, which will be another link to their immense chain of railroads; while they are showing such activity, New Yorkers should be awake to their own interests.

Within the last two years the passengers transported between New York and Boston were conveyed at an average cost, for first class passengers, not exceeding a cent and a half per mile. So says the Boston Daily Advertiser.

The Housatonic railroad company have declared a dividend of four per cent. on the preferred capital.

At the last advices, the workmen had nearly completed their labors on the Paris and Havre railway, and it was expected that the commission of roads and bridges charged with inspecting the entire railway and with making a final report on the state of

the work, would enter upon their duties on the 4th of March. There was every expectation of a favorable report, and that no obstacle would delay active operations, which would commence simultaneously for the conveyance of persons and property, the company being ready at all points, and wanting nothing but authority to proceed. The inauguration, it was thought, would take place March 15th, or at farthest before the end of the month.

The Portsmouth Journal says—We have much pleasure in being able to announce that the balance of the stock required to be subscribed before commencing the first section of the road to extend to New Market has been taken up—the directors having assumed the balance, (although they were before the largest subscribers) to enable them to commence the work forthwith. We also learn that an experienced and skilful engineer, Mr. Hall, is now engaged in making a re-examination and survey of the line as laid out to New Market; and that as soon as the road is finally located, probably in the course of next week, the directors will be ready to enter into contracts for grading the road. The first assessment on the shares has been made payable on or before the 26th inst.; interest to be allowed from the day of payment, and some have already paid their assessments.

The Columbus (Geo.) Times of the 22d ult., says. We learn that engineers of the Macon and Western railway, are surveying the route from Barnesville to Flint river; and that that go ahead company intend to complete the new road in a year. If so, Columbus must suffer in her trade every day that our end of the line remains unconnected with that at the Flint.

The Directors of the Atlantic and St. Lawrence road have ordered the location to the South Village in Paris. They have also ordered the section between Auburn and Mechanic Falls to be put under contract for grading forthwith.

Our Portland friends, says the Paris Democrat, anticipate that the "iron horse" will come snorting into their beautiful city from the northeast, as early as November next, and we have little doubt their anticipations will be realized. Success to them.

It was stated by S. S. Lewis, Esq., says the Boston Bee, at a late meeting of the company, to one of the legislative railroad committees, that the plan of constructing a railroad partly around the metropolis, so as to connect all the interior railroads with deep water at East Boston—was so far matured that he had already received the promise of subscription for a large part of the capital stock, \$1,200,000. The Chelsea Branch railroad is a part of this line, and the Eastern railroad has applied for leave to subscribe for a portion of its stock. We published an article in relation to this matter from a Lowell paper, some weeks since. It would seem from the above, that there is considerable probability of the accomplishment, eventually, of such an enterprize. The project goes to show the great principle of improvement, lately brought out so clearly, that the interior demands connexion, not merely with commercial towns, but with the sea itself. Deep water is almost as necessary a terminus of a great railroad, at one end, as a productive and populous country is at the other.

The railroad spirit shows no abatement, says a late Newark paper, in the hills and villages on the Delaware. Four public meetings are advertised to be held in different villages of Warren county, between this day and Monday, to consider measures for making a railroad communication between Belvidere and the sea board.

#### Another "Mammoth" for the Sound.

A magnificent new boat, to be called the "BAY STATE," is now in course of completion, in New York, intended to ply on the new route to Boston, via Fall river. She was constructed by Messrs. Lawrence & Sneyden, under the immediate superintendence of J. J. Comstock, formerly the commander of the Massachusetts, and is 300 feet in length, 45 feet beam, with 15 feet depth of hold; her cylinder is 76 inches, 12 feet stroke; diameter of wheel, 43 feet; 1,700 tons burthen and 1,500 horse power. Her engine and boilers are from the foundry of James P. Allaire. She is furnished with 50 state rooms and 500 berths, fitted up in splendid style, and the safety of the passengers is secured by extra life boats and patent life preservers, besides having three masts, on which she can use her canvass when necessary. This floating palace will take her place on the line about the 1st of May, under the command of Capt. Comstock, whose reputation as a skilful navigator and for gentlemanly deportment, is well known to the travelling community. The Massachusetts will run on alternate days with this boat—which is said to be a splendid affair—and promises to be one of the finest ever built in this country.

#### Plank Roads.

We published, in a recent number of the Journal, a well written article from the pen of JAMES CULL, Esq., Civil Engineer, of Kingston, Canada West, in which he promised to give us another article, treating at length of Plank roads—and we now have the pleasure of acknowledging the receipt of the article alluded to, which we give at length in this number, in the hope that it may be copied into many of our exchange papers, for the benefit of thousands who cannot have the advantage of railroads. They must be eminently useful to villages, and in the new country where the soil is deep and soft—and not, comparatively, expensive.

We desire to call the special attention of our readers to Mr. Cull's remarks on the subject, and to him as a suitable person to be employed in their construction, as he has evidently both science and practice in this almost new science of road-making.

For the American Railroad Journal.

**Plank Roads.**—The adoption of plank and timber roads was first recommended by the writer of this article, accompanied with models, and laid before the Canadian Provincial Parliament, in the year 1833.

The models were of three descriptions.

First. The common plank road, 14 feet wide and 3 inches thick, laid upon five longitudinal sleepers. Second. A plank road 28 feet wide, and which combined the two objects—of a plank road for ordinary purposes, and a railroad, the rail being of hard wood, with or without an iron rail.

Third. A timber road made with logs, as will be hereafter described. Having been employed upon the Liverpool and Manchester railroad in England, and which was just completed, and having had frequent opportunities of testing the value and durability of timber railroads, called tram roads, I had necessarily acquired a good deal of information upon the comparative advantages and disadvantages of both these descriptions of roads.

The ordinary plank road was treated with everything but respect by the Canadian Legislature at that time of day. It would rot, or wear out in three years. It would be burnt up. The plank would be stolen. The expense would ruin the country; and the whole thing was treated as the fanciful production of a speculative mind—and not a few of the wise men said the old roads had been good enough for their

fathers, and why were they not good enough for them? No effort was made to try the value of plank roads till the summer of 1835, when three or four miles were laid on the road between Toronto and Kingston, and paid for out of a loan granted by Parliament to make a Macadamized road.

It was soon found that none of the anticipated objections were realized. Instead of wearing out or decaying in three years, no repairs were made for upwards of seven years, and even then the plank had lost by wear only about three-fourths of an inch, not a foot of it had ever been burnt or stolen; and as little grading was necessary, in consequence of the level state of the country, instead of costing upwards of £2000 per mile, which the first four miles of Macadamized road had cost, the plank road was made for between £500 and £600 for the timber portion of it, and about £150 for the grading, ditching, etc. This was the first experiment of a plank road.

The plank was partly pine, partly hemlock, and partly oak. The first four miles of Macadamized road out of Toronto, which had cost in its original construction upwards of £2000 per mile, had also cost an enormous sum in repair, nearly as much as it cost originally, in four years, in consequence of the commissioners having employed one of the foremen of the engineers, who made the Youngs street road—with a view of saving £24 per day in salary—a man who was ignorant of the science of either draining or road making; the consequence of which was, that the road went down in many places, and they were actually obliged to plank over it—exhibiting, if anything ever did, the old adage of "penny wise and pound foolish."

The writer had frequent opportunities of examining these few miles of plank road, and so completely caulked were the joints, by the pressing into them by the action of the wheels and the feet of the horses, the small chips which were torn off, together with the dropping from the horses, etc., that a strong iron bar was broken in taking up the boards to examine them. The only fastening they had was one, or in a wide plank two 6-inch spikes at each end of the plank. The scantling for the sleepers, which were of the same material with the plank, was 6 by 8. The road bed was made as solid as possible, and the earth was rammed in between the sleepers; and experience has since proved, that on this being effectually done, so that the plank rested firmly on the earth, as well as on the ground joists, depended the protection from decay of both, and the absence of springing, by which the wear is much increased, a fact fully proved by the rapidity with which plank on a bridge wears out, compared with that of a firmly laid plank road: although it must not be forgotten that from bridges being generally elevated, the increased power of the horses to surmount the elevation, necessarily produces increased wear and tear, as well as the spring or deflection, which is produced by the elasticity of the frame work in bridges.

The plank was laid across the road, and was, as before stated, 16 feet long.

**Remarks.**—The great requisites in the construction of plank roads, are as follows:

First. Sound timber, of the proper age, and cut at the proper season of the year. Timber, like everything else, can only endure a certain length of time, and like everything else, also, has its period of growth, maturity and natural decay.

Too little attention is paid to this fact in Canada, or, more properly speaking, no attention at all is given to the subject—if it be plank of given dimensions it is quite enough.

The cutting timber at a proper time of the year, (perhaps January is the best time,) is even more important than its age; it has been well ascertained that timber, cut with the sap up in it, will decay in less than half the time that it will when cut in winter; nor can this be difficult of accounting for; it is the sap which contains the fermentable matter, and fermentation is the first step to decomposition—hence the value of those preserving processes called kyanizing, and other processes of inserting into the sap a substance which acts upon one of its constituent parts, which bears a strict analogy to albumen, which, when decomposed by corrosive sublimate, sulphate of copper, and many other substances, becomes indecomposable, and renders the sappy portions of timber as durable as the spine, and greatly adds to the durability of the latter. It is believed that it is good economy to submit the plank intended for roads to these processes, when it will be found to endure, without repair, for ten, or even, twelve years, or probably a longer period.

The next thing of importance in the construction of plank roads, is strict attention to the laying both the longitudinal timbers, as well as the plank, perfectly solid, so as to prevent springing and deflection. A moment's consideration will show that a plank laying loosely on the ground, springing under the weight of horses or wheels, will wear out in half the time that one laying solidly embedded will do; this is caused in two ways, the wear is naturally greater by the double action of the plank and the horses feet—but it is also caused by the increased traction which is produced by plank laying loosely, over that which is produced when they are perfectly firm and non-elastic; in the former case, where the road yields to the wheel, and bends beneath it, the carriage is always as it were going up hill; that is, if the plank be one foot wide, and it deflects or bends one-eighth of an inch, the wheel has to surmount an obstacle equal to the rise of the one-eighth of an inch in six inches, or 1 in 48, and so in any other proportion, whether greater or less.

It is therefore of the greatest importance, with a view to the durability of the plank, as well as to the ease with which animals travel on plank roads, that they should lay as solidly as possible, not only on the sleepers, but also that the earth between the sleepers should be rammed, or made otherwise as hard as possible, and that the plank should bear solidly upon it. One remarkable fact has presented itself, as it regards the traction on plank roads, and which fully proves the truth of the foregoing observations; it is found that the "legs" of horses which travel on plank roads, give out much sooner than they do on Macadamized roads; their "feet" suffer most especially with injudicious shoeing on the latter, but the muscles of the legs are evidently more tired and injured on the former, a tolerably conclusive proof, that however plank roads may be more agreeable to the traveller than Macadamized roads, they are less favorable to animal power.

**Blinding.**—It has been the fashion in Canada, on some roads, to strew sand or very fine gravel on plank roads, two or three inches thick. Experience and observation have convinced me; that while it is an useless expense, it is injurious to the road in more ways than one, it increases the traction, and consequently adds to the wear of the plank. Small stones are necessarily forced into the plank by the weight of the horses and by the action of the wheels, into these cavities the water finds its way to the centre of the plank, and causes incipient decay; it spoils the sleighing in winter, and produces clouds of dust in summer.

The first plank roads were never blinded, and they have assuredly proved the most durable.

Experience, I believe, has fully proved that the best blinding is the small chips taken off by the shoes of the horses, and by the action of the wheels, together with the droppings from animals, which sufficiently saves the wear of plank without the disadvantages of either clay, sand or gravel. With a view to prevent these lighter substances from being washed off the road by heavy rains, the plank should be laid as nearly level as possible; and it will be found that roads thus made will give the earliest and latest, as well as the best sleighing, and be more durable than if laid in any other way.

**Widths of Plank Roads.**—Various experiments have been tried as to the most convenient width of plank roads; we have made them with plank 16, 14 and 12 feet long. Upon the whole, taking economy and utility into the question, I am of opinion that 12 feet is the best width on ordinary roads, a few miles distant from cities and towns; a common wagon scarcely occupies 6 feet, and we have found that two carriages can pass each other very well on a plank road 12 feet wide, but a longitudinal string-piece, of hard wood, down the middle of the road, about six inches high, treenailed down to the sleepers, is indispensable; this string-piece is not continuous, but has a convenient number of breaks or spaces to enable carriages to pass from one side to the other, if necessary. It is found by experience, that the earth which forms the abutments to plank roads, if properly laid, becomes so firm and solid, that it does not yield in any material degree to even a heavily loaded wagon, by the outside wheels merely once going on it; and it must be recollected that the chances are a thousand to one, or more, of two wagons meeting exactly in the same spot, so as to require a repetition of breaking out twice in the same track.

If the road be not twelve feet wide, eight feet is as good as any greater width, especially on lines where the amount of travel is not great, such a road will be found to be invaluable, and will cost as little as any kind of road which can be made.

**Method of Laying the Plank.**—The first impression with respect to the way the plank should be laid, was in favor of laying it longitudinally, for the following reason. If the finger nail be passed over a pine board, planed ever so smoothly, across the grain, it will obviously present a rougher surface than if passed lengthwise with the grain, and doubtless, so far as wear is concerned, fewer chips would be taken up by horses feet, if laid lengthwise, than if laid across the road. The objection is of two kinds—first, that unless the joists are laid very close, a considerable spring or deflection will take place; and, secondly, it has been found that horses smoothly shot will slip upon them when so laid; besides which, if the horses shoes wear the plank less, the wheels will wear it more; under all circumstances, it is believed that the crosswise is better than the lengthwise.

With a view to make the twelve feet plank answer the purpose without waste, it was suggested to lay the plank diagonally; this was tried, and found to be disadvantageous, as will easily appear on examination.

The fact is, that on planks laid diagonally, the two wheels of a carriage are never on the same plank at the same time, and the consequence is, that the pressure on one side the plank, without a corresponding pressure on the other side, produces a spring which is felt by the spike by which the plank is fastened, it soon works loose, and the head of the spike

comes through the plank—all which circumstances are against a firm, unyielding and durable plank road.

**Sleepers.**—It has been suggested to lay plank roads on the natural soil without sleepers, or to lay them with only two outside sleepers. If the foregoing remarks are good for anything, doing either must be a failure. Where the attempt has been made, the writer has seen the water under the plank splashing up, by the weight of the horses, to his very girths—proof enough that the traction upon such a road must be great, consequently increased wear and tear of the plank and a disadvantageous waste of the moving power.

The foregoing will communicate to your readers all the information which has been obtained from our experience in Canada on "PLANK" roads.

The second kind of plank roads submitted to the Provincial Parliament was constructed in the following manner: cross beams were to be laid at certain distances, proportioned to the weight to be carried on the road; in hard ground to be on blocks, and in deep soft soils upon piles; the blocks to consist of pieces of timber of a conical form, with the large end downwards, at least four feet deep, to be out of the reach of the frost; the piles to be driven till they would bear the required weight.

The cross beams to be provided with a shoulder within a foot of the ends against which the timber which constitutes the roadway should abut, through this a mortise should be cut, to receive a wedge for the purpose of driving the timber of the roadway close together, which timbers were to be laid lengthwise, to be of scantling 6 by 6. The centre part to be 16 feet wide, on which are to be driven the common carriages of the country; and on each side to be two wooden rails, nine inches deep and four inches wide, to consist of the hardest wood which can be obtained, to be placed at such distance apart as it shall be determined to have the gauges; between the rails are to be laid timbers the same as the roadway, 6 by 6, and the rails will consequently be three inches above the roadway.

The timbers constituting the road to be doweled so as to form a mass of solid timber, and by being driven up by the wedges will bring the joints close together, and keep them so in case of shrinkage. It is believed that such a road will possess all the combined advantages of a good plank road together with a double railroad.

The third kind of road suggested, consisted of logs flattened, and sawed down the middle, laid with their rounded parts downwards, and the hewed edges abutting against each other, and doweled, the whole resting on cross beams, similar to those designed for the foregoing road, and provided in the same manner with wedges to keep the whole compact. It has been considered that this will form the cheapest, the most durable and easily constructed road which has been proposed.

There is also another method of making a good, cheap and substantial road, of a very simple kind, which I have made to a considerable extent, and which has been greatly approved of; it consists of the common split fence rails, packed well together, and covered with three or four inches of clay taken from the side ditches; the rails should be well split out of straight grained timber; each rail will occupy about six inches, and will take consequently six rails to a lineal yard, they will embed themselves, and will last for eight or ten years, even if exposed to the wear and tear of very heavy loads.

I remain, Mr. Editor, your obedient servant,  
JAMES CULL, Civil Engineer, &c.

## MASSACHUSETTS ANNUAL RAILROAD REPORTS.

## Return of the Eastern Railroad Company, under the Act of April 16, 1846.

Capital stock.....	\$1,800,000

For engineering and other expenses, paid during the past year.....	142,028 81
Total amount expended for engineering and other expenses.....	
Total cost of road and equipment.....	2,220,868 81
CHARACTERISTICS OF ROAD.	
Length of road.....	38 miles 1063 feet.
Length of single track.....	38 " "
Length of double track.....	16 miles.
Length of branches owned by the company, stating whether they have a single or double track.....	3 miles, single track.
Weight of rail per yard in main road.....	46 pounds.
Weight of rail per yard in branch roads.....	46 " "
Maximum grade, with its length in main road.....	40 feet, length 379 feet.
Maximum grade, with its length in branch roads.....	40 " "
Total rise and fall in main road, [total ascent 310, 969, descent 267,310].....	578,379 feet.
Total rise and fall in branch roads.....	
Shortest radius of curvature, with length of curve in main road.....	1146 ft.; length 1100 ft.
Shortest radius of curvature, with length of curve in branch roads.....	900 feet.
Total degrees of curvature in main road.....	450 feet.
Total degrees of curvature in branch roads.....	
Total length of straight-line in main road.....	28 miles, 4980 feet.
Total length of straight-lines in branches.....	1 mile, 3310 feet.
Aggregate length of truss bridges.....	
Whole length of road unfinished on both sides.....	
DOINGS DURING THE YEAR.	
Miles run by passenger trains.....	201,626
Miles run by freight trains.....	33,680
Miles run by other trains.....	17,746
Total miles run.....	253,052

Number of passengers carried in the cars.....	766,756
Number of passengers carried one mile.....	12,575,386
Number of tons of merchandise carried in the cars.....	38,0134
Number of tons of merchandise carried one mile.....	1,090,4424
Number of passengers carried one mile, to and from other roads.....	
Number of tons carried one mile, to and from other roads.....	
Average rate of speed adopted for passenger trains, including stops.....	31 miles.
Average rate of speed adopted for freight trains, including stops.....	15 miles.
Estimated weight in tons of passenger trains, including engine and tender, but not including passengers, hauled one mile.....	50 tons.
Estimated weight of merchandise trains, including engine and tender, but not including freight, hauled one mile.....	90 tons.

EXPENDITURES FOR WORKING THE ROAD.	
For repairs of road, maintenance of way, exclusive of wooden truss bridges and renewals of iron.....	\$17,918 91
For repairs of truss bridges.....	11,711 97
For renewals of iron, including laying down.....	
For wages of switch-men, gate-keepers and flag-men.....	2,326 25
For removing ice and snow.....	
For repairs of fences, gates, houses for flag-men, gate-keepers, switch-men, tool-houses.....	176 60
Total for maintenance of way.....	21,439 82

MOTIVE POWERS.	
For repairs of locomotives.....	6,679 90
For new locomotives to cover depreciation.....	
For repairs of passenger cars.....	6,655 57
For new passenger cars to cover depreciation.....	
For repairs of merchandise cars.....	1,180 01
For new merchandise cars to cover depreciation.....	
For repairs of gravel and other cars.....	39 60
Total for maintenance of motive power.....	14,778 08

MISCELLANEOUS.	
For fuel and oil.....	33,279 73
For salaries, wages and incidental expenses, chargeable to passenger department.....	23,194 87
For salaries, wages and incidental expenses, chargeable to freight department.....	2,680 04
For gratuities and damages.....	551 75
For taxes and insurance.....	8,413 26
For ferries.....	
For repairs of station building, aqueducts, fixtures, furniture.....	576 56
For interest.....	30,248 39
For amount paid other companies in tolls for passengers and freight carried on their roads, specifying each company.....	
For amount paid other companies as rent for use of their roads, specifying each company.....	
For salaries of president, treasurer, superintendent, law expenses, office expenses of the above officers, and all other expenses not included in any of the foregoing items.....	27,819 07
	162,804 57

INCOME DURING THE YEAR.

ESTIMATED DEPRECIATION BEYOND RENEWALS, FOR:	
Road and bridges.....	
Buildings.....	
Engines and cars.....	6,000 00

During the year.....

To the Honorable the Senate and House of Representatives, in General Court assembled:

The Directors of the Eastern railroad present their Eleventh Annual Report in the form prescribed by law. Some explanation may be required.

The capital is stated at.....	\$1,800,000 00
During the past year an order was passed by the directors for the creation of 4390 new shares on the 1st of January, 1847, and made payable in assessments on the 1st July, 1st September, 1846, and January, 1847—and on them has been paid in, and is included in amount above stated of floating debt, 31st December, the sum of.....	374,833 06
It also includes balance of renewal and sinking funds.....	101,778 34
And, with the funded debt, \$500,000, and other liabilities, makes up the amount of.....	2,811,133 06
In the cost of the road and equipment is included the amount standing to construction account.....	2,220,868 81
And to property accounts.....	273,309 87
Which, together, show an actual expenditure of.....	2,494,268 68
The property having been estimated at its market value in 1843, which was about \$59,000 more than it had actually cost—thereby allowing that sum for deterioration.	
Also expended for improvements not completed.....	51,763 33
Also expended for new tracks, do. do.....	31,119 85
Also expended for Gloucester and Salisbury branches, do. do.....	156,480 94
Also expended for railroad iron on hand.....	85,100 34
	2,815,133 14

It should be stated that the above includes equipment for the Eastern railroad in New Hampshire, which has a capital of 4825 shares of \$100 each, which are entitled, as rent, to the same dividends as the stock in the Eastern railroad.

The two branches above named will be ready for the superstructure as soon as the season will permit.

No passenger has been injured in the cars during the year. In November, a woman, in attempting to get into the cars after they had started, fell on the track, and had her arm broken.

Two dividends, of \$1 per share, have been declared during the year, amounting, with the payments to the New Hampshire road, to \$182,600.

Respectfully submitted.—D. A. Neal, John Hooper, Isaiah Breed, Daniel Adams, John Bryant, Jr., John Eliot Thayer.

#### Baltimore and Pittsburgh.

The Pittsburgh Gazette of Monday week contains the following official account of the proceedings of the meeting held there on Saturday.

#### Stockholders' Meeting.—Pittsburg and Connellsville Railroad Company.

PITTSBURG, March 27, 1847.

In pursuance of adjournment, the stockholders of the Pittsburg and Connellsville railroad company met this day at 3 P. M., and were called to order by Wm. Eichbaum, Esq., chairman.

Thomas Bakewell, Esq., from the committee to report resolutions, submitted the following preamble and resolutions, which, upon due consideration, were unanimously adopted.

Whereas, A communication having been received from a committee of the Baltimore and Ohio railroad company, announcing its appointment and intention to visit this city for the purpose of renewing negotiations with this company, it is proper and becoming that said committee, before leaving home on the

business entrusted to them, should be made acquainted with the present disposition of the stockholders of this company. Therefore,

Resolved, That the stockholders of this company cannot perceive any thing in the late action of the stockholders of the B. & O. R. R. Co.—especially when taken in connection with the remarks of the President, when he says—"If the company were to decide upon one terminus, and direct its undivided resources toward the completion of one road to one terminus, and that were to be either Pittsburg or Wheeling, then Wheeling was, beyond question the desirable point," which would justify this company in revoking the resolution of the 25th February, or that holds out any reasonable prospect of a favorable issue of further negotiations while such counsels prevail.

Resolved, That if a substantive proposition shall have been made antecedent to the 25th of next April, duly authorized by the stockholders of that company, expressing their willingness to devote their undivided energies to the connection with this city by the shortest and cheapest route, then the President and Directors of this company are hereby authorized to reopen negotiations for the settlement of preliminaries, and report to a future meeting of the stockholders to be held for that purpose.

Resolved, That if the committee of the Baltimore and Ohio railroad company shall, under their instructions, visit this city, the President and Directors of this company are requested to tender them a hospitable reception, and afford them every facility of becoming acquainted with the manufacturing and commercial resources of this city, and the advantages it presents to their company, and to the city of Baltimore, as the point of connection with the Ohio river.

Resolved, N. B. Craig, Thos. Bakewell, Wm. Ebbs, Geo. Darsie and E. D. Gazzam, be a committee to communicate a copy of these proceedings to the committee of the Baltimore and Ohio railroad company, as expressive of the sentiments of this meeting.

Resolved, That when this meeting adjourns, it will adjourn to meet again on the 27th of April next, unless sooner convened, for the purpose of receiving the report of the various committees, appointed at this meeting, and of considering such other business as may be brought before them.

WM. EICHBAUM, Chairman.

Edw'd Gazzam, Secretary.

#### ITEMS.

**The Mail Steamers.**—The Washington correspondent of the New York Herald has the following concerning the command of the government mail steamers for Liverpool:—It is understood that the Secretary of the Navy will require that each of the steamers of the Liverpool line shall be commanded by an officer of the navy, not under the grade of a lieutenant, otherwise he assumes that the four midshipmen set apart as watch officers in the bill to each ship, will be rather calculated to excite insubordination and mischief than the object of regular trips and naval regularity, and that they must have a superior officer on

board. The Liverpool line, therefore, in the respect of a commanding officer, will be subject to the same control as the line to Havana and New Orleans, and the collateral line from Havana to Chagres. The Congress bill does not exact a naval officer as commander to the Liverpool steamers, but the Secretary of the Navy will make it a condition to Mr. Collins' contract, and it will be so far an advantage to the contractor.

**Another Feather in the Cap of American Enterprise.**—Mr. Leon Lewenberg, of Williamsburg, has recently completed a large Refracting Telescope out of American materials. It has eight and a half inches aperture, and a focal distance of 14 feet. It is mounted on a convenient carriage, with all the necessary apparatus for direction, and its weight is half a ton. This instrument can be afforded for \$5000, and is pronounced by competent judges to be equal to those of Europe which cost \$10,000. A committee from the American Institute, are about to ask permission of the Common Council, to exhibit this telescope to the citizens of New York—for which purpose they will ask the privilege of erecting a temporary shed in the Park, opposite the City Hall. The aperture of this telescope is half an inch wider than that in the Cincinnati telescope; the cost of which was \$14,000.

**The Schuylkill Navigation.**—The water has been let into the Schuylkill Navigation, throughout its entire length, and it is thought the first boat of the season will leave Pottsville by about Monday next, freighted with coal. The amount of coal shipped from this region during the year 1846, was very little short of a million and a half of tons. The Schuylkill Navigation company were engaged last year in improving and widening their canal, so as to admit the passage of steamboats, and by the time it was completed, winter had set in, so that nearly, if not quite all the coal sent to market during that period went by railroad. In anticipation of the renewal of transportation on the canal, and its large capacity, the mining operations have been very much exhausted. A number of new mines have been opened, and expensive improvements added to those already in operation. We may, therefore, confidently predict a larger amount of shipments of coal for 1847 than any preceding year.—Pottsville Register, March 27.

**The Rutland Road.**—The work is going on at four points this side of Mount Holly, and the Mount Holly sections are to be commenced immediately. The sections in Brandon are progressing, and the remainder of the line, the President informs us, will be immediately put under contract. The Sullivan road is going forward. Our own road, the Cheshire, will now be pressed in every section, as the Directors of the Sullivan and Rutland (the latter the Cavendish at least) profess their determination to be ready to receive the cars as soon as they can arrive at Bellows Falls.—N. H. Sentinel.

**The Railroad.**—Our directors are busy at work doing everything that can be done to insure the earliest construction of the road.

Three corps of engineers have for some time been at work locating the road in different places on the line, and a fourth is being organized this week. Since these active movements, we understand the people in towns on the line are taking a renewed interest in encouraging the work. In Bowdoinham a spirited meeting was held last week, at which the subscription to the stock was encouragingly increased.—Augusta Banner.

**Chesapeake and Ohio Canal.**—We are happy to have it in our power to state that the speedy completion of this great work is now beyond a doubt. Hon. John Davis, Ex-Governor of Massachusetts, and now U. S. Senator from that State, together with his colleagues, Hon. Daniel Webster, Nathan Hale, Esq., of Boston, and other distinguished individuals, are now in Washington, for the purpose of consummating arrangements whereby the completion of the Chesapeake and Ohio canal is to be forthwith commenced in a manner that will forbid the possibility of another suspension. We understand these gentlemen constitute a commission on the part of the capitalists, who stand ready to advance the money required to accomplish the work.—Wash. Union.

**Railroad Accident.**—An accident occurred on the Boston and Maine railroad lately, at the Wilmington junction, by which, we are sorry to learn that several passengers received some slight bruises, also the baggage-master of the train. The accident was occasioned by the train from Portland overtaking the freight train, which was about backing off to give the passenger train the road. The engine man of the passenger train reversed his engine, and the brakemen applied their breaks in more than usual season; but in consequence of the slippery state of the rails (it was snowing and raining at the time) the train could not be stopped in time to avoid a collision. The baggage car was badly broken, and the forward passenger car considerably injured. The smoke pipe of the engine was knocked off, and several of the freight cars slightly damaged.

### BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

### MISSING NUMBERS

#### OF THE RAILROAD JOURNAL.

Subscribers, who wish to obtain Missing Numbers of Back Volumes of this Journal, will do well to apply immediately.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

### ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—

for sale or imported to order by the subscriber. These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,

75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.		Weight per fathom.	Diameter of iron.	
	INCH.	LB. OZ.	INCH.	LB. OZ.		LB.	INCH.	Tons.
11	4½	13 5	10	24 -		50	15-16	20
13	3½	8 3	8½	16 -		27	11-16	13½
14	3½	6 11	7½	12 8		17	9-16	10½
15	2½	5 2	6½	9 4		13½	1-8	7½
16	2½	4 3	6	8 8		10½	7-16	7

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1734

### RAY'S EQUALIZING RAILWAY TRUCK—THE SUBSCRIBER HAVING RECENTLY FORMED A BUSINESS CONNECTION IN THE CITY OF NEW

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846. W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed.] WILLIAM ROG, Supt. of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845. [Signed.] G. A. NICOLL,

Supt. Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

Jersey City, November 4, 1845. [Signed.] T. L. SMITH,

N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot, [Signed.] JOHN LEACH,

Jamaica November 12, 1845. } 1y19 Supt. Motive Power.

**RICH & CO'S IMPROVED PATENT SALAMANDER SAFES.**

Warranted free from dampness, as well as fire and thief proof.

Particular attention is invited to the following certificates, which speak for themselves:

**TEST No. 10.**

*Certificate from Mr. Silas C. Field, of Vicksburg, Mississippi.*

On the morning of the 14th ult., the store owned and occupied by me in this city, was, with its contents, entirely consumed by fire. My stock of goods consisted of oil, rosin, lard, pork, sugar, molasses, liquor, and other articles of a combustible nature, in the midst of which was one of Rich's Improved Patent Salamander Safes, which I purchased last October of Mr. Isaac Bridge, New Orleans, and which contained my books and papers. This safe was not hot, and did not cool sufficiently to be opened until 16 hours after it was taken from the ruins. At the expiration of that time it was unlocked, when its contents proved to be entirely uninjured, and not even discolored. I deem this test sufficient to show that the high reputation enjoyed by Rich's Safes is well merited.

S. C. FIELD.

**TEST No. 11.—Certificate.**

By the fire which occurred in this village on the 27th July last, our Law Office, together with many other buildings, was destroyed—we had in our office one of Rich's Improved Patent Salamander Safes, which, though heated red hot, preserved, without being the least damaged, many papers valuable to our clients—the envelopes of a few papers being slightly scorched. Some twenty-four hours after the fire, the Safe was removed, and so hot was it, that several hours were required for it to cool off. Our office was in the second story of a large brick building, all the wood used in construction of said house being pitch pine. While the Safe was red hot, one of the walls tumbled in, and so injured the lock that it was necessary to break the door open. From this test we feel no hesitancy in recommending "Rich's Patent Salamander Safe" as entirely fire proof.

GORRIS & KING.

Marion, Ala., Sept. 15th, 1846.

*Still other Tests in the Great Fire of July 19, 1845.*

The undersigned purchased of A. S. Martin, No. 138½ Water street, one of Rich's Improved Patent Salamander Safes, which was in our store, No. 54 Exchange place. The store was entirely consumed in the great conflagration on the morning of the 19th inst. The safe was taken from the ruins 52 hours after, and on opening it, the books and papers were found entirely uninjured by fire, and only slightly wet—the leather on some of the books was parched by the extreme heat.

RICHARDS & CRONKHITE.

Benton, Miss., December 27, 1845.

One of Rich's Improved Salamander Safes, which I purchased on the 2d of June last of A. S. Marvin, 138½ Water street, agent for the manufacturer, was exposed to the most intense heat during the late dreadful conflagration. The store which I occupied, No. 46 Broad street, was entirely consumed; the safe fell from the 2d story, about 15 feet, into the cellar, and remained there 14 hours, and when found, I am told, and from its appearance afterwards, should judge that it had been heated to a red heat. On opening it, the books and papers were found not to have been touched by fire. I deem this ordeal sufficient to confirm fully the reputation that Rich's safe has already obtained for preserving its contents against all hazards.

(Signed.)

WM. BLOODGOOD.

New York, 31st July, 1845.

Reference made to upwards of nine hundred and fifty merchants, cashiers, brokers, and officers of courts and counties, who have Rich's Safe's in use.

The above safes are finished in the neatest manner, and can be made to order at short notice, of any size and pattern, and fitted to contain plate, jewelry, etc. Prices from \$50 to \$500 each. For sale by

A. S. MARVIN, General Agent,  
138½ Water st., N. Y.

Also by Isaac Bridge 76 Magazine street, New Orleans.

Also by Lewis M Hatch, 130 Meeting street Charleston, S. C.

16 U

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

TO THOSE INTERESTED IN Railroads, Railroad Directors and Managers are respectfully invited to examine an improved SPARK ARRESTER, recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger and freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Supt Hartford and New Haven Railroad; W. R. M'Kee, Supt Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Supt New Jersey Railroad Trans. Co.; J. Elliott, Supt Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Supt Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Supt Macon Railroad, Macon, Ga.; J. H. Cleveland, Supt Southern Railroad, Monroe, Mich.; M. F. Chittenden, Supt M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckley & Drury, Boston, will be promptly executed. FRENCH & BAIRD.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

•• The letters in the figures refer to the article given in the Journal of June, 1844.

ja45

**PATENT HAMMERED RAILROAD, SHIP**

and Boat Spikes. The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed.

JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y. The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Meritt, New York; J. H. Whitney, do.; E. J. Eting, Philadelphia; Wm. E. Coffin & Co., Boston.

ja45

**MACHINE WORKS OF ROGERS,**

Ketchum & Grosvenor, Paterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR,  
ja45 Paterson, N. J., or 60 Wall street, N. York.

**PATENT RAILROAD, SHIP AND BOAT**

Spikes. The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by J. & J. Townsend, Albany, and the principal iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

•• Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

ja45

**SPRING STEEL FOR LOCOMOTIVES,**

Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1½ to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trelis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trelis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trelis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.	
4,224 Timbers, 11 ft. long, 3 x 6 inches =	
68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	
4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs. at 4½ cts. =	101 25
Workmanship free of patent charge =	600 00

Cost of one mile including the laying of the Rail = \$1,415 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.

Civil Engineer and Patentee.

**BOSTON AND PROVIDENCE RAILROAD.** Passenger Notice. Summer Arrangement. On and after Monday, Sept. 28, 1846, the Passenger Trains will run as follows:

For New York—Night Line, via Stonington. Leaves Boston every day, but Sunday, at 5 p.m. Accommodation Trains, leave Boston at 7½ a.m. and 3½ p.m., and Providence at 8 a.m. and 3½ p.m. Dedham trains, leave Boston at 9 a.m.; 3 p.m., 5½ p.m., and 10½ p.m. Leave Dedham at 8 a.m. and 4½ and 9 p.m. Stoughton trains, leave Boston at 11½ a.m. and 4½ p.m. Leave Stoughton at 8 a.m. and 2½ p.m. All baggage at the risk of the owners thereof.  
J. W. RAYMOND LEE, Sup't.

**BRANCH RAILROAD AND STAGES** Connecting with the Boston and Providence Railroad. Stages connect with the Accommodation trains at the Foxboro' Station, to and from Woonsocket. At the Seekonk Station, to and from Lonsdale, R. I. via Pawtucket. At the Sharon Station, to and from Walpole, Mass. And at Dedham Village Station, to and from Medford, via Medway, Mass. At Providence, to and from Bristol, via Warren, R. I.—Taunton, New Bedford and Fall River cars run in connection with the accommodation trains.

## PHILADELPHIA AND READING RAILROAD.—Passenger Train Arrangement for 1847.

A Passenger Train will leave Philadelphia and Pottsville daily, except Sundays, at 9 o'clock A. M. The Train from Philadelphia arrives at Reading at 12 18 M. The Train from Pottsville arrives at Reading at 10 43 A. M.

Fares.	Miles.	No. 1.	No. 2.
Between Phila. and Pottsville, 92		\$3 50 and \$3 00	
" " Reading, 58		2 25 and 1 90	
" " Pottsville, 34		1 40 and 1 20	

Five minutes allowed at Reading; and three at other way stations.  
Passenger Depot in Philadelphia corner of Broad and Vine streets.

## LEXINGTON AND OHIO RAILROAD.

Trains leave Lexington for Frankfort daily, at 5 o'clock a.m., and 9 p.m. Trains leave Frankfort for Lexington daily, at 8 o'clock a.m. and 2 p.m. Distance, 26 miles. Fare \$1 25. On Sunday but one train, 5 o'clock a.m. from Lexington, and 2 o'clock p.m. from Frankfort. The winter arrangement (after 15th September to 15th March) is 6 o'clock a.m. from Lexington, and ma. 9. from Frankfort, other hours as above.

351y

## BOSTON AND MAINE RAILROAD.

Upper Route, to Portland and the East. SUMMER ARRANGEMENT, April 1, 1847.

**PORTLAND TRAINS.** Leave Boston at 7 A.M. and 2½ P.M. Leave Portland at 7½ A.M. and 3 P.M.

**GREAT FALLS TRAIN.** Leave Boston at 5 P.M. Leave Great Falls at 6½ A.M.

**HAVERHILL TRAINS.** Leave Boston at 11½ A.M. and 6-20 P.M. Leave Haverhill at 6½ A.M. and 4½ P.M.

**READING TRAINS.** Leave Boston at 8½ A.M. and 8½ P.M. Leave Reading at 6 A.M. and 1½ P.M.

**MEDFORD BRANCH TRAINS.** Leave Boston at 7½, 11½ A.M., 9½, 5½, 7 P.M. Leave Medford at 6½, 8 A.M., 1½, 4½, 6 P.M. The Depot in Boston is on Haymarket Square.

Passengers are not allowed to carry Baggage above \$50 in value, and that personal, unless notice is given, and an extra amount paid, at the rate of the price of a Ticket for every \$500 additional value.  
1y31 CHAS. MINOT, Super't.

## SUMMER ARRANGEMENT.—NEW YORK AND ERIE RAILROAD LINE, from April

1st until further notice, will run daily (Sundays excepted) between the city of New York and Middletown, Goshen, and intermediate places, as follows:

### FOR PASSENGERS—

Leave New York at 7 A.M. and 4 P.M. " Middletown at 6½ A.M. and 5½ P.M.

FARE REDUCED TO \$1 25 to Middletown—way in proportion. Breakfast, supper and berths can be had on the steamboat.

### FOR FREIGHT—

Leave New York at 5 P.M. " Middletown at 12 M.

The names of the consignees and of the station where to be left, must be distinctly marked upon each article shipped. Freight not received after 3 P. M. in New York.

Apply to J. F. Clarkson, agent, at office corner of Duane and West sts. H. C. SEYMOUR, Sup't. March 25th, 1846.

Stages run daily from Middletown, on the arrival of the afternoon train, to Milford, Carbondale, Honesdale, Montrose, Towanda, Owego, and West; also to Monticello, Windsor, Binghamton, Ithaca, etc., etc. Agent on board. 13 ff

## NORWICH AND WORCESTER RAILROAD.

Summer Arrangement. Change of Hours. Commencing on Wednesday, April 21, 1847.

Accommodation Trains, daily, (except Sunday.) Leave Norwich at 6 a.m., and 4½ p.m. Leave Worcester, at 6½ a.m., and 4½ p.m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston, and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 2½ p.m. train from Boston.

New York Train via Steamboat—Leave Norwich for Boston, every morning, except Monday, on the arrival of the steamboat from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 6½ p.m., daily, except Sunday, stopping at Danielsonville and Norwich.

Freight Trains daily each way, except Sunday. Leave Norwich at 7, and Worcester at 6 30 a.m. Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are Less when paid for Tickets than when paid in the Cars. J. W. STOWELL, Sup't. 32 1y

**CENTRAL AND MACON AND WESTERN** Railroads, Ga.—These Roads with the Western and Atlantic Railroad of the State of Georgia, form a continuous line from Savannah to Oothcaloga, Ga., of 271 miles, viz:

Savannah to Macon—Central Railroad ..... 190  
Macon to Atlanta—Macon and Western ..... 101  
Atlanta to Oothcaloga—Western and Atlantic ..... 80  
Goods will be carried from Savannah to Atlanta and Oothcaloga, at the following rates, viz:

On Weight Goods—Sugar, Coffee, Liquor, Bagging, Rope, Butter, Cheese, Tobacco, Leather, Hides, Cotton Yarns, Copper, Tin, Bar & Sheet Iron, Hollow Ware & Castings.....	To Atlanta.	To Oothcaloga.
Flour, Rice, Bacon in Casks or boxes, Pork, Beef, Fish, Lard, Tallow, Res-wax, Mill Gearing, Pig Iron and Grind Stones.....	\$0 50	\$0 75
On Measurement Goods—Boxes of Hats, Bonnets and Furniture, per cubic foot.....	0 20	0 26
Boxes and Bales of Dry Goods, Saddlery, Glass, Paints, Drugs and Confectionary, per cubic foot.....	0 20 pr. 100lbs. 35	
Crockery, per cubic foot.....	0 15 "	35
Molasses and Oil, per hhd., (smaller casks in proportion).	9 00	12 50
Ploughs, (large,) Cultivators, Corn Shellers, and Straw Cutters, each.....	1 25	1 50
Ploughs, (small,) and Wheelbarrows.....	0 80	1 05
Salt, per Liverpool Sack.....	0 70	0 95
Passage—Savannah to Atlanta, \$10; Children, under 12 years of age, half price, Savannah to Macon, \$7.		

Goods consigned to the subscriber will be forwarded free of Commissions.  
Freight may be paid at Savannah, Atlanta or Oothcaloga.

F. WINTER, Forwarding Agent, C. R. R.  
Savannah, Aug. 15th, 1846.

**GREAT SOUTHERN MAIL LINE VIA** Washington city, Richmond, Petersburg, Weldon and Charleston, S. C., direct to New Orleans. The only Line which carries the Great Southern Mail, and Twenty-four Hours in advance of Bay Line, leaving Baltimore same day.

Passengers leaving New York at 4 P.M., Philadelphia at 10 P.M., and Baltimore at 6 A.M., proceed without delay at any point, by this line, reaching Richmond in eleven, Petersburg in thirteen and a half hours, and Charleston, S. C., in two days from Baltimore.

Fare from Baltimore to Charleston.....\$21 00  
" " " Richmond..... 6 60

For Tickets, or further information, apply at the Southern Ticket Office, adjoining the Washington Railroad Office, Pratt street, Baltimore, to  
STOCTON & FALLS, Agents.

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, and the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLIOTT & ABBOTT.  
Factory, 5th street, near Coates, cor. Melon st.  
Office, No. 3 North 5th street,  
Philadelphia, Pa.

1y25

**SOUTH CAROLINA RAILROAD.—A** Passenger Train runs daily from Charleston, S.C., on the arrival of the boats from Wilmington, N. C., in connection with trains on the Georgia, and Western and Atlantic Railroads—and by stage lines and steamers connects with the Montgomery and West Point, and the Tuscumbia Railroad in N. Alabama.

Fare through from Charleston to Montgomery daily.....\$26 50  
Fare through from Charleston to Huntsville, Decatur and Tuscumbia..... 20 00

The South Carolina Railroad Co. engage to receive merchandise consigned to their order, and to forward the same to any point on their road; and to the different stations on the Georgia and Western and Atlantic railroad; and to Montgomery, Ala., by the West Point and Montgomery Railroad.  
1y25 JOHN KING, Jr, Agent.

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

THOMAS & EDMUND GEORGE,  
445 N. E. cor. 12th and Market sts., Philad., Pa.

**RAILROAD IRON.—THE "MONTGOMERY"** Iron Company, Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to  
MURDOCK, LEAVITT & CO.,  
Agents.

1y48 77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC CEMENT.** This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floods and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight papered barrels, by  
JOHN W. LAWRENCE,  
149 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 32 17

**A. & G. RALSTON & CO., NO. 4** South Front St., Philadelphia, Pa.

Have now on hand, for sale, Railroad Iron, viz: 180 tons 2 1/2 x 1/2 inch Flat Punched Rails, 30 ft. long. 25 " 2 1/2 x 1/2 " Flange Iron Rails. 75 " 1 x 1/2 " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures. 1lf

**LOCOMOTIVE AND CAR AXLES.** The Subscribers are now prepared to receive orders for the well known and approved Reading Locomotive and Car Axles—drawn to any required pattern from Bloom Iron only. Address  
SAM'L KIMBER & CO.,  
Willow Street Wharf,  
Philadelphia, Pa.

4tf

**BACK VOLUMES OF THE RAILROAD JOURNAL** for sale at the office, No. 105 Chestnut street.

**RAILROAD IRON.—THE NEW JERSEY** Iron Company, Boonton, N. J., are now preparing to make Railroad Bars, and are ready to take orders or make contracts for Rails, deliverable after the first of December next. Apply to  
FULLER & BROWN, Agent.

No. 139 Greenwich, corner of Cedar street.  
September 18, 1846. 10c39

**RAILROAD IRON.—THE SUBSCRIBER'S** New Rail Iron Mill at Phoenixville, Pa., is expected to be ready to go into operation by the 1st of September, and will be capable of turning out 30 to 40 tons or finished Rails per day. They are now prepared to receive orders to that extent, deliverable after the 1st of October next, for heavy rails of any pattern now in use, equal in quality and finish to best imported.

**PIG IRON.**—They are also receiving weekly 150 to 200 tons of No. 1 Phoenix Foundry Iron, well adapted for light castings.

REEVES, BUCK & CO.,  
45 North Water St., Philadelphia,  
or by their Agent, ROBT. NICHOLS,  
29 Water St., New York

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee  
G. A. NICOLLS,  
Reading, Pa.

**THE SUBSCRIBER'S AGENTS FOR** the sale of  
Codorus,  
Glendon,  
Spring Mill and  
Valley,  
Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

SAM'L KIMBER & CO.,  
59 North Wharves,  
Philadelphia, Pa.

Jan. 14, 1846. [1y4]  
**RAILWAY IRON.—THE BEST QUALITY** of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by  
DAVIS, BROOKS & CO.,  
Jan. 2. [1lf] 68 Broad St., New York.

**RAILWAY IRON.—DAVIS, BROOKS & CO.,** No. 68 Broad Street, have now in port on Ship-board, 200 Tons of the best English heavy H Rails, 60 lbs. to the lineal yard, which they offer for sale on favorable terms, also, about 6 to 700 Tons now on the way, to arrive shortly, of the same description of Rail. 46tf

**PIG AND BLOOM IRON.—THE SUBSCRIBERS** are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by  
A. WRIGHT & NEPHEW,  
Vine St. Wharf, Philadelphia.

12tf

**THE SUBSCRIBER IS PREPARED TO** execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip,  
New York.

1y10

# NORRIS' LOCOMOTIVE WORKS.

BUSH HILL, PHILADELPHIA, Pennsylvania.

**MANUFACTURE** their Patent 6 Wheel Combined and 8 Wheel Locomotives of the following descriptions, viz:

Class	1,	15 inches	Diameter of	Cylinder,	× 20 inches	Stroke.
"	2,	14	"	"	× 24	"
"	3,	14½	"	"	× 20	"
"	4,	12½	"	"	× 20	"
"	5,	11½	"	"	× 20	"
"	6,	10½	"	"	× 18	"

With Wheels of any dimensions, with their Patent Arrangement for Variable Expansion. Castings of all kinds made to order: and they call attention to their Chilled Wheels, for the Trucks of Locomotives, Tenders and Cars.

NORRIS, BROTHERS.

**KEARNEY FRIE BRICK. F. W. BRINLEY**, Manufacturer, Perth Amboy, N. J. Guaranteed equal to any, either domestic or foreign. Any shape or size made to order. Terms, 4 mos. from delivery of brick on board. Refer to

25,000 to 30,000 made weekly. 35

**THE NEWCASTLE MANUFACTURING** Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention. **ANDREW C. GRAY**, a45 President of the Newcastle Manuf. Co.

**RAILROAD IRON AND LOCOMOTIVE** Tyres imported to order and constantly on hand by **A. & G. RALSTON** Mar. 20th 4 South Front St., Philadelphia. 38th

**VALUABLE PROPERTY ON THE MILL Dam For Sale.** A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 68,497 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x32 ft. with lathes, work benches, Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, furnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45½ feet two stories high, with a shed part 45½x30 feet, containing a large air furnace, cupola, crane and corn oven.

Storehouse—a range of buildings for storage, etc., 200 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 30 feet wide.

For terms, apply to **HENRY ANDREWS, 48 State st.**, or to **CURTIS, LEAVENS & CO., 106 State st.**, Boston, or to **A. & G. RALSTON & Co., Philadelphia.** j245

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

**PASCAL IRON WORKS.**

**WELDED WROUGHT IRON TUBES**

From 4 inches to 4 in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T, L, and other fixtures to suit, fitted together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER Flues.

Manufactured and for sale by

**MORRIS, TASKER & MORRIS.** Warehouse S. E. Corner of Third & Walnut Streets, PHILADELPHIA.

**TO LOCOMOTIVE AND MARINE ENGINE BOILER BUILDERS.** Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufacture: and for sale by

**MORRIS TASKER & MORRIS,** Warehouse S. E. corner 3d and Walnut Sts., Philadelphia. 11f

**PATENT INDESTRUCTIBLE WATER** Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits. This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York.

**J. BALL & CO.**

## FURTHER ITEMS FROM ENGLISH PAPERS.

**Cost of Constructing Railways in France.**

The financial reports presented to the French government by the engineers charged with the construction of the three sections of railway in the centre of France, give the following estimate of the expense:—The section between Vierzon and the confluence of the Allier and the Loire, the length of which is 32,194 met., will cost 5,600,000 fr.; or 173,945 fr. per kilometre. The section from Vierzon to Chateauroux, of the length of 56,691 metres, will cost 8,260,000 fr., being 138,380 fr. per kilometre. The section from Chateauroux to Limoges, the length of which is 76,419 metres, will cost 15,000,000 fr., or 196,286 fr. per kilometre. These three sections will, therefore, cost 28,860,000 fr., including the compensation for ground, works of art, guard houses, etc.

**Consumption of Smoke.**—A patent has been obtained by Messrs. G. & W. Taylor, for an invention to be applied to all furnaces constructed in the ordinary manner with open ash pits, for effecting a more perfect combustion of the inflammable gases and unconsumed carbon. It consists, first, in the application of an exhausting and blowing apparatus; and secondly, in a peculiar distribution or arrangement of the smoke flues, so as to be adapted to the operation of such apparatus. A fan, or blower, is applied to the flue just before the entrance to the chimney, to arrest the smoke and unconsumed gases, and force them through a flue, leading therefrom, and opening on, to the dead plate at or near the front of the fire bars. By this means the whole is passed over the incandescent fuel, where it is consumed, instead of passing up the chimney unconsumed.

**Manufacture of Iron in America.**—In last week, one of the anthracite furnaces (of the three in blast) at Calasaqua, three miles north of this place, yielded the unprecedented quantity of 112 tons of the best pig iron metal in one week! They say they can do more, they expect to run as high as 130 tons in one week. We believe there is not another blast furnace in the United States that can equal it. This immense establishment has been in successful operation for several years, and is under the immediate control and superintendence of Mr. D. Thomas—(author of several papers in the *London Mining Journal*)—a gentleman of great and practical experience, and who has a knowledge of the manufacturing of iron, equal if not better than any other person in the United States. He is most indefatigable in his exertions in conducting these works. This establishment is in the full tide of prosperity, and must be one of the most profitable of the kind in the country. We hear nothing said of the new tariff retarding their progress.—*Lehigh Bulletin*.

**Crampton's Patent Locomotive.**—In former numbers of the *Mining Journal*, we have described and illustrated Mr. T. R. Crampton's patent engine; we learn, by the *Cumberland Packet*, of Tuesday, that an engine, on Mr. Crampton's principle, and built by Messrs. Tulk and Ley, left that day the iron works at Lowca, near Whitehaven, for its future

destination on one of the railways in Belgium. There is also a "monster engine" upon the same principle now in course of construction at Messrs. Tulk & Ley's establishment, destined for the London and Birmingham railway. These engines are both on the narrow gauge principle, with 8 feet driving wheels; and the superiority claimed for them is, that they combine the entire safety of the broad with all the velocity of the narrow gauge. The centre of gravity in these engines is much lower than in any others, and, consequently, the rocking and vibratory action is greatly reduced, as nearly its whole weight is confined between its supports. Either four, six, or eight wheels may be used on Mr. Crampton's engine without the slightest alteration in the working arrangements; and the advantages resulting from large wheels are secured by the gravity being wholly uninfluenced by the size of the driving wheel. Another advantage arising from Mr. Crampton's engine is, that from the position of the boiler, the heating surface may be increased to an extent of at least 2000 ft., if required, without injuriously affecting the centre of gravity; while the angle of stability is also much greater than upon other engines. With the engine now building for the London and Birmingham railway company, various experiments, calculated to prove the superiority of its principle, are intended to be tried, and we shall be happy to learn the result.

**New Era in Steam Navigation.**—We have before referred to the invention of Mr. Stephen R. Parkhurst, of New York, for which he has obtained patents in England, and other parts of Europe, and also in America. We have been shown, by a practical engineer, the design of a steam engine, invented also by this gentleman, the construction of which is so simple, so powerful, and so direct, that several engineers and machinists assert that it will supersede the present steam engines, both on land and water. For the turning of his steam ship propellers this engine is admirably adapted; its action is direct upon each shaft of the propeller, leaving the entire hold of the vessel free of the bulky machinery which now fills so much valuable space in steamers—the boilers and coal occupy but a small space of the hold of the ship. Several features will distinguish Mr. Parkhurst's "steam ship propeller and direct marine steam engine," among which, economy of time, of fuel, and other items, will form a large saving in the present expenditure of steam navigation. It is proposed to bring these important inventions immediately into operation in this country, for which a company is now forming, with a view of testing, upon a large and practical scale, their utility. In company, a few evenings since, with a party of nautical gentlemen of New York, Boston, and Philadelphia, it was asserted that, before long, steam ships would leave *Liverpool daily, running alternately to New York, Boston and Philadelphia!* And why not? There are now already, upon a rough calculation, at least from 300 to 400 vessels leaving *Liverpool annu-*

ally for the above-mentioned ports; and by the application of Mr. Parkhurst's inventions they can be readily converted into steam ships, at a comparatively small expense.—*Wilmer and Smith's European Times*.

**Labor to Make a Watch.**—Mr. Dent in a lecture delivered before the London Royal Institute, stated that a watch consists of 902 pieces, and that 40 trades, and probably 215 persons, are employed in making one of these little machines. The iron of which the balance wheel is formed is valued at something less than a farthing; this produces an ounce of steel worth 41 2d., which is drawn into 3250 yards of steel wire, and represents in the market £13 3s.; but still another process of hardening this—originally a farthing's worth of iron—renders it workable into 7650 balance springs, which will realize, at the common price of 2s. 6d. each, £956 5s., the effect of labor alone. Thus, the mere labor bestowed upon one farthing's worth of iron gives it the value of £956 5s. which is 918,000 times its original value.

**Best Iron for Gun Barrels.**—In order to make *stub iron*, old horse shoe nails, called "stubs," are collected, then packed closely together, and bound with an iron hoop, so as to form a ball about 10 or 12 inches in circumference, which, being put into a furnace, or forge, fire, and raised to a welding heat, is united by hammering and drawn out into bars of convenient length for the purposes intended. This method is adopted for the locks, furniture, and breechings of all best guns; and is, to a certain extent, practiced for barrels, though not so much as formerly, more expeditious methods being employed on a larger scale. And, the quantity that can be obtained in this country being not only inadequate to the demand, but inferior in quality, immense numbers of horse shoe nails are imported from France, Holland, Sweden, and other parts of the continent, in casks containing from 16 to 18 cwts. each. The most approved modern method of converting them into gun barrels (after carefully sorting and picking them, to see that no cast iron or impurities are mixed with them,) is, first to put about half a hundredweight into a large cast iron drum, or cylinder, crossed internally with iron bars, through the centre of which a shaft passes, which is connected by a strap with the steam engine, and the revolution of the drum actually polishes the nails by their friction against each other. They are then sifted, by which every particle of dust is removed.—The steel intended to be mixed with them is clipped, by means of large shears worked by the engine, into small pieces, corresponding in size to the stubs, and afterwards cleansed by a similar process. About 40 pounds are thrown on to the inclined hearth of an air furnace, where they are puddled, or mixed together, with a long iron rod, and withdrawn in a mass called a bloom, almost in a state of fusion, to be welded under a hammer of three tons weight, by which it is formed into a long square block. This, being put in at another door of the same air furnace, is raised to a bright red heat, and drawn out, under a tilt hammer of a ton and a half weight, into

bars of a proper size to pass the rollers, by means of which it is reduced to rods of the required size. The air furnace, having two doors, prevents any loss of time, as the moment one ball of stubs is withdrawn another charge is put in, and the two operations go on together, keeping both hammers employed. The iron thus produced is very tough, and free from specks or greys. But stubs are hardly ever used alone, as they were formerly, being too soft. Therefore, a portion of steel is mixed with them, which varies from one-eighth to one-half of the whole mass. It need hardly be remarked, that the advantage to be derived from the use of horse-shoe nails does not arise from any virtue in the horse's hoof, as some have imagined, but simply because good iron is, or ought to be, originally employed for the purpose. Otherwise nails would not drive into the hoof. And the iron being worked much more, is freed from its impurities, which can only be effected by repeated workings.—*Engines of War.*

**Progress of French Mining Industry.**—The St. Germain railway company is now causing to be covered in its immense station at Paris. Till now, passengers arriving and departing were exposed to all the severity of the weather, which was very disagreeable; and, besides, the carriages and locomotives sustained damage from being always exposed to the open air. This station serves as the head of the Rouen and Versailles railways, as well as of the St. Germain, and will shortly have to serve for the Havre line also. The vast structure now in course of erection is exclusively of iron, and appears to unite solidity with lightness and elegance. The covering of the roof will be in zinc. The great station of the Northern railway, at Paris, is also in iron; and it seems certain that all the *debarcaderos* of the railways that may hereafter run into the capital, will be in iron too. Iron, no doubt, is the best thing that could be employed for such a purpose; and notwithstanding its excessive dearth, will certainly turn out in the long run to be cheaper than any other material. The vast iron *debarcaderos* of the Northern and St. Germain railways, deserve to rank among the curiosities of Paris. They cast the long straggling one in wood of the Orleans line completely in the shade.

Most of the great iron establishments are devoting considerable sums to the purchase of flour and corn, which they sell to their workmen at less than the market price. The companies of Hayange, Blanz, the furnaces of the Loire and Ardeche are particularly quoted for their charity. Messrs. Talabot have adopted another system in their iron works—they induce their men to eat a good deal of meat, instead of subsisting entirely, or principally, upon mere vegetable diet as heretofore; and Messrs. Talabot hope, that after a few months' meat eating, their workmen will be as stout, strong, and laborious as those of England. It is ungracious to cast a reflection upon what seem charitable actions—but is not the sudden affection which the iron masters just now manifest towards their workmen, adopted as a nice little piece of clap-net

for the Chambers, when the iron monopoly shall be attacked?

One of the favorite topics in the declamation of the ironmasters, and their partisans, against any modification of the iniquitous protection they enjoy, is, that it would have the effect of driving 400,000 workmen out of employ. Now, the fact is, that the persons employed in the fabrication of iron in this country do not exceed, even if they come up to, 49,000. Supposing that the abolition of all protection would entirely ruin the iron trade, so small a number of individuals could easily find other kinds of employment. But there cannot be a more mistaken notion on earth, than to imagine that the doing away with an excessive and unjust protection would cause the ruin of the iron trade in this country. The great difficulty against which the ironmasters have to contend is scarcity of fuel, and dearness of conveyance. Of ore they have as much as they can require—more, indeed, than they can work. Give them, then, cheap coal, with cheap and rapid means of conveying their products to all parts of the country, and they have nothing to dread from foreign competition; so far from it, some well informed people even declare that with such advantages, foreign competition would have reason to dread them. Here is a proof of what French ironmasters can do with cheap fuel. In the northwestern group of iron mines, as it is called, iron ore is far from being so good, or so plentiful, as in the rest of France. Up to 1834-36, the production of iron in this group was very insignificant, owing to the heavy duties that existed on foreign coal; it was only 208,037 metrical quintals of cast iron, and 83,967 metrical quintals of forged iron. But almost immediately after the duties were lowered, the production increased to 291,061 metrical quintals of cast, and 137,768 metrical quintals of forged iron. Observe that the duties on coal were not abolished, but only reduced, the reduction still leaving them excessively high; and yet a mere reduction caused that great increase in the fabrication of iron in the most unfavorable district of all France. What would have been the consequences, had the duties on coal been abolished altogether? and what would be the consequence of a total abolition—not on the production of the worst iron district of France, but on that of the entire kingdom?

**Gt. Western Railway.—Tires of Wheels.**

—The Great Western railway company, in order to obviate all risks of future accidents, arising from broken tires, and not satisfied with the slender and uncertain security of the rivets recommended at the late coroner's inquest by Messrs. Braithwaite & McConnell, have been experimenting upon a wheel with a tire fitted upon a new principle; and which, having gone through the severe test of being cut in two, has been run at a high speed, and with a heavy load, without the smallest perceptible alteration of its position.—*Railway Chronicle.*

**Extraordinary speed on the Narrow Gauge.**

—Mr. Crampton's engine, the "Namur," constructed for the Namur and Liege company,

reached a speed of 75 miles per hour on Monday, the 22d March last, upon the short level of the portion of the London and Northwestern line between Euston square and Harrow. The rate of speed was noted by Capt. Codrington, who rode upon the engine. It is stated that the engine was perfectly steady at this high velocity. The "Namur" has been tested with "fast," "stopping," and "heavy" trains, and has always done her work much within the allowed time. The driving wheel of the "Namur" is seven feet in diameter.—We are informed that a very powerful engine on Mr. Crampton's principle of construction, and with eight feet driving wheels; will be brought upon the London and Northwestern line early in May next.—*Ibid.*

The catholic clergy of Rome have taken up the cause of railways; and a religious periodical of that city has, of late, devoted four columns to the subject.—*Id.*

**Speed on Railroads Considered in a Commercial Point of View.**

We find in the London Railway Chronicle, of March 6, a well written article on this subject, which we copy at length into the Journal—and for which we ask a careful perusal; it gives facts useful to those interested in, and having the management of, railroads in this country. We are just beginning to derive useful instruction from the working of the English roads, and we hope to profit by their experience.

Locomotive power is divided almost equally between the traction of passengers and of merchandize (including in the latter term live and dead stock.)

The further railways extend, the more important does the transport of agricultural, mining and manufacturing produce become.

Passenger traffic may be divided into express trains—mail trains—ordinary trains—parliamentary or third class trains.

Express trains afford passengers, from a few select stations, the highest rate of speed at a high price. For instance, the Great Western express, calling only at six stations throughout the 193½ miles, performs the distance between London and Exeter in four hours and a half; which, by the parliamentary train, calling at 39 stations, occupies 14 hours; and by the mail, calling at 20 stations, seven hours and a half.

Mail trains regulate the number of their halts by the number of post towns; while ordinary trains are presumed to be regulated by the requirements of the district traversed.

Parliamentary trains are bound to halt at every station between the two termini, and to maintain a speed of not less than 12 miles per hour.

An immense difference exists between the speed maintained on the various railways of this kingdom, even where the levels and curves are equally favorable, and the engines employed are constructed by the same maker.

In order to attain the highest rate of speed, of which a particular engine is capable, it is necessary to traverse a line as nearly level and straight as possible, with few halting stations and little cross traffic.

A rate of speed which would be quite safe in a thinly populated district, where the traf-

fic flowed in a parallel line to the railway, would be highly dangerous in a mining or manufacturing country, where roads and railways crossed frequently at right angles. The time lost in stopping and setting out again from numerous stations, amounts to many miles an hour. On several railways the numerous passengers gained from these halts are more profitable than those who would be willing to pay a higher fare to be conveyed without pause between the two termini.

On the Manchester and Leeds line, in 61 miles, there are, out of 28 stations, 12 which form the foci of thickly populated manufacturing districts, to and from which 35 passenger trains, of which 17 include third class carriages, ply daily; while on the Great Western, in the 72 miles between Reading and Bath, Didcot and Swindon are the only stations of any importance, and out of 44 trains, 4 only are open to third class passengers. It is obvious that it would be unprofitable, if it were possible, for the Manchester and Leeds to run trains at the speed used on the Great Western.

Presuming, for the purpose of comparison, that the construction and the nature of the traffic of any two lines is the same, it becomes necessary to ascertain whether speed beyond a certain limit does not cease to be remunerative.

There is no doubt that part of the cost of conveying merchandise is defrayed by passenger fares: coal and iron could not be conveyed at 1d. per ton per mile, unless first and second class passengers travelled by the same route. That is to say, the surplus which such a rate of carriage affords, after paying the actual expense of hauling a ton of coals, would not be sufficient to cover the fixed expenses of the railway—to pay the interest on the capital employed in its construction, etc.; and there are, in like manner, strong grounds for believing that ordinary trains defray more than their share of the expenses of express trains.

It is quite impossible to obtain authentic materials instituting an exact comparison of the cost of locomotion on various railroads, but it is worthy of remark, that since the rivalry between the gauges has led to the acceleration of express trains the pace of ordinary trains even on lines possessing gradients favorable for speed, has rather declined than advanced; and that the charges of the Great Western, which is distinguished for the celebrity of its express trains, exceed those of all the railways in the kingdom, by from 20 to 25 per cent. on passengers, and by from 30 to 500 per cent. on goods, which would lead to the conclusion that the speed of express train has been obtained at the expense of the speed as well as of the fares of ordinary trains.

In confirmation of this opinion, we extract from a Cheltenham paper the following tables, which show that while on an average of all the trains between London and Southampton the rate is 25.29 miles per hour; and on the London and North Western, between London and Birmingham, 24.26 miles per hour; the Great Western, between London and Bristol, only attains 23.97 miles per

hour. Between London and Wolverton the average is 26.92 miles per hour; while from London to Swindon the rate is only 24.97, being a difference of 2 miles per hour in favor of the narrow gauge line.

London and North Western.									
Miles.	Trains leaving Euston-square.	Time to Wolverton.	Time to Birmingham.	Rate of Miles per hour.	Average Time occupied.	Rate of Miles per hour.	Average Time occupied.	Rate of Miles per hour.	Average Time occupied.
61	6 15 7	1 57 3	4 36 7	26.92	1 57	24.26	1 57	26.92	1 57
112 1/2	6 15 7	1 57 3	4 36 7	24.26	1 57	26.92	1 57	24.26	1 57
South Western.									
Miles.	Trains leaving Nine Elms.	Time to Southampton.	Rate of Miles per hour.	Average Time occupied.	Rate of Miles per hour.	Average Time occupied.	Rate of Miles per hour.	Average Time occupied.	Rate of Miles per hour.
72	7 0 7	3 50 4	25.29	3 5	24.97	3 5	25.29	3 5	24.97
Great Western.									
Miles.	Trains leaving Paddington.	Time to Swindon.	Time to Bristol.	Rate of Miles per hour.	Average Time occupied.	Rate of Miles per hour.	Average Time occupied.	Rate of Miles per hour.	Average Time occupied.
77	6 0 6	3 20 5	4 0 9	24.97	3 5	23.97	3 5	24.97	3 5
118 1/2	6 0 6	3 20 5	4 0 9	23.97	3 5	24.97	3 5	23.97	3 5

The secret of this undeniable conclusion, so directly opposed to popular opinion, lies in the trains at 12.9 miles an hour, which are provided by the Great Western managers in compensating economy for those at 42 miles an hour.

It is thus that the many pay for the accommodation of the few. The M. P. flies by the express eagle, the countryman crawls by the parliamentary tortoise.

The manifest superiority of the Great Western express trains seems to be maintained under all the circumstances which we have laid down as requisite for the attainment of high speed.

First, favorable gradients; the prevailing gradient of the Great Western being 1 in 817 feet, while that of the London and North Western is 1 in 330, and of the South Western, 1 in 250.

Secondly, the absence of cross traffic.

Thirdly, high fares.

The Great Western charges the passengers to Exeter, for 193 1/2 miles (which is 20 miles farther than by the old coach road), by express, first class, 50s., second class 34s.; ordinary first class, 44s. 6s., second class, 30s.

The London and North Western to Warrington, 100 1/2 miles, by express, 42s.; ordinary first class, 33s. 6d., second class, 25s.—And the rates of the narrow gauge, South Western South Eastern, Eastern Counties and Norfolk lines are on the same scale.

The history of speed since 1845, is curious. In March, 1845, the South Western, Grand Junction, London and Brighton, Midland Counties and Great North of England had each from four to six trains daily, travelling at from 27 1/2 to 33 1/2 miles per hour. In March, 1846, the Great Western had advanced the speed of its express trains to 42 miles an hour, and of several ordinary trains to 27 1/2, while the before-mentioned narrow gauge lines had increased their number and speed of their express trains in like proportion, as will be seen by reference to tables published by Herbert Melville in the *Railway Chronicle* of 1846.

On examining the time-tables for 1847, we find that the Great Western express trains alone maintain the same rate. Ordinary trains have fallen from 27 1/2 to 26 miles an hour. Several narrow gauge lines have fallen off in like proportion, particularly the Eastern Counties, on which the goods traffic has increased 200 per cent.

The Edinburgh and Glasgow narrow gauge with gradients nearly as favorable as those of the Great Western, runs no express trains, and has reduced its speed from 27 1/2 to 26 3/4 miles, but then its fourth class maintains 20 1/2 miles an hour, making 13 halts in 46 miles.

Now an examination of the returns made to the Board of trade of the number of passengers of each class conveyed by the British railways for 12 months ending June 1845, would tend to show that in a national point of view, express trains are of infinitely less importance than moderate speed at lower fares.

On 61 railways the numbers stand—first class, 5,300,000; second class, 14,700,000; third class, 22,800,000. That is to say, the third class form 53.28 per cent; the second class, 34.34 per cent.; and the first class only 12.38 per cent. of the whole number conveyed. The second class passengers are invariably at least twice as numerous as first class, and even on railways where the third class trains form only one-tenth of the passenger trains, and travels at a rate under 14 miles an hour, the parties using them rival in numbers the first class.

For example, on the Great Western, there are 44 trains daily, of which 40 are devoted to first and second class passengers, and four only, that is to say, two between London and Bristol, and two between London and Exeter, are devoted exclusively to third class passengers, at 1d. per mile, and a speed under 12 miles an hour, and the proportions conveyed for the year quoted are—first class, 448,661; second class, 1,302,228 1/2; third class, 242,243 1/2.

As express trains are at least 20 per cent. dearer than the dearest ordinary trains, and are in no case more numerous than parliamentary trains, it is obvious that the number availing themselves even of the unrivalled Great Western express must be insignificant

compared with the second and third class passengers by ordinary and parliamentary trains.

But if we turn from those railways which merely afford third class passengers the accommodation enforced by parliament to those which, by numerous cheap trains at ordinary speed seek to develop local traffic—or to the Irish lines, which are exempt from all taxation, and where the third class fare is about a halfpenny a mile—we find the third class far outnumbering the first class.

For instance, on the—

	1st class.	2d class.	3d class.
Dublin and Drogheda...	29,386	216,903	320,221
Eastern Counties (Colchester line).....	92,635	266,190	110,736
Edinburgh and Glasgow..	89,987	178,636	581,406
Manchester & Birmingham.....	91,824	262,218	647,315
Manchester and Leeds.....	115,193	335,337	1,224,417
Midland.....	235,347	595,294	988,503

On all these lines, in proportion as local traffic has been developed, speed has been diminished. It has been found to pay better to promote the intercommunication of neighboring towns by frequent trains, at moderate fares, than to provide luxurious expresses for the wealthy few.

It is not a little curious to find that the third class passengers on an Irish line, 35 miles in length, are within 100,000 as numerous as the first class passengers; and by the same number more numerous than the third class passengers of the Great Western, which traverses and unites within 35 miles London, Slough, Maidenhead and Reading—within 13 miles, Bath and Bristol—and within 42 miles Bridgewater, Taunton and Exeter.—With such figures before our eyes, it is impossible not to conclude that much solid profit and utility has been sacrificed to the brilliant, costly, and exclusive express trains.

The case of the Great Western has been cited, because the advocates of the peculiar principle on which that railway has been constructed claim for it a decided superiority in speed and in economy.

The passenger traffic of the Great Western is greater, with one exception, than that of any other line in the kingdom. The charges are considerably higher than those of the London and North Western and the South Western. The gradients are more favorable by two to one. The express trains are faster, but the average speed is less than that of those two narrow gauge railways.

If the broad gauge really possessed the advantages which its advocates claim, the average speed of the Great Western ought to exceed the narrow gauge railways, and the fares ought to be lower.

All our experience tends to the conclusion that, whether on the broad or the narrow gauge, express speed is very expensive, not only in the wear and tear of the road and machinery, but in the neglect of local roadside, in favor of select terminal traffic.

As we find the local traffic of all railways largely increasing, while the speed of the ordinary trains of all railways has diminished, with the exception of the *show train* used by one-sixth of the customers of a company which bases its reputation on speed, it would seem

that we have reached the limits of profitable speed, especially as the railways lately sanctioned will not possess those admirable gradients on which alone extraordinary speed has ever been found practicable.

The number of persons to whom it is of importance to be conveyed at a speed exceeding 40 miles an hour for 100 miles, to or from the metropolis, must always be limited, and the electric telegraph will tend still more to limit them. But the number of persons and the quantity of goods which may be attracted by frequent trains at low fares, passing between adjacent towns, is incalculable.

In a word, in the present state of the country, cheap, punctual, frequent railway conveyance is to all men who live by labor—farmers, miners, manufacturers, learned professors and mechanics, an absolute necessity: an expensive express is a mere luxury. S.

#### Copper Trade.

It would seem, from the Mining Journal, that efforts are to be made in England to induce the government to reduce the duty on copper ores. Should it prove successful, it will benefit our countrymen now engaged in the copper business—and we hope it may.

The following is a copy of the petition presented to the House of Commons by Mr. Muntz, from the merchants and manufacturers of Birmingham, praying for the repeal of the duties on copper ores.

"Your petitioners are deeply interested in the continuance of the trade of importing copper ores into Great Britain from foreign parts, which trade has increased from 2550 tons of ore, which was the quantity imported in 1831, to 55,750 tons of ore, of the value of nearly £900,000, in the year ending 5th January, 1844, and which has been the means of securing to this country the manufacture and supply of full three-fourths of all the copper consumed in the world.

"In consequence of the duties first imposed by the tariff of 1842, on foreign copper ores imported into Great Britain, the trade in foreign copper ores to this country has been, and is likely further to be materially diminished. To prevent so great an injury, your petitioners pray your honorable House to repeal these duties, and they respectfully offer the following statements (which they are prepared to support by evidence) in support of their prayer.

"Chili, which produces abundance of copper ores, has, for many years, been an extensive consumer of British goods, but, not being a manufacturing country, possesses few means of repayment except by her copper ores.

"The British manufacturers and exporting merchants derive great advantage from the foreign copper ore trade, inasmuch as it forms a remittance for British manufactured goods sent to the countries from whence the ores are imported. The want of a return of this nature is felt seriously by the German, French and American merchants and manufacturers, and prevents their competition with the merchants of this country, severe as it actually is, from being as successful as it probably would be without the advantage possessed by the latter in the shipments of copper ores.

"The diminution, and probable destruction of this important branch of trade, is viewed with alarm by your petitioners, who are deeply interested in its maintenance; and to avert such an evil, they humbly pray your honorable House to repeal the duties on foreign copper ores imposed by the tariff of 1841.

B. COOK, Brass founder.  
STOCK & SHARP, Merchants,  
W. C. ALSTON, Manufacturer, etc."

#### The Rain Gauge.

When in England, a few years since, I saw the *Rain Gauge*, or *pluviometer*, in use. As some of our farmers may have the desire and the opportunity to amuse and instruct themselves in this way, I will give a particular notice of the instrument and its use. It is a contrivance for measuring the quantity of rain that falls. One of the best constructed rain gauges consists of a hollow tube having within it a cork ball attached to a wooden stem, which passes through a small opening at the top, on which is placed a large funnel. When this instrument is placed in the open air, in a free place, the rain that falls within the circumference of the funnel will run down into the tube and cause the cork to float; and the quantity of water in the tube may be seen by the height to which the stem of the float is raised. The stem of the float is so graduated, as to show by its divisions the number of perpendicular inches of water which fell on the surface of the earth since the last observation. After every observation, the cylinder must be emptied.

Another very simple rain gauge may be formed of a copper funnel, the area of the opening of which is exactly 10 square inches. Let this funnel be fixed in a bottle, and the quantity of rain caught is ascertained by multiplying the weight in ounces by 173, which gives the depth in inches and parts of an inch. In fixing these gauges care must be taken, that the rain may have free access to them; hence the tops of buildings are usually the best places, though some conceive that the nearer the rain gauge is placed to the ground the more rain it will collect.

Mountainous countries have most rain, and the reason seems to be, the winds driving the clouds against the rocks and hills, compress them in such a manner, that they are immediately dissolved, and fall as it were at once.

—Ohio Cultivator.

#### Philadelphia, Reading and Pottsville Telegraph Company.

The following gentlemen were elected officers of the Philadelphia, Reading and Pottsville Telegraph company, at a meeting of the Stockholders, held at Reading on the 20th ult.;

#### PRESIDENT.

M. S. Wekersham, Philadelphia.

#### DIRECTORS.

John Tucker, Philadelphia,  
H. H. Muhlenburg, Reading,  
G. A. Nicolls, Reading,  
Francis. W. Hughes, Pottsville.

#### TREASURER.

M. S. Richards, Reading.

#### SECRETARY.

J. Wood, (Operator,) at Philadelphia.

\* This idea is erroneous. It is the attraction of electricity from the clouds by the mountains, that produces the condensation of rain.—[Ed. Sci. Am.]

Correspondents will oblige us by sending in their communications by Tuesday morning at latest.

### AMERICAN RAILROAD JOURNAL.

Published by D. E. MINOR, 106 Chestnut St., Philadelphia.

Saturday, May 1, 1847.

#### Massachusetts Annual Reports.

We give, this week, another of the Massachusetts Annual Reports.

#### Ogdensburg Railroad.

The Boston Courier states that a spirited meeting, to promote the success of this railroad, was held on Tuesday evening, at the Tremont House. Patrick T. Jackson, Esq., was called to the chair, and Mr. Edmonds, of the firm of A. & A. Lawrence & Co., appointed Secretary. The meeting was addressed by Abbott Lawrence, S. H. Walley, T. P. Chandler, B. T. Reed, James Hayward, and E. H. Derby. The merits and advantages of the line were pointed out by the several speakers, and Messrs. Parish of Ogdensburg, Walley of Roxbury, Reed, Derby, and Edmonds of Boston, were appointed a committee to adopt preliminary measures to secure the construction of the railroad.

#### Luggage at Depots.

We find the following paragraph in relation to the distribution of baggage at depots, in the Railway Chronicle. This is a subject which deserves attention in this country as well as in England. Serious delays too often occur in the distribution of baggage at depots. Proper attention does not seem to have been given to this matter, by many of the managers of railroads.

"The Great Western has recently introduced some regulations in respect to passengers' luggage, tending to security and economy of time in claiming it at the end of the journey. In addition to the label showing the destination of the luggage, a ticket with the initial letter of the passenger's name is also pasted on it, and the luggage is sorted alphabetically, so that a passenger on his arrival has only to apply to a bin marked with the initial letter of his name."

#### The Funic Propeller.

Some of the English papers speak of a new propelling power, invented by a Mr. Gordon, and to which the above title is applied. The principle appears to consist in producing an expansion of air by heat, and forcing the same horizontally into the water at the stern of a boat. Mr. Gordon says he has succeeded in a boat 26 feet long, and 4½ broad—one man blowing a common small forge bellows, doing the work of two rowers. The bellows entered into a close furnace, luted, and fitted tight; and each stroke passed air through the close fire, the hot products rushing out against the water by a discharge pipe, immersed 12 inches. "The first blast by one man started the boat (weighing two tons,) from a state of rest, three feet in two seconds," the fire, and one man blowing air, doing the work of two men; hence it followed, that suitable close furnaces blown

by a 50 horse power steam engine, will do the work of 100 horses in impelling the vessel, and so on in proportion.

This statement may be correct, but we have no idea of the practicability of propelling large boats by this method.

#### Growth of the West.

The following eloquent allusion to the rapid growth and improvement in the Great West, is from the Cleveland Herald's report of General Cass' late lecture:

"General Cass remarked, that about fifty years ago he stood upon the summit of the Alleghenies, and looked out upon the unbroken wilderness extending over the vast area now occupied by the States of Ohio, Indiana, Illinois, Michigan and Wisconsin, and having a population of only 30,000. Now, five million of intelligent freemen are here pursuing the various avocations of honorable enterprise and industry. Then the glassy surfaces of our beautiful rivers were rippled only by the light canoe of the red man; now nine hundred floating palaces ride on the current of the great Father of Waters and his tributaries. Then the 'multitude marine' of our great lakes was comprised into one solitary vessel; now five hundred are scarcely equal to the demands of commerce on these inland seas. He, with his early lamented friend, General Harrison, had frequently met large numbers of the aboriginal possessors of the soil, in peaceful council, and on the battle field; now they have traversed the uttermost confines of civilization, and stand looking out upon the boundless Pacific.

"He had, when in Europe, spoken of the magnitude and suddenness of the improvements witnessed by the valley of the Mississippi, and they were received with great incredulity."

#### Paine's Marine Locomotive.

We notice accounts lately of a new plan and model lately turned out for steamboats, and which is to be adopted by government for a steam frigate, and is highly recommended as most suitable for the navigation of Long Island Sound. The following is the description given:

"The buckets or paddles are made fast on the cylinder, at an angle of fourteen degrees with its axis, and curve on the face of the cylinder, so as to prevent the lateral escape of water. They neither lift nor bury water, and their hold by actual experiment, is one-twentieth greater than that of the usual side wheels, and heavy or light freighted, they work without any adjustments. Mail steamers are to have duplicate engines, and no spars or other top hamper. Armed vessels, or a cruiser, are provided with spars, schooner rigged, and are constructed so that when a vessel is steaming against wind, they can be laid on the ship's upper work and lashed to their bearings.

"The mould of the vessel is that of an elliptic through the midship cross section, the longest axis being horizontal; this axis shortens as you approach the stem or stern, and as the elliptic figure is continued, and the perpendiculars remain the same, the axis at length shifts and becomes vertical continuing to diminish in its horizontal diameter, till it joins the stem or stern an acute wedge. The horizontal diameters are so shortened as to form an elliptic water line, when a line is passed along the bends or acute curve of the midship elliptics.

"The wheel is a light cylinder in the midships, and works against a column of water that rises up into the vessel's bottom, a little forward of the wheel, and passes aft."

From this description, we infer that the plan of

construction may claim some advantageous points; but that it will move through the water with less resistance than other models, is at least inconsistent with our theory, especially considering the immense resistance which must necessarily be occasioned by the rising up of the water into the bottom of vessel. Perhaps we may think better of the plan when we have a more perfect knowledge of it.

#### German Railways.

I copy the following, says Mr. Hagar, from Gallignani's Messenger:

"Railway communication is proceeding rapidly in Germany. Next year, the line will be complete between Cologne and the extreme frontier of the east, north and south of the Germanic Confederation. Vienna, Breslau, Berlin and Hamburg are now connected together by a continuous railway. The Augsburg Gazette informs us, that a meeting has been taken place between the directors of the different railway companies possessing this vast range of lines. Between Stettin and Vienna there is a distance of 225 French leagues, (562 English miles,) and between Vienna and Hamburg, 250 French leagues, (625 English miles). This is the greatest extent of continuous railway in one line. The various directors have agreed on an arrangement of departures in correspondence with each other, so that the distance between Vienna and Hamburg may be cleared in 49 hours, comprising stoppages; and between Vienna and Stettin, 40 hours. The trains leave Vienna at 7 o'clock P. M., and arrive at Breslau the next day at noon; it leaves Breslau at 4 o'clock P. M., and arrives at Berlin at 6 A. M.; it leaves again at 7 A. M. for Hamburg, and Stettin. The back train leaves Hamburg at 1 P. M., and Stettin at 4; it reaches Berlin at 9 o'clock at night, and leaves again at 11, and arrives at Breslau next day at 11 A. M., and Vienna the second day at 7 in the morning. The works in the southern line (from Vienna to Trieste) are rapidly progressing. When this line is finished, travellers may look themselves from Hamburg to Trieste!"

#### Baltimore Copper.

The Cleveland Herald alludes to the notice in the Baltimore American, not long since, of a quantity of pig copper, for manufacturing purposes, smelted at the Baltimore company's works, on the south side of that harbor. The Herald subjoins the following remarks:

"The ore from which this copper was obtained must have been brought either from Cuba or from the western coast of South America. If from Cuba, it was brought from the mines to navigable waters, from 20 to 40 miles, on the backs of mules, unless a proposed railway to the mines has been completed. This ore, we suppose, would yield about 20 per cent. of copper.

"If it came from South America, it was transported on mules about 100 miles from mines worked by men whose drinking water is carried in the same way 20 miles. We should in this country think these very serious obstacles to success in mining of any sort.

"On Lake Superior all the mines likely to be prosecuted are near the water, and we should suppose the products could be taken to Baltimore at much less cost than from Cuba even. The feasibility of smelting on the spot is however generally conceded, so that there will be no loss accruing by the transportation of useless matter.

"The mining business in the upper peninsula of Michigan bids fair before the lapse of many years to become of great importance, and, combined with the valuable fisheries of Lake Superior, will imperatively demand of the government the construction of a ship canal around the falls of Saut St. Mary. Let this be done, and the shipping interests on the other lakes would find a greatly enlarged demand

for the services of their 4 or 500 steamers or sailing vessels."

A railroad connection with Pittsburg, says the *American*, would give Baltimore access to this source of lucrative trade in the lake country. Pittsburg has her canal to Erie; she will soon have her railway connection with Cleveland. The resources of Lake Superior are just beginning to be touched. Her fisheries promise to be an exhaustless reservoir of wealth; her mineral treasures are immense.—Look at that gigantic system of Mediterranean seas which bound our northern frontier—consider the active energies of the population on their nearer border, the facilities of navigation, the productiveness of the adjacent regions, and, judging of the rapid, yet steady growth of prosperity which has already furnished from four to five hundred steamers and vessels of burden for the business of traffic, and some estimate may be formed of the future trade which is to crowd the cities and harbors of the great lakes.

#### Railroad Iron and Iron Manufacturers in Maine.

We learn from the Portland Advertiser that at the KATAHDON Iron Works—some 50 miles above Bangor—they have had one blast furnace in successful operation during the past winter, and are making about 50 tons of pig iron per week. This iron has acquired the very highest reputation among all the manufacturers of note in New England, and commands the highest price. The ore is a pure oxide—yielding, upon an average, over 50 per cent. of pig metal, and much of it is said to yield even 70 per cent.—equal to the richest ores of Cumberland, or those of Sweden and Russia. Some difficulty was at first encountered, and the furnace was entirely closed for want of knowledge of the quality of the ore, and a neglect to use the necessary argillaceous substance as a flux. By a series of experiments the quality of the ore has been tested, and the most admirable success has been the result, and a new furnace is soon to be put up.

We are informed, says the Advertiser, that the agent of the company was in this city a day or two since, with a view to contract with the Portland company for a supply of pig iron for their works, and that several tons of pig iron are to be forwarded to the company here as samples, for the purpose of being tested by them. This seems likely to open an extensive trade with Bangor, which will prove highly advantageous to both places.

At Bangor are to be found machine shops by far the most extensive in the State, for the manufacture of iron, including castings and heavy steam engines. The shops of Messrs. Hinckley & Egery and Franklin Mussey & Co., are both extensive establishments—and their engines enjoy the highest reputation.—The Bangor papers state that awhile ago a large engine from the shop of F. Mussey & Co. had been completed and put up at Lowell, Mass., for a steam saw mill.

The works of the Portland company will however be by far the most extensive establishment of the sort in Maine. We learn that this company have engaged the services of two of our most accomplished mechanics to superintend the erection of their buildings, which are to be built by the day, instead of by the job, and that a strong force is at work in preparing the foundations for building.

From the same paper we learn that the works at Pembroke, Washington county, heretofore engaged in rolling hoops of bar iron, have been fitted up for working railway bars, and that they are now turning 80 tons of rails per week, having been in operation about two weeks only.

This mill is now owned by Horace Gray & Co., of Boston, who are making rails also on the mill dam at Boston, and are said to be putting up another large mill at South Boston, to cover some 43,000 square feet, or an acre of ground.

Whoever will take the trouble to ascertain the quantity of railroad iron required in this country the present year, and the amount of the manufacture, will see that the demand must be beyond the supply. This will undoubtedly lead to considerable importations of railway bars the present and ensuing year. American iron is said to be worth from seven to ten dollars more per ton than the iron imported from Great Britain.

Experience has shown that the best quality of iron has been the most economical for railway uses in England, and there is a difference of from five to ten dollars in the price of the different qualities in the English market. The quotation prices for export are for the common or cheap iron. The manufacturers of railway iron in this country get orders readily for all they can turn out at about seven dollars per ton above the present cost of importation. This is owing to the superior quality of the iron.

#### Genesee Valley Canal.

This work, says the Rochester Democrat, has triumphantly vindicated itself. It was opened for business to Danville, 53 miles, seven years ago. The increase of tonnage during that time has been as follows:

1840.....	13,653	1844.....	65,070
1841.....	26,892	1845.....	75,586
1842.....	41,960	1846.....	87,615
1843.....	48,313		

The original opposers of this work pretended that all the freight destined to the Erie canal would have found its way to that channel had not the Genesee work been constructed. But the statement above proves the contrary. The principal article of trade is lumber, which could never have reached Rochester for shipment east, had not the Genesee canal been constructed—the land carriage being too expensive. Formerly the lumber in the region now traversed by the Genesee Valley canal, sought a market through the Allegheny river. It would have continued in that channel to this day, had not the canal been constructed.

The business now done upon the canal, as far as finished, exhibits a revenue to the State far beyond what its opponents predicted.

The tolls collected upon the Erie canal from produce which came to it from the Genesee Valley canal in 1846, amounted to.....\$126,733 52  
Erie tolls on goods for Genesee Valley canal..... 23,900 57  
Tolls collected on the Genesee Valley canal..... 23,173 93

Total.....\$173,108 02

Interest on its cost (\$1,450,365) at 5 per cent. 70,018

Repairs and Superintendence..... 15,776

85,784

The excess of receipts over expenses.....\$86,313

Some may object that we give to this canal all the tolls of the Erie, going and coming from it.—Then allow but half the tolls on the Erie to be credited to it, and there still remains an excess of over \$10,000. If the tolls on lumber alone are estimated: the tolls on merchandize and its own tolls, there still remains an excess of \$5,562.

None will doubt that the business done on the Genesee canal the second year after its completion was as much as would be the natural business it would

throw into the Erie, had it not been constructed.—If so, the wonderful increase created by its construction is so much to its credit with the Erie. In 1841, the tonnage was 26,892—in 1846, 87,615. The revenue from the tonnage for these two years, shows that the increase of the revenue of the Erie from the business of the

Genesee over that of 1841, amounts to.....\$103,921 30  
Add tolls on Genesee..... 23,448 57

Total revenue.....\$126,669 77

Deduct interest on the cost of finished part.....\$70,018 25

Repairs & superintendence. 17,614 90—87,633 46

Gained by the canal.....\$39,087 31

Figure it as you will, no other result than a profit to the State, instead of a heavy expense, can be made.

The bill now before the Assembly is to provide for its completion, by annual appropriations.

The sum proposed for the coming season is \$200,000

Materials now on hand..... 110,872

\$310,872

Great injustice has heretofore been done to the section of country to be benefited by this canal, but we hope for better treatment in future.

#### Navigation of the Lakes.

An act has just passed the Legislature of Michigan authorizing the construction of a ship canal around the Sault Ste. Marie, to connect the navigation of Lake Superior with that of the Lower Lakes.

The bill gives 500 feet right of way, and is said to be everything that the friends of the measure could desire. Upon this event, so auspicious to the interests of the northwest and of the Union generally, the Albany evening Journal remarks as follows:

"Individual enterprise will now accomplish what should have been done years ago by the general government. The business interests of the west have suffered greatly from the laggard movements of Congress. This canal will open to the commerce of the lower lakes a navigation of a thousand miles. The fisheries of Lake Superior will be rendered available, and facilities will be afforded to secure a prompt development of the great mineral wealth of this immense region. Now schooners and steamboats are borne over the rapids upon railways, at heavy cost and great risk. When this canal is constructed, an uninterrupted communication will be opened; and a steamboat may start from Quebec and move up to Lake Superior without an impediment. It is a disgrace to the national government that this important work was not sooner completed: but 'better late than never.'"

#### Locomotive Struck by Lightning.

On the 13th of March, a locomotive attached to the passenger train passing from Atlanta to Augusta, Ga., was struck by lightning. The fluid passed along the machinery of the engine to the cars, shaking some of the inmates pretty severely, but doing no damage. It is supposed that Mr. Townsend's horizontal smoke pipes may be so connected as to form a perfect protector of the cars from lightning.

#### Foreign Correspondence.

We published some time since, an extract from a letter written by Mr. E. Hedge, then in London—we now give another from the same source, which has been delayed for some time—but it will be followed by others from time to time as they may come to hand.

The table of receipts on the English railways, given herewith, exhibits an astonishing business—and from it we may anticipate more fully, what will be the result of our railway system in this country. We shall continue this table for several weeks, giving two weeks at a time—as long as we are furnished with the figures.

7 Howard St., Norfolk St. Strand,  
London, March 24, 1847.

DEAR SIR—I received per the ship Oxford, a file of the Railroad Journal for January, for which I am greatly obliged to you. It seemed while reading them, like looking some old friend in the face, and hearing him talk upon well known and familiar subjects. I see you still keep the railroad fever at a welding heat, and there appears to be great anxiety to carry through the great main lines at once.

That you may see something of the amount of money which now passes through the hands of the various railway companies here, I have copied the weekly receipts of a few of them—and will continue to copy and send them, if they will be of interest to you. It appears that on, say, 30 roads, and their branches, amounting to 2187½ miles, there is about \$30,000,000 a year received! How will this sum compare with the amount received by the proprietors of stage routes, the same distance, 20 years ago?—There are now completed and in use in this country, 97 roads and branches, and in course of completion 349; and applications before Parliament the present season for 300 more. I can find no book which gives the length in miles of the roads in course of completion, or those before the parliament at this time.—Most of the last, are quite short, as you will see by examining the map and explanation (just published) which I send by the same mail which takes this letter. I promised to send you a book containing a list of all the roads—their length—cost, &c.—but I find on examining it, that it is very imperfect—in fact wholly unsatisfactory, and would afford you no reliable information, if I were to send it. I send you also by this mail, a pamphlet just published by a gentleman with whom I have become acquainted, upon a new plan of propelling water craft, without the aid of steam, which he calls the "*Fumific Impeller*." It appears to be very nearly the same plan tried by Mr. Hall, an engineer formerly upon the Troy and Schenectady railroad, except that he directed the current of air directly through the bottom of the vessel, and thence caused it to pass toward the stern, confined in an inclined ways, that the buoyant quality of the air should by means of lifting the stern, cause the boat to move forward. Your friend R., with his partner Mr. Adams—who has recently obtained a patent for a new railway car spring—is manufacturing cars quite extensively a few miles out of town. I have not yet visited the establishment, though I intend to do so.

I have been here two months, and have secured all the patents necessary—have been introduced to some of the great railway managers and engineers: among them, Messrs. George Stephenson, Brunell, and Locke, who is now engaged on some of the continental works, I therefore hope to be able soon to say we have had a trial of the "cast rail," at least in England. Mr. Richardson, resident engineer on the Eastern Counties railway, has invited me to visit him at Hadleigh, to inspect a *skew bridge*, built of brick, a very long one, which crosses the stream at 30° skew—an angle hitherto never attempted. He says he believes it practicable to build *skew* bridges at almost any angle, as far as safety is concerned. If they can be built so as to be entirely safe, no doubt, in many instances, they will be the means of saving considerable expense, as streams and roads can be crossed wherever it is necessary, without regard to so locating a road as to pass them at right angles, or nearly so. I will write you per next steamer, and hope to have something of interest to communicate. Very respectfully,

Your obedient servant, E. HEDGE.

Removing Incrustation in Boilers.

A late number of the London Mining Journal, contains the following in relation to a mode recently made public, for removing the incrustation in steam boilers—an improvement well worthy the notice of those interested in the subject.

M. DEPOLAR—says the Journal—of Regent street, has just patented some improvements in preventing and removing incrustation in steam boilers, consisting of a compound, to be used, mixed with the water for the purpose of preventing the precipitate matters contained in it from incrusting the boiler.—The substances forming this compound are first, dry tannic or gallic extract, obtained from oak, gall-nuts, or any other substance yielding it; secondly, muriate of soda; third, hydrate of soda; and fourth, subcarbonate of potas. These ingredients are mixed in certain proportions, varying with the nature of the water (which is to be first analysed, to ascertain the quantity of precipitable matter contained in it), and also, according to the boiler, whether stationary or locomotive. For a stationary engine, the patentee recommends, for 336 hours' supply of fresh water per horse power, a compound of 12 ozs. of muriate, 2½ ozs. of hydrate of soda, 2 drachms of dry tannic or gallic extract, and half an ounce of subcarbonate of potas; but if salt water be mixed with the fresh water, or sea water be used in the boiler, then the muriate of soda is to be omitted, and 6 ozs. of hydrate of soda is to be used instead of 2½ ozs., and 5 drachms of tannic extract instead of 2. For locomotive engines running on the average of 140 miles per day, the patentee increases the above proportions about one-fifth. The patentee recommends the above compound to be added at intervals—viz: a portion every two or three days—in stationary engines it may be added to the boiler at once, and in marine engines it may be mixed with water in the boiler or in the feed tanks, but in locomotive engines it is better to mix it with the water in the tender. The patentee does not confine himself to the above proportions of the different ingredients; but what he claims is a

compound of fixed alkalis, with tannic or gallic extract, for the purpose of preventing incrustations in boilers.

Consumption of Smoke.

Among the many inventions for this purpose—and the numerous attempts which have so often been made to effect this most desirable object—the following invention, lately patented in England, is worthy of note. An exchange says that, a patent has been obtained by Mr. Lord, of Allerton, Chester, for an ingenious application of two furnaces or sets of fire-bars to one boiler, for steam engine or other purposes, whereby the gases from the fuel freshly applied to one grate pass over the incandescent coke on the other, and the entire carbonaceous matters are thereby consumed. The application of these is directed in such a manner, that the entire heat is applied to the whole boiler, although but one furnace is at a glowing heat. To effect this, the boiler is provided with a water space about the centre, extending across the upper half of the flue, and forming a bridge to direct the course of the smoke. The grates are moveable on rails; and when the fires are first about to be lighted, they are both brought towards the furnace doors, by which means all the dampers are open; when a clear red heat is obtained, one is pushed backwards to a certain point, and one set of dampers only kept open; a fresh supply of fuel, is then supplied to the other fire grate—the unconsumed carbon therefrom, passing under and through the clear fire of the first, is thoroughly decomposed, and the gases produced pass up the chimney. As soon as a bright red heat is obtained in the last fed fire, the same process is repeated with the other set of bars, and the operation has the same effect as before. There have been several modes invented of passing the unconsumed carbon of one fire over the incandescent fuel of another, but it strikes us at the moment that this appears the most ingenious, and likely to prove the most economical of any we have yet seen of this description of furnace for the consumption of smoke.

## CHARACTERISTICS OF ROAD.

Length of road	41-830 miles.
Length of single track	41-830 miles.
Length of double track	
Length of branches owned by the company, stating whether they have a single or double track	
Weight of rail per yard in main road	52 lbs.; about 3 miles
Weight of rail per yard in branch roads	of road, 66 lbs.
Maximum grade, with its length in main road	44-88 ft. length 2400 ft.
Maximum grade, with its length in branch roads	
Total rise and fall in main road	Rise 482,708, fall 391,458.
Total rise and fall in branch roads	
Shortest radius of curvature, with length of curve in main road	956 ft. for 400 ft in length.
Shortest radius of curvature, with length of curve in branch roads	
Total degrees of curvature in main road	685° 39' 54" 5".
Total degrees of curvature in branch roads	
Total length of straight line in main road	30-338 miles.
Total length of straight lines in branches	
Aggregate length of truss bridges	67 feet over road.
Whole length of road unfinished on both sides	About one mile.

## DOINGS DURING THE YEAR.

Miles run by passenger trains	96,759
Miles run by freight trains	13,370
Miles run by other trains	8,790
Total miles run	48,910

Number of passengers carried in the cars	59,389
Number of passengers carried one mile	
Number of tons of merchandize carried in the cars	5,357
Number of tons of merchandize carried one mile	
Number of passengers carried one mile, to and from other roads	
Number of tons carried one mile, to and from other roads	
Average rate of speed adopted for passenger trains, including stops	22 miles per hour.
Average rate of speed adopted for freight trains, including stops	15 miles per hour.
Estimated weight in tons of passenger trains, including engine and tender, but not including passengers, hauled one mile	
Estimated weight of merchandize trains, including engine and tender, but not including freight, hauled one mile	

## EXPENDITURES FOR WORKING THE ROAD.

For repairs of road, maintenance of way, exclusive of wooden truss bridges and renewals of iron	\$3,500 74
For repairs of truss bridges	
For renewals of iron, including laying down	
For wages of switch-men, gate-keepers and flag-men	
For removing ice and snow	
For repairs of fences, gates, houses for flag-men, gate-keepers, switch-men, tool-houses	
Total for maintenance of way	

## MOTIVE POWERS.

For repairs of locomotives	
For new locomotives to cover depreciation	
For repairs of passenger cars	
For new passenger cars to cover depreciation	
For repairs of merchandize cars	
For new merchandize cars to cover depreciation	
For repairs of gravel and other cars	
Total for maintenance of motive power	3,979 80

## MISCELLANEOUS.

For fuel and oil	5,375 70
For salaries, wages and incidental expenses, chargeable to passenger department	3,498 71
For salaries, wages and incidental expenses, chargeable to freight department	1,719 35
For gratuities and damages	
For taxes and insurance	
For ferries	
For repairs of station building, aqueducts, fixtures, furniture	
For interest	
For amount paid other companies in tolls for passengers and freight carried on their roads, specifying each company, (Taunton Branch, New Bedford and Taunton and Boston and Providence)	28,416 32
For amount paid steamer Perry, R. B. Kinsley, etc.	4,218 18
For amount salary to treasurer, superintendent	2,200 00
For amount paid miscellaneous exp. transportation	851 82
For amount paid other companies as rent for use of their roads, specifying each company	
For salaries of president, treasurer, superintendent, law expenses, office expenses of the above offices, and all other expenses not included in any of the foregoing items	

## INCOME DURING THE YEAR.

For Passengers:	
1. On the main road exclusively, including branch owned by company	3,790 09
2. To and from other roads, specifying what: [Taunton Branch railroad]	47,799 99
For Freight:	
1. On main road and branches owned by company	713 48
2. To and from other connecting roads: [Taunton Branch railroad]	10,902 50
U. S. mails, rents and express	983 06
Total income	64,119 19
Net earnings after deducting expenses	10,335 50

## DIVIDENDS.

Surplus last year	
Total surplus	

## ESTIMATED DEPRECIATION BEYOND RENEWALS, VIZ:

Road and bridges	
Buildings	
Engines and cars	

The foregoing is exclusive of the use of locomotives and cars for the construction of the road between Myricks and South Braintree.

All which is respectfully submitted.

Peter H. Pierce, Nahum Stetson, Caleb S. Holbrook, Richard Borden, Nathan Durfee, Royal Turner, Andrew Robeson, Jefferson Borden, C. C. Gilbert, David Anthony.

#### WHITEWATER VALLEY CANAL.

We mentioned yesterday the prospect of an early completion of the repairs on this work, and the probability that in the course of 70 or 80 days the Whitewater valley would again be open to Cincinnati. We learn since from the Connersville 'Spirit of the Valley,' that the Board of Directors have concluded an arrangement with Messrs R. Calvin & Co., by which the canal will be put in navigable order by the 10th of July next. This arrangement embraces that portion of the canal between Brookville and Lawrenceburg. The other portion of the line has been for some time under contract, and the repairs are in rapid progress.

Messrs. R. Calvin & Co. have already engaged a part of the assistance they will require, and will immediately commence active operations.

The only difficulty now is as to funds, the company have exhausted its resources in securing the repairs at other points. Something has been done in this city to overcome this difficulty, but much more is wanted:—The Connersville 'Valley,' and Brookville 'American' urge upon the farmers, millers, and others along the line, the duty of aiding all they can, and we trust their solicitations will be heeded. As shown by the following extract from the American, a loan of credit is all that is asked immediately; and those who have good crops in, will find this a very profitable loan to them, if they take into their calculations the difference in price which the produce will bring with the canal repaired and in operation, above what they will be able to obtain if the work remain in disuse. The American says:

"The company have procured some neat blank notes of the denomination of \$5. They are getting as many of these signed as possible by those interested in the canal. They are made payable to the canal company on the 1st day of January next. These are immediately endorsed by the secretary of the company, and paid out to contractors on the canal. By the credit of the individuals who sign them and the endorsement of the company, they will obtain good credit, and in this way the work will be done.

"The credit notes are receivable for water rents and tolls due the company. When they are paid a certificate is given to the individual for the amount, with six per cent. interest, pledging the canal and company for its redemption. This certificate will also be received for rents and tolls. In this way those who lend a helping hand in this hour of need, will lose nothing, nor will they have unprofitable company stock. They only lend their credit to the company in the first place, and receive in pay a certificate which will always be good for tolls, etc. It amounts in fact only to paying a little toll in advance

in order to repair the canal. Who will not do it? Without some aid of this kind, the canal cannot be repaired, nor can one wait for his neighbor, for all must do something. It is no trifle, and there must be unity of heart and purse to set things in motion."—*Cincinnati Gazette*.

#### ITEMS.

**Baltimore Railway Meeting.**—At a meeting of the stockholders of the Baltimore and Ohio railroad company, at Baltimore on Monday last, the following resolutions were adopted:

Resolved, By the stockholders of the Baltimore and Ohio railroad company, that this company deems a connection between Baltimore and Pittsburg by railroad desirable, if it can be obtained on reasonable terms.

Resolved, That this company cannot consent to look to Pittsburg as the only western terminus of its road.

Resolved, That this company will not consent to the making of its road to Pittsburg by the Northern or Cassellman's river route.

Resolved, That the whole subject be referred back to the Board of Directors of this company, with power to act according to their discretion.

Mr. McLane expressed his opinion that the connection with Pittsburg was matter of secondary importance, compared with the advantages to be derived from striking the Ohio, as far south as Parkersburg, Fishing Creek, or even Fish Creek. He also submitted a comparison of the cost of these several routes.

**Increase of the Coal Trade.**—The Mine Hill and Schuylkill Haven railroad has increased its tonnage largely up to April 10th, this year, over the corresponding period last year. This company is extending a branch of its road into the Swartara coal region, and otherwise enlarging and improving its capacities for a more extensive business during the summer and fall. Authority has been given to the company by the Legislature at its last session to run locomotive engines over the road. This, it is believed, will afford greater facilities to the operators, and considerably increase its business and tonnage.—It seems to us that the prospects of increased and increasing business in the region, is decidedly flattering at this time.—*Miners' Jour.*

**Transportation to the East.**—A Pittsburg letter in the Philadelphia American, says that the quantity of western produce in that city awaiting transportation to the east, by the Pennsylvania canal, is unparalleled. Among the items mentioned, are large accumulations of pork, and the quantity of whiskey destined for the east, is said to be a new feature in the trade.

**Galena and Chicago Railroad.**—Mr. Morgan, the engineer of this projected road, finds by survey, that it will be of easier grade than even that of the famous Reading railroad. Now that the Southern railroad of Michigan is to terminate at New Buffalo, it is intimated by the President of the Galena and Chicago company, that a negotiation will soon be opened with the Michigan company, to form a connection with it at an early day, and it is

probable that the survey may be commenced immediately by Mr. Morgan. Some desirable amendments to the charter of the Galena and Chicago company have been passed by the Legislature, settling all doubts as to the validity of the charter, and the hope is expressed by the President, that arrangements will be made for the commencement of the road the present year.

**The Railway Companies, west of Albany,** have declined taking any more freight. They have as much on hand as they possibly can transport before the opening of the canal. If they were permitted to carry freight throughout the year, they would make arrangements to increase the number of cars and locomotives.—*N. Y. Jour. Com.*

**Great Western Railroad, Canada.**—The work on the road which was commenced, and suspended on account of the agitation of the Oregon question, is now resumed, and it is believed by persons familiar with the subject, that the amount subscribed, \$5,000,000, and partly paid in, will far exceed the amount required to finish the work. The Niagara bridge, the commencement of which has been prolonged for the want of the Queen's ratification of the charter on the Canada side, has been commenced, and the stock to the amount of \$200,000 has been taken, which is supposed to be sufficient to complete the work. The next enterprise which is identified with the two former, is the completion of the Lockport and New Falls railroad to Rochester, the whole distance from Rochester to the Falls is 81 miles, according to the surveys, 26 miles of which road is built and in operation, and only a link of 55 miles remains unfinished, and about one-half of the stock for that portion of the road has already been taken, say \$400,000. When the western list is finished, it will be taken east, where the balance will be filled up. When the road is finished, it will complete a chain of railroad from Boston to a point in Canada, opposite Detroit, Michigan, and when the Hudson or Harlem road is finished to Albany, it will make a line from New York city to the same point via Niagara Falls and through Upper Canada.

**Manufacture of Glass in the United States.**—We present our readers with the following returns of the amount of various articles used in the manufacture of flint glass, in the 10 furnaces in operation, viz:—1,200,000 bush. American bituminous coal; 50,000 bushels of foreign do.; 4,500 tons of Anthracite coal; 8,000 cords of wood; 3,600 barrels of resin; 3,555 tons of siliceous sand; 956 tons of fire clay; 950 tons of iron; 20,400 lbs. of borax; 3,616,000 lbs. of Missouri lead; 2,875,000 lbs. of pearl ash; 272,000 lbs. of saltpetre; 1700 tons of straw; 47,500 staves; 270,000 hoops; 1,400,000 boards; 6,500 lbs. of magnesia; 22,500 lbs. of Arsenic; \$200,000 worth of brass, britannia and tin ware. It is computed to bring these various articles to the factories, the occasional use of 57,745 tons, is equal to the constant employment of 5,393 tons coastwise, lake and river shipping. The manufactured goods require nearly as much more to transport them to market.

making a total of about 10,000 tons consumed, lake and river shipping employed in the business constantly.—*N. Y. Farmer and Mechanic*.

**New York and Erie Railroad.**—We regret that so large a portion of the time of the Assembly should be consumed in a foolish attempt to change the location of the New York and Erie railroad. The work is progressing upon the route laid out by the commissioners, with considerable rapidity. A change would occasion a great loss, and perhaps prevent the construction of the work. We hope the House will make short work of this bone of contention. None but a few disappointed individuals care a farthing about the controversy; and it is wrong to take up so much time with so profitless a subject.—*N. Y. Paper*.

**Auburn and Rochester Railroad.**—The public will be gratified to know that the bill authorizing the Auburn and Rochester railroad company to borrow \$600,000 to reconstruct their track with a heavy rail, 56 lbs. to the yard, has passed the New York Senate. The present frail structure is quite insufficient for the business of the road. The accidents are numerous and vexatious—though few in comparison with other roads on the same line, owing to greater care in management.

**Iron Ropes.**—This is an age of improvement, if the many ingenious contrivances and the making use of new combinations of long known materials, may be called improvements. Thus, we have paper made of straw, and grass, and seaweed; feather beds made of husks of Indian corn, and of birch brooms; beaver hats made of silk plush; and ropes made of iron wire. We learn from an English paper called the Atmospheric Railway Gazette, that a rope has been manufactured at Andrews & Smith's iron and wire rope works, which is 3600 yards long, 3 inches in circumference, and weighs seven tons and

fifteen hundred weight. This is a large rope, and must be immensely strong. It is to be used on an inclined plane, near Bolton, England.—*Schaghtkill Journal*.

### BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

### MISSING NUMBERS

OF THE RAILROAD JOURNAL.

Subscribers, who wish to obtain Missing Numbers of Back Volumes of this Journal, will do well to apply immediately.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

**TO CONTRACTORS.—KENNEBEC AND PORTLAND RAILROAD.**—Proposals will be received at this office until the 15th of May, for the Grading and Masonry of 28 miles of this road, extending from North Yarmouth to Bowdoinham, and the Branch Road from Brunswick to Bath, including the masonry for the Bridges across the Androscoggin, New Meadows and Catherne Rivers. The line of road and the plans and profiles will be ready for examination on the 10th of May; after which time any information in relation to the work can be had at this office, or of the Resident Engineers on the line of the road.

Persons unknown to the officers of the company, must accompany their bids, with satisfactory evidence of their ability to execute the work.

The remainder of the line from Bowdoinham to Augusta, 31 miles, will be ready for contract about the 15th of June; of which due notice will be given.

GEORGE S. GREENE, Eng. K. & P. R. R.

### ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—

For sale or imported to order by the subscriber. These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, giller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,

75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.			HEMPEN ROPES.			CHAINS.			STRENGTH Tons.
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.		Weight per fathom.	Diameter of iron.		
	INCH.	LB. OZ.	INCH.	LB. OZ.		LB.	INCH.		
11	4	13 5	10	24 -		50	15-16		20
13	3	8 3	8	16 -		27	11-16		13
14	3	6 11	7	12 8		17	9-16		10
15	2	5 9	6	9 4		13	1-3		7
16	2	4 3	6	8 8		10	7-16		7

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion.

### RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER

having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 30 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,]

WILLIAM ROE, Supt of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed,] G. A. NICOLL,

Supt. Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the New Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,]

T. L. SMITH,

Jersey City, November 4, 1845.

N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed,]

JOHN LEACH,

Jamaica November 12, 1845.

1y19

Supt. Motive Power.

**RICH & CO'S IMPROVED PATENT SALAMANDER SAFES.**

Warranted free from dampness, as well as fire and thief proof.

Particular attention is invited to the following certificates, which speak for themselves:

**TEST No. 10.**

*Certificate from Mr. Silas C. Field, of Vicksburg, Mississippi.*

On the morning of the 14th ult., the store owned and occupied by me in this city, was, with its contents, entirely consumed by fire. My stock of goods consisted of oil, rosin, lard, pork, sugar, molasses, liquors, and other articles of a combustible nature, in the midst of which was one of Rich's Improved Patent Salamander Safes, which I purchased last October of Mr. Isaac Bridge, New Orleans, and which contained my books and papers. This safe was red hot, and did not cool sufficiently to be opened until 16 hours after it was taken from the ruins. At the expiration of that time it was unlocked, when its contents proved to be entirely uninjured, and not even discolored. I deem this test sufficient to show that the high reputation enjoyed by Rich's Safes is well merited.

S. C. FIELD.

**TEST No. 11.—Certificate.**

By the fire which occurred in this village on the 27th July last, our Law Office, together with many other buildings, was destroyed—we had in our office one of Rich's Improved Patent Salamander Safes, which, though heated red hot, preserved, without being the least damaged, many papers valuable to our clients—the envelopes of a few papers being slightly scorched. Some twenty-four hours after the fire, the Safe was removed, and so hot was it, that several hours were required for it to cool off. Our office was in the second story of a large brick building, all the wood used in construction of said house being *pick pine*. While the Safe was red hot, one of the walls tumbled in, and so injured the lock that it was necessary to break the door open. From this test, we feel no hesitancy in recommending "Rich's Patent Salamander Safe" as *entirely fire proof*.

GOREE & KING.

Marion, Ala., Sept. 15th, 1846.

*Still other Tests in the Great Fire of July 19, 1845.*

The undersigned purchased of A. S. Martin, No. 138½ Water street, one of Rich's Improved Patent Salamander Safes, which was in our store, No. 54 Exchange place. The store was entirely consumed in the great conflagration on the morning of the 19th inst. The safe was taken from the ruins 52 hours after, and on opening it, the books and papers were found entirely uninjured by fire, and only slightly wet—the leather on some of the books was parched by the extreme heat.

RICHARDS & CHONKITE.

Benton, Miss., December 27, 1845.

One of Rich's Improved Salamander Safes, which I purchased on the 21 of June last of A. S. Marvin, 138½ Water street, agent for the manufacturer, was exposed to the most intense heat during the late dreadful conflagration. The store which I occupied, No. 46 Broad street, was entirely consumed; the safe fell from the 2d story, about 15 feet, into the cellar, and remained there 14 hours, and when found, I am told, and from its appearance afterwards, should judge that it had been heated to a red heat. On opening it, the books and papers were found not to have been touched by fire. I deem this ordeal sufficient to confirm fully the reputation that Rich's safe has already obtained for preserving its contents against all hazards.

(Signed,)

WM. BLOODGOOD.

New York, 21st July, 1845.

Reference made to upwards of nine hundred and fifty merchants, cashiers, brokers, and officers of courts and counties, who have Rich's Safe's in use.

The above safes are finished in the neatest manner, and can be made to order at short notice, of any size and pattern, and fitted to contain plate, jewelry, etc. Prices from \$50 to \$500 each. For sale by

A. S. MARVIN, General Agent,  
138½ Water st., N. Y.

Also by Isaac Bridge 76 Magazine street, New Orleans.

Also by Lewis M Hatch, 120 Meeting street Charleston, S. C.

16 11

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

**TO THOSE INTERESTED IN** Railroads, Railroad Directors and Managers are respectfully invited to examine an improved SPARK ARRESTER, recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger and freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Buren, Engineer and Supt Hartford and New Haven Railroad; W. R. M'Kee, Supt Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Supt New Jersey Railroad Trans. Co.; J. Elliott, Supt Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Starnes, Supt Elizabeth town and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Supt Macon Railroad, Macon, Ga.; J. H. Cleveland, Supt Southern Railroad, Monroe, Mich.; M. F. Chittenden, Supt M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hineley & Drury, Boston, will be promptly executed. FRENCH & BAIRD.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

•• The letters in the figures refer to the article given in the Journal of June, 1844. ja45

**PATENT HAMMERED RAILROAD, SHIP**

and Boat Spikes. The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed.

JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y. The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merritt, New York; J. H. Whitney, do.; E. J. Eting, Philadelphia; Wm. E. Coffin & Co. Boston. ja45

**MACHINE WORKS OF ROGERS,**

Ketchum & Grosvenor, Patterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

**Railroad Work.**

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR,  
ja45 Paterson, N. J., or 60 Wall street, N. York.

**PATENT RAILROAD, SHIP AND BOAT**

Spikes. The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 2 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal iron merchants in Albany and Troy; J. I. Brower, 223 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

•• Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand. ja45

**SPRING STEEL FOR LOCOMOTIVES,**

Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1½ to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,

## DAVENPORT & BRIDGES'

### CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

#### ESTIMATE OF THE PROBABLE COST OF ONE MILE.

4,234 Timbers, 11 ft. long, 3 x 6 inches =	
68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	
4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs. at 4½ cts. =	101 25
Workmanship free of patent charge.	600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.

Civil Engineer and Patentee.

No. 277 South Tenth St., Philadelphia. 331

## FRANKLIN HOUSE,

No. 105 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,

D. K. MINOR.

## AMERICAN RAILROAD JOURNAL. Office at the FRANKLIN HOUSE, 105 Chestnut Street, PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in those undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS.—Five Dollars a year, in advance.

" " Pottsville	34	1.40 and 1.20		

Five minutes allowed at Reading; and three at other way stations.  
Passenger Depot in Philadelphia corner of Broad and Vine streets.

## LEXINGTON AND OHIO RAILROAD. Trains leave Lexington for Frankfort daily, at 5 o'clock a.m., and 2 p.m.

Trains leave Frankfort for Lexington daily, at 8 o'clock a.m. and 2 p.m. Distance, 28 miles. Fare \$1.25. On Sunday but one train, 5 o'clock a.m. from Lexington, and 2 o'clock p.m. from Frankfort. The winter arrangement (after 15th September to 15th March) is 6 o'clock a.m. from Lexington, and ma. 9. from Frankfort, other hours as above.

## BOSTON AND MAINE RAILROAD. Upper Route, to Portland and the East.

### SUMMER ARRANGEMENT, April 1, 1847.

PORTLAND TRAINS. Leave Boston at 7 A.M. and 2½ P.M. Leave Portland at 7½ A.M. and 3 P.M. GREAT FALLS TRAIN. Leave Boston at 5 P.M. Leave Great Falls at 6½ A.M.

HAVERHILL TRAINS. Leave Boston at 11½ A.M. and 6-20 P.M. Leave Haverhill at 6½ A.M. and 4½ P.M.

READING TRAINS. Leave Boston at 8½ A.M. and 8½ P.M. Leave Reading at 6 A.M. and 1½ P.M.

MEDFORD BRANCH TRAINS. Leave Boston at 7½, 11½ A.M., 2½, 5½, 7 P.M. Leave Medford at 6½, 8 A.M., 1½, 4½, 6 P.M. The Depot in Boston is on Haymarket Square.

Passengers are not allowed to carry Baggage above \$50 in value, and that personal, unless notice is given, and an extra amount paid, at the rate of the price of a Ticket for every \$500 additional value.

CHAS. MINOT, Super't.

## SUMMER ARRANGEMENT.—NEW YORK AND ERIE RAILROAD LINE, from April

1st until further notice, will run daily (Sundays excepted) between the city of New York and Middletown, Goshen, and intermediate places, as follows:

FOR PASSENGERS—Leave New York at 7 A.M. and 4 P.M. " Middletown at 6½ A.M. and 5½ P.M.

FARE REDUCED to \$1.25 to Middletown—way in proportion. Breakfast, supper and berths can be had on the steamboat.

FOR FREIGHT—Leave New York at 3 P.M. " Middletown at 12 M.

The names of the consignee and of the station where to be left, must be distinctly marked upon each article shipped. Freight not received after 3 P.M. in New York.

Apply to J. F. Clarkson, agent, at office corner of Duane and West sts. H. C. SEYMOUR, Sup't. March 25th, 1846.

Stages run daily from Middletown, on the arrival of the afternoon train, to Milford, Carbondale, Honesdale, Montrose, Towanda, Owego, and West; also to Monticello, Windsor, Binghamton, Ithaca, etc., etc. Agent on board.

## NORWICH AND WORCESTER RAILROAD. Summer Arrangement. Change of

Hours. Commencing on Wednesday, April 21, 1847.

Accommodation Trains, daily, (except Sunday.) Leave Norwich at 6 a.m., and 4½ p.m. Leave Worcester, at 6½ a.m., and 4½ p.m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston, and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 2½ p.m. train from Boston.

New York Train via Steamboat—Leave Norwich for Boston, every morning, except Monday, on the arrival of the steamboat from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 6½ p.m., daily, except Sunday, stopping at Danielsonville and Norwich.

Freight Trains daily each way, except Sunday.—Leave Norwich at 7, and Worcester at 6 30 a.m. Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are Less when paid for Tickets than when paid in the Cars. J. W. STOWELL, Sup't.

**LITTLE MIAMI RAILROAD—OPEN**  
TO SPRINGFIELD—Distance 83 miles—  
connecting at Xenia and Springfield with Messrs. Nell, Moore, & Co's, daily daylight lines of stages going east and north, to Columbus, Zanesville, Wheeling, Cleveland, and Sandusky City, via Urbana, Bellefontaine, Kenton, and the Mad river and lake Erie railroad, or Columbus, Delaware, and the Mansfield and Sandusky City railroad—forming, by these connections, the cheapest and most expeditious route to Buffalo, Niagara Falls, Rochester, Albany, New York, and Boston.

On and after Thursday, August 13, 1846, until further notice, a Passenger train will run as follows: Leave Cincinnati daily at 9 A. M., for Milford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Old Town, Yellow Springs, and Springfield.

Returning, will leave Springfield at 4 hours 35 minutes A. M. A line of Hacks runs in connection with the Cars, between Deerfield and Lebanon.

FARE—From Cincinnati to Lebanon...\$1 00  
" " " Xenia..... 1 50  
" " " Springfield... 2 00  
" " " Columbus... 4 00  
" " " Sandusky city 8 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company, on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at of a passage for every \$500 in value over that amount.

The 1 1/2 P. M. train from Cincinnati, and the 2 40 P. M. train from Xenia, will be discontinued on and after Monday, the 10th instant.

A freight train will run daily.  
W. H. CLEMENT, Sup't.

**BALTIMORE AND OHIO RAILROAD.**  
MAIN STEM. The Train carrying the Great Western Mail leaves Baltimore every morning at 7 1/2 and Cambridge at 8 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburgh and Hancock, connecting daily each way with the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Pittsburgh. Time of arrival at both Cumberland and Baltimore 5 1/2 P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pittsburgh \$10, and time about 32 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$12. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

**WASHINGTON BRANCH.**  
Daily trains at 9 A. M. and 5 P. M. and 12 at night from Baltimore and at 6 A. M. and 5 1/2 P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington, and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. \$13 1/2

**MANUFACTURE OF PATENT WIRE**  
Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by JOHN A. ROEBLING, Civil Engineer, Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition. 3v19ly

Store house—a range of buildings for storage, etc., 300 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x35 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to HENRY ANDREWS, 44 State st., or to CURTIS, LEAVENS & CO., 106 State st., Boston, or to A. & G. RALSTON & Co., Philadelphia. 245

**T**O RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.

PASCAL IRON WORKS.

**WELDED WROUGHT IRON TUBES**

From 4 inches to 1 1/2 ft calibre and 2 to 25 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T, L, and other fixtures to suit, fitted together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER PLANS.

Manufactured and for sale by

MORRIS, TASKER & MORRIS. Warehouse S. E. Corner of Third & Walnut Streets, PHILADELPHIA.

**T**O LOCOMOTIVE AND MARINE ENGINE Boiler Builders. Pascal Iron Works, Philadelphia. Welded Wrought Iron Pipes, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufacture: and for sale by

MORRIS TASKER & MORRIS, Warehouse S. E. corner 3d and Walnut Sts., Philadelphia. 117

**P**ATENT INDESTRUCTIBLE WATER Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits. This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York.

J. BALL & CO.

**Crampton's Locomotives.**

We have copied several brief notices, from the London journals, of Mr. Crampton's improved engines. We now give Mr. C's own statement, in relation to the "Namur," the only one yet completed. This may be considered official, as it was made to the "Society of Arts," on the 31st March; and it should be read by all who are directly interested in the improvement of this wonderful machine.

**Society of Arts.—March 31.**—Wm. Pole, Esq., F.R.S., Vice President, in the chair.—Mr. Crampton gave the following account of the performance of the large wheel narrow gauge engine, "Namur," on the London and Northwestern. The Society will doubtless recollect that I had the honor of receiving a gold medal from them last year for the invention of a new locomotive engine supposed to possess certain advantages; and as this society agreed with me before it was executed, I conceive them entitled to every information on the subject, in order that they may ascertain whether their judgment was correct.—We are all aware how extremely easy it is to give an opinion after trials, but not so before them. During the discussion last year, I professed to obtain the following advantages in a locomotive engine for the narrow gauge, viz: the rocking and vibrating action to be reduced by lowering its centre of gravity, and by confining nearly the whole weight between the supports: the centre of gravity not being influenced by the size of the driving wheel, the advantages resulting from large wheels are consequently secured; four, six or eight wheels may be used, the working arrangements remaining the same; from the superior or low position of the boiler, facilities are given for increasing the heating surface to an extent of at least 2000 feet, and the centre of gravity not injuriously affected thereby, whatever the size of driving wheel; that the arrangement of the machinery is such that the driver can at all times see it at work, and the repairs can be more easily done in consequence of the men not having to get under the engine for that purpose; that the driving wheel being behind the fire-box is in the best place to secure adhesion and steadiness. That the foregoing improvements can be obtained without necessarily altering the proportion found to give the best effect in ordinary engines; consequently every engineer can carry out his own proportion of parts, still keeping the principle of the machine. Having stated what I professed to do last year, I will endeavor to show that so far as I am able to judge, I have every reason to be satisfied with the result, and I do believe that had I not succeeded with the first engine, I should not have been condemned without another trial, as all practical men are aware that a first machine of any kind is rarely perfect. The "Namur" is a six wheeled engine, with the whole of the working parts outside:

Diameter of driving wheel,	Ft. In.
Do. supporting do.	3 9
Distance between centre of extreme wheels,	13
Diameter of cylinder,	16
Length of stroke,	20
No. of tubes,	182
Length of tubes,	11
Diameter of do. outside,	9

Length of fire box,	4 3
Breadth of do.,	3 5
Area of fire grate,	14 6
Surface in fire box,	63
Surface of tubes inside,	937
Total surface,	989

It should be observed that the total surface is less than in many engines on the London and Northwestern. This engine is one of two ordered by Mr. George Rennie for the directors of the Namur and Liege, Belgium, which gentlemen I have to thank for their kindness in allowing it to be tried before leaving the country, and I am happy in being able to state that they have expressed themselves perfectly satisfied. I am also indebted to the directors of the London and Northwestern for the opportunity afforded me of running their trains with the engine. I conceive it due to the manufacturers of the engine, Messrs. Tulk & Ley, of Whitehaven, to state that the workmanship of the engine is equal to anything I ever saw. With these remarks I will endeavor to show to what extent my views have been realized. The "Namur" has been completed about six or seven weeks, and has run a distance of about 2,300 miles, and in no instance has any vital part been disarranged, and only in one instance had we occasion to stop, which was in consequence of a pump joint giving way; and out of these 2300 miles about 1700 were run on the London and Northwestern with express, mail, first class, second class, third class, coke and goods trains—in fact every variety of train taken by other engines on the Northwestern, and only in one instance, before alluded to, did we not arrive before the time, varying from two to eleven minutes at each station, i.e., we gained time to that extent between each station, it being the custom to stop any train arriving at a station before the time stated in the bills. This performance I judge to be conclusive as regards its capabilities of doing all the work in a satisfactory manner on the London and Northwestern at the present time. A train of coke in trucks was taken from Camden Town to Wolverton weighing 80 tons exclusive of engine and tender. During this trip we reached a speed on a level, of 51 miles per hour. The time was taken by Mr. W. Harding. On another occasion, while taking the 12 noon train from London, weighing about 50 tons, exclusive of engine, we attained a speed of 62 miles per hour between Tring and Wolverton; on this occasion we arrived at Wolverton eleven minutes before the time. During these trips I have had a number of engineers and scientific men on the engine, and in no instance has a remark been made that the engine was unsteady; but I may say, in all cases they have stated the engine to be quite steady at a speed of 60 miles per hour. The most severe test an engine can be put to is when it has no train behind it. We tried an experiment of this kind, with Capt. Coddington, the inspector general of railways, and Capt. Simmonds his assistant, upon the engine, and arrived at a speed of 74 miles per hour, on a level, going round a curve between London and Harrow.

The speed was taken by Captain Cod-

dington, who expressed himself, as well as Capt. Simmonds, perfectly satisfied with its steadiness at that rate of speed. In fact, no person has ever been able to discover any difference in its motion, whether going at 20 or 75 miles per hour, so far as regards the internal motion of the engine, although attention has invariably be directed to ascertain it; the only difference being a greater lurch upon any inequality of the road, but any lurch given by this means subsided immediately upon passing the place causing it. This lurching in ordinary engines, with the centre of gravity high, and heavy overhanging weights, causes the engine to vibrate from one side of the rails to the other, in many cases to a frightful extent. I believe therefore that the evidence is sufficient to enable me to state that I have succeeded in producing a locomotive engine with large driving wheels and outside cylinders sustaining perfect steadiness at high speeds, or at 75 miles per hour. The second proposition, the centre of gravity, etc., I think is evidently correct, which may be easily seen by referring to the drawing, accompanied with the fact of an engine being at work upon the plan. The third proposition is also, I think, evident to all persons acquainted in the least with the subject. The fourth proposition can only be proved by the engine being made and at work, so that it may speak for itself. There is one thing certain, that an engine containing about 1000 feet of surface is nearly completed for the Northwestern, with 8 feet driving wheels, 18 in. cylinder, and 20 in. stroke, and 23 feet of fire box; the appearance of which is precisely the same as the "Namur." With respect to the power being increased to 2000 ft., that that will be a difficult matter to show in a paper of this kind; but I have not the least doubt of producing an engine on the narrow gauge with double that surface if required; in fact, I believe that an engine may be made for the narrow gauge of any conceivable dimensions; at the same time I do not believe that engines of such magnitude can be used practically on any gauge. The fifth proposition I conceive to be of the greatest importance; it will be seen that the whole of the eccentrics, valve, gear, and every other moving part can be reached from the foot plates, enabling the driver to oil the parts when required, as well as see whether all is going on correctly, and prevent a total derangement which might occur, when too late, with the machinery under the boiler; also when repairs are required, the difficulty of getting at the parts in ordinary engines necessarily keep the engine in the shop a longer time than would be required for the same repairs in my engine, where the men can stand to do all that is required. There is no part requiring attention inside the boiler. Sixth, the regulator ordinarily put inside the boiler, or in the smoke box, is so placed that a man can stand on the ground and do anything that may be required. The slide valve is also in the same position. I attach great importance to these points, for the following reasons:—that an engine requiring a certain amount of repair can be done in less time with the ma-

chinery in a convenient position, as in my engine, consequently a railway company may do their work with fewer engines. A more striking proof of the superiority of this is shown by the fact that superintendents will not crawl under a dirty engine to see whether the men have done their work properly. We cannot but expect that many things are improperly finished; but where a superintendent can walk round an engine and see all the machinery without trouble, the men cannot, if so disposed, neglect their work without being discovered. There is another very important point connected with this arrangement of the machinery being outside, and which I have seen exemplified, viz: that of cleaning the engine, which has to be done daily. The cleaners, instead of having to stoop and put themselves in all kinds of shapes as is required to clean ordinary engines, can stand to their work in mine. I have made some inquiries upon this point, and find that four men and two boys will clean my engine better in the same time than six men and two boys will clean the ordinary engines. These advantages may appear trifling at first sight, but when we take into consideration the vast outlay and railways for locomotive plant, anything tending to diminish it, as well as labor, may fairly be looked upon as a matter worthy of attention. Seventh, that the driving wheel being behind the fire box is the best place to secure adhesion and steadiness. There are many engineers who prefer the driving wheels in the centre, but I must confess it never appeared preferable to me. I attribute a great portion of the steadiness of the Namur to the fact of the driving wheel being behind the fire box, and for these reasons: an engine when running fast requires a certain amount of weight on the leading wheels to keep it to the rails, and the driving wheels still more weight for adhesion to prevent slipping;—these wheels, the leading and driving, being at the extremities of the machine, can have the maximum weight put on them with perfect safety, by taking the whole weight off the centre wheels; for instance, the Namur weighs about 22 tons when running; if we support the engine on the extreme wheels the drivers will have 13 tons and the leading wheels 9 tons, and by putting 4 tons on the centre wheels the drivers will have about 10½ tons and the leading wheels 7½ on them, which weight is required for the proper working of the engine. It will be I think evident that, in the event of the road being in bad order, neither the leading nor driving wheels will be acted upon injuriously by the centre wheels being a fulcrum, as the springs having only 4 tons on them, will easily yield; but we will suppose the driving wheels in the centre with 10½ tons on them, the leading 7½, and the trailing 4 tons, the result of inequalities before mentioned will have the effect of causing the engine to rock on the centre wheels, the springs of which being too rigid to yield. To make it more clear, suppose the trailing wheels without any weight on them, the result would be an overhanging of the boiler to an extent quite inadmissible; and any weight on the trailing short of

that on the centre wheels only diminishes the evil; but in placing the greatest weight on the trailing or hinder wheels, as in my engine, no such tendency exists. I come therefore to the conclusion, that an engine having the weight distributed as in the Namur, is correct in principle, which is fully borne out by the working of the engine. With regard to any proportion of parts being adapted to my engine, I can only observe that I shall feel great pleasure in carrying out any engineer's proportions on engines that they may require on this plan. To enter minutely into all our fancies in this respect, I fear would be far from interesting to the society. I beg further to observe that I shall be happy to furnish the society (if they desire it) with the detailed experiments both of the Namur and the larger engine now nearly finished for the London and Northwestern, which I hope to have completed before the end of this session. The care required in making experiments with respect to coke and water, and the various circumstances to be taken into consideration during such experiments, demand that statements respecting them should be very carefully made, particularly in a new engine. I have, in consequence, come to the conclusion of not making them until my whole attention can be devoted to the subject, and everything is in a proper state for so doing.

#### Iron Manufacture.

We commence, in this number, the publication of a pamphlet—"ON WALL'S IMPROVEMENTS IN THE MANUFACTURE OF METALS, by the Application of Voltaic Electricity." This pamphlet was published in London last year, and a copy of it sent to a gentleman of this city, through whose politeness we are permitted to re-publish it in the Journal for the benefit of our readers. We cannot introduce it in any language, it appears to us, so appropriate as that of the author in the form of a "preface," which is as follows, viz:

The novel and interesting process which forms the subject of the following pages, has been sometime before the public. Three years ago its claims were tested, and the experiments which then took place triumphantly established its efficiency, and proved it to be no idle pretension. Its non-adoption, therefore, may perhaps have been matter of surprise, for there has been no failure in any succeeding trial, nor any proof weakened. Prejudice has, it will be seen, done much, and that slow caution, so hostile to anything wearing the appearance of innovation, has operated prejudicially for a time, but its claims were too genuine to allow for a moment a doubt of its efficiency and importance. Matters however merely personal are seldom of consequence to interest the public, and transactions now bygone even in their consequences, it were useless as inopportune to discuss. The crisis is passed; the judgment formed on the merits of the discovery, remains unshaken, and applications for the use of it have again poured in upon the patentee. At such a juncture the appearance of the present pamphlet will be deemed not ill-timed. It will tend to strengthen this restored confidence, and hasten to society the possession of advantages which we hesitate not to maintain

are equal to any ever conferred on industry and art.

#### ELECTRO METALLURGY.

The application of electricity, as patented by Mr. Wall, in the manufacture of iron and other metals, is unquestionably a most interesting process. It forms an epoch in the annals of science, and is pregnant with results of the highest import. Its novelty, perhaps, may seem to require some introductory remarks, but the numerous trials to which it has been subjected during a period of four years, the details of which will be given hereafter, will prove more satisfactory than the most elaborate dissertations. However, a few remarks on the progress and present state of the iron trade will be necessary, in order to form a correct idea of the advantages to be derived from Mr. Wall's invention.

Sixty years ago the English bar iron was made by means of charcoal, to which, occasionally, was added coke in small quantities. The metal thus produced was hard, deficient in strength, and brittle, and required so much time to convert it from the cast state to malleable or pure iron, that the largest works turned out not more than twenty tons per week. A great change, however, was at hand.

About the year 1700, Mr. Cort invented the method called *puddling*: this operation consists in exposing the iron to the flame of pit-coal on the hearth of a reverberatory furnace, while it is diligently stirred about with rakes or paddles, a process at first much opposed both by masters and men, but now universally adopted. Mr. Cort further improved his process by previously melting the cast iron in contact with coke blown upon by bellows, an operation now known by the term *refining*. Cast iron thus operated upon, become, after being puddled, a strong cohesive metal, to which he gave density and nerve, by beating it under a huge hammer, worked by steam or other power. It was then reheated and rolled, and thus came out malleable iron, and probably superior to any now produced in this country. The improvements introduced by Mr. Cort soon attracted the attention of government; this metal was recommended for the use of the navy, and after severe trials, was found equal to the best Swedish iron.

But these advantages had not been long secured before a great falling off took place in the quality of the materials used; to such an extent as not only to neutralize the improvements of Mr. Cort, but to render the iron offered for use at the present day, inferior to the metal produced before his time.

The ores then used for making cast and bar iron, were principally brown and red *hematites*, with a small proportion of the *earthy* iron ores; minerals far purer than the *clay ironstones* of the coal formation, almost exclusively employed in the smelting furnaces at the present day. When we consider further, that the *crude nature* of the materials is aggravated by smelting them with raw coal, urged on by a hot blast, we cannot be surprised at the inferiority of the article now brought into the market.

In consequence of the increased demand for iron, the competing effort for increase in quantity, has almost excluded all regard for its quality. Hence, when iron is required for anchors, cables, etc., recourse is had to Sweden or Russia, from which countries upwards of 16,000 tons is annually imported.

The rapid rate at which the production of iron has increased in Great Britain, may be seen from the following statistical retrospect:

In 1740, our cast iron was made with charcoal fuel, and amounted to 17,356 tons.

In 1788, the product was 61,900 tons, of which 48,800 were made with coke.

In 1796, about 125,000 tons were made, and almost wholly with coke.

In 1806, the product was 250,000 tons.

In 1820, the amount was 400,000 tons.

In 1830, the product had become 677,147 tons.

In 1840, the product is stated at 1,396,400 tons.

The product may be estimated at the present time, at a million and a half tons, from which enormous quantity it would be difficult to select a specimen either of cast or bar iron, equal in quality to that made 55 years back.

But it is not by statistical tables, nor mere theoretical comparisons that we are to judge of the system under consideration. It is not a matter confined to the hall of the lecturer, or the laboratory of the experimentalist. It should be reviewed in its consequences, in connection with those fearful accidents so frequently occurring in different parts of the world; and which are to be attributed solely to the impure quality of the metal used in the machinery destroyed. It may be said—"every evil cures itself," if allowed time;—but who, having the least pretension to philanthropy, would hesitate, or countenance any delay, where the lives of thousands are at stake?

It is vain, however, to expect that iron-masters, intent only on out-stripping their rivals in quantity and cheapness of production will incur the trouble and cost of any considerable and expensive alteration in their establishments.

At such a juncture, when the demand for iron is so rapidly on the increase, the appearance of Mr. Wall's invention is most opportune, as it offers a simple and economical process for separating the crudities which contaminate our iron, and bringing it nearer to the pure, tenacious and ductile condition of the best marks of Swedish and Russian metal.

It is hardly necessary, in the present state of chemical knowledge, to allude to the discoveries of our illustrious countryman, Davy, but the analogy between his writings and Mr. Wall's process is obvious.\* A slight perusal of that philosopher's treatise on electrical phenomena, in the production of the metals potassium and sodium, from bodies previously regarded as elementary, by the

\* See Sir H. Davy's first Bakerian Lecture, "On some Chemical Agencies of Electricity," read to the Royal Society in 1806; for which, during the hottest period of French hostility, the great Napoleon prize was awarded its author, by the Institute of France.

action of voltaic electricity, would sufficiently illustrate Mr. Wall's principles.\*

It may, indeed, surprise anyone who is not aware of the unfortunate barrier which ignorance and prejudice have set up, and continue with obstinate blindness to maintain, between scientific research and the arts of life, that Davy's splendid discovery, above noticed, had not long ere now been applied to that chaos of conflicting elements which are associated on the hearths of our iron furnaces.—Here are found, huddled together in intimate combination, a multitude of substances, such as silicon, alumina, titanium, manganese, sulphur, arsenic, phosphorus, all more or less prejudicial to iron.† Now, if the most simple action by which the temperature of bodies is raised, evolves electricity, and the mere contact of two dissimilar metals induces electrical action, what must be the effect on a molten mass of the above discordant materials, with their electrical conditions, raised to the highest degree of excitement by the intense heat of a blast furnace?

A reference also might be made to the works of Prof. Faraday, a name great in the annals of science, and whose "Experimental Researches" are full of corroborative proofs of the principles under consideration. Other authorities might be cited, but the above great names are amply sufficient. We will, therefore, proceed to note down the experiments made by Mr. Wall, which will be more satisfactory than any proofs drawn from the analogous writings of others. For notwithstanding that its phenomena were observed by remote antiquity, although it is as widely diffused, as energetic in its character, and as important in the economy of the material universe as heat itself. Electricity is even yet imperfectly known; its properties are not yet accurately defined; it is a region, where, though many discoveries have been made, strange adventures will yet be met with, which may overturn, or at least materially change all received views. Consequently, where the whole structure of our knowledge is raised by active observation and experience, one fact is of more worth than a thousand arguments—one experiment stronger than a legion of theories.

"To arrive," says Mr. Wall, "at just conclusions in science, inquiry and proof are absolute requisites; for if the basis be not truth, disappointment is sure to follow. I have, therefore, felt more anxiety, and bestowed more exertion, in convincing myself of the practical results of my discovery, and its benefits to manufacturers, in the first instance, than I have troubled myself in convincing them or others since.

"The wonderful effects of electricity in

\* See second Bakerian Lecture, delivered on the 19th of November, 1807, entitled, "On some New Phenomena of Chemical Changes produced by electricity; particularly the decomposition of the fixed alkalies, and the exhibition of the new substances which constitute their bases: and on the general nature of alkaline bodies."

† Of these deteriorating compounds, silicon is that which is most largely introduced by the agency of the hot blast; no less than ten per cent. having been obtained from cast iron produced at a great Welsh establishment.

Sir H. Davy's experiments, and enlarged and improved upon since his time, convinced me of the practicability of my plan, and the results to be expected from a steady pursuit in its development. For this purpose I gave up all other matters on hand, and commenced my experiments about 5 years since, resolved to allow nothing to interfere so as to frustrate the object in view. It would, however, be tedious and uninteresting to give a minute description of the several experiments I made during a period of three years and a half, up to the autumn of 1843. From that date, my experiments, hitherto private and on a small scale, became public, and took place in the presence of men of honor and veracity, whose testimonies I have procured. The parties with whom my first engagements were made were well qualified for the purpose in hand; and their skepticism, if I may so term it, obliged me to show and explain everything, (often repeatedly,) which had even the remotest connection with the affair.

"On the occasion referred to, the iron was seen in London, first in the Welsh pig; then broken, melted, electrified, and recast into pigs of 150 pounds each. Then, without being lost sight of, it was conveyed, per rail, to Birmingham, where it was puddled, hammered, and rolled into bars and plates, in the presence of the above mentioned parties. It was in this state brought back to London, and the strength of the metal was tried at the great anchor forge of Messrs Brown and Lenox, Mill Wall. It was twisted, pierced, punched, hot and cold, as well as being made into chain, and subjected to the testing machine, where the power induced by leverage will snap the strongest chain cable in the British navy. Mr. Lenox, in person, superintended the testing, and furnished the following report:

*Iron Cable Manufactory, Mill Wall, }  
20th October, 1843. }*

3½ inch links, made of Mr. Wall's iron, broke with machine, having borne several strains as under:

	3 inch full, measuring 7½ inch long, at
10 tons elongated,	to 8½ inches.
12 "	8½ reduced bare ⅓
16 "	8½
17 "	8½
18 "	9 reduced full ⅓
21 "	9½

22 14 cwt. broke showing a good chain fibre. Best cable iron should bear test 19 tons in chain.

One bolt, 2 ft. long by ¾ inch full at

	Inches.
6 tons elongated,	to 24½ reduced bare ⅓
9 "	24½
10 "	25½
11 "	26½ reduced full ⅓

11½ broke, showing a similar fracture to the above. Reduced, at break, to ⅓ inch.

R. G. P. LENOX.

"The gentlemen who manufactured the specimens in Birmingham, were entire strangers, both personally, and to the objects we had in view. Indeed they were told that the metal to be operated upon was a speci-

men of foreign ore, reduced into metal, which we were desirous of having tested, without favor, as by their report they were to be guided in our speculations; so that under such circumstances, their conduct and report admit of no suspicion of unfair dealing."

After the metal was puddled, and rolled into bar, the following queries were sent by Mr. Wall to the parties in Birmingham:

"Mr. Wall presents his compliments to Mr. Sims, and is desirous to request answers to the following questions:

"First—Please state what process the metal sent you on the 15th inst., has undergone, and what may be its intrinsic value in comparison with metal from Staffordshire ore, undergoing a similar process?

"Second—State what percentage this specimen possesses over ordinary pig, and the purposes to which it can be applied?

"Third—Does Mr. Sims consider metal produced from such pigs, as that operated upon, a saving of any of the intermediate processes, and what number?

"Fourth—What might be the amount of saving to an establishment manufacturing such pig, and with all the knowledge and facilities of the Welch or Staffordshire manufacturing establishments?"

Birmingham, Oct. 14, 1843.

Answer to question the—

"First. The metal sent here on the 12th inst., has undergone processes 1 and 2, and the intrinsic value is about £8 per ton, present market price; and it is 20 per cent. better than either Welch or Staffordshire iron, undergoing a similar process.

"Second. This question is answered in the first, except that this metal may be applied to any purpose where best iron is required.

"Third. I consider metal by No. 2 process from such pig, equal to that manufactured by Nos. 3 and 4 processes of Staffordshire bar iron of the present day.

"Fourth. A company working from such metal as that sent here on the 12th instant, with the knowledge and facilities of the Staffordshire establishments, would effect an average saving of 30 per cent.

"THOMAS SIMS."

"I, the undersigned, do hereby certify, and agree with Mr. Sims in his report on this iron,

JOHN PENN,

Engineer and Foreman at Mr. Sims' Works for twelve years."

After such a trial, in which every point was so closely watched and so determinately contested, and where the results were so satisfactory, scepticism was at an end. Still, when these results were contemplated in their bearings on the various processes occurring in the manufacture of metals, a feeling of astonishment seemed to predominate. In order, therefore, to put an end to all doubts, and make conviction doubly sure, it was thought advisable that Mr. Wall should proceed to some of the large iron establishments in the north of England. Milton, near Sheffield, was the place chosen for this purpose.

Accordingly, on the 6th of May, 1844, Mr. Wall went hither, accompanied by an assistant, and by the kind permission of the proprietor, was immediately introduced to the iron works. The manager, Mr. Hawthorn, as honest and upright a man as ever was employed in the trade, afforded every assistance in his power. His principal was "a clear stage and no favor," and he determined by the most accurate experiments, to test the real value of the discovery.

Milton Iron Works, May 8, 1844.

"The first experiment consisted in passing a current of electricity through about thirty hundred weight of No. 2 pig iron, when melted and received into a crane ladle. This ladle was lined with fire clay, and fixed in a bed within a few feet of the tap hole, so that it might receive the fused metal in its hottest state. The battery, which was a Smee's of thirty-six pairs, five and half inches by three, and arranged on the quantity principle, was applied by attaching the wire of the positive pole to a rod inserted in the top, and a wire of the negative pole to a similar rod at the lower extremity of the ladle. The action in the battery cells was regular but not strong. The menstruum (acid and water) was then changed from 1.5 to 1.7 specific gravity on Knight's acidimetre. The action being thus increased, a strong and highly offensive gas was emitted from the cells. Twenty-five minutes from the first application of the battery, two-thirds of the metal had set, so that the ladle was obliged to be emptied, to prevent the whole mass becoming solid. The portion which still remained in a fluid state, was run into beds of sand preparatory to its being puddled. The residue had so firmly adhered to the two poles, as not to be separated by any ordinary means.

"May 9th. The metal which had yesterday undergone the electrifying process, was this day puddled in order to be compared with some metal in the ordinary or non-electrified state. The following is a table of the results:

Electrified Iron.		
Charge.		Loss.
No. 1	3½ cwt.	16 lb.
2	3¼	8
3	4	20
Non-electrified.		
Charge.		Loss.
1	3½	24
2	3¼	15
3	4	24

The only difference particularly observable between the two metals was, that the electrified appeared torn and fibrous at the fracture, indicating force of cohesion. Its carbon was of a darker hue, and the molecules presented themselves in the centre of the pig in large bright clusters, denoting the absence of sulphur, which usually covers the molecules in non-electrified metal with a dull lead like film. It puddled much the same as the ordinary metal, only thinner; but as a change took place, or when it began, as the workmen term it, to come to nature, it balled rapidly and soft. It was also noticed by the puddler, that it

stood the fire better than the ordinary metal, a remark soon after confirmed by what occurred in the next trial.

"May 9, P.M. The metal electrified this morning was weighed out in portions of twenty-one hundred each, and was puddled this afternoon and during the night. The results were an average loss of 1 cwt. 1 qr. 2 lb. per ton, an excess, when compared with the preceding experiment, but solely attributable to the gross and wilful negligence of the puddlers. This man, from a blind spirit of opposition, which he did not attempt to conceal, made use of every means within his reach to mar the success of the operation. Under pretence of some deficiency in his hammer, he kept some of the charges committed to his care one hour and twenty minutes after the metal had balled. But he was disappointed; as remarked before, it stood the fire well, for after being subjected to so severe a test, it actually came out in a better condition than the rest, although a loss of one-fifth was the consequence.

"Several other trials succeeded, all equally satisfactory. An account of all that had taken place was sent to Dr. Ure, in compliance with his request, by Mr. Hawthorne, the manager. In it he gives details of the whole proceedings; notes down the various phenomena which were observed during the experiments, and concludes by stating, that in his opinion, the process would effect a saving, in the manufacture of iron, of 35 per cent. The proprietor of the works, Mr. Graham, was so satisfied of the value and the efficiency of the invention, that he at once wrote to the party connected with Mr. Wall in the patent, to obtain a license for the use of it in his establishment. Specimens of the metal were taken to London, and there tested in every way calculated to convince the most prejudiced. Analyses were made by Dr. Ure, and other experienced chemists; and in their report, they place the metal, which is termed No. 2, if electrified, on a parallel with the best best. Besides, even in the merchant bar, formed of the ordinary metal, they found silicon, manganese, and arsenic; but scarcely a trace could be detected in the electrified metal, although manufactured from similar ores, and in every other respect, by the same process. It was observed, also, to roll better than the ordinary metal; to rid itself of its exquisitely fine cinder more easily; passing better through the rollers, and under the hammer; nor was there so much, by three per cent., of the peroxide of iron from the cinders left after balling."

To this last circumstance we shall again advert, when treating of the effect of electricity on the peroxide of iron.

(To be Continued.)

Branch Railroad.—It is stated that the Philadelphia, Wilmington and Baltimore railroad company, have it in contemplation to run a branch of their road from Wilmington to Newcastle, by which the chain of railroad communication will be complete from Pottsville to Newcastle, and the shipment of coal may be continued during the winter months.

Correspondents will oblige us by sending in their communications by Tuesday morning at latest.

AMERICAN RAILROAD JOURNAL.

Published by D. K. MINOR, 105 Chestnut St., Philadelphia.

Saturday, May 8, 1847.

Massachusetts Annual Reports.

We give, this week, another of the Massachusetts Annual Reports.

Bridges for Railroads.

The following communication is from one who is every way competent to judge of the merits of Mr. Whipple's works—both bridges and books. We shall examine and refer to the subject again.

For the American Railroad Journal.

The object of this communication is to invite the attention of the profession, and others, to a treatise upon the construction of bridges, lately published, from the pen of S. Whipple, Esq., C. E., of Utica, New York.

Mr. Whipple has given much time and attention to this important subject; and as he is a gentleman of high attainments, both scientific and practical, and warmly devoted to mechanical pursuits, his treatise is prepared in a very able manner, and will, I have no doubt, be productive of much good.

There is no branch of engineering so little understood by men of the profession, as that of the proper construction of bridges. This is evident from the diversity of plans adopted upon public works, which are as various almost as the works themselves—a state of things somewhat remarkable, as there cannot well be more than one best plan for bridges of the same dimensions and character, and which can only be accounted for by a want of that complete knowledge of the subject requisite for forming a correct judgment. This want, Mr. Whipple aims to supply, and he begins at the right place, viz: at the foundation, by stating clearly the principles which should govern, and thence proceeding to the application of those principles in the arrangement of plans suited to various circumstances.

To those at all conversant with the subject of bridges, it will be obvious that it is naturally divided into two parts—one portion in relation to suspension, and the other to truss bridges. The treatise of Mr. Whipple is confined almost exclusively to the latter. In his investigations, he supposes the truss or supporting frames to be composed either of wood, or of wood and iron combined, or of iron alone.

With respect to iron bridges his remarks are peculiarly valuable. His experiments have been made upon a sufficiently large scale, and the bridges he has built have stood a sufficient length of time to test their stability, and the correctness of the principles upon which they were constructed. It is now several years since the undersigned was invited by

\* Mr. Whipple is the inventor of the improved weigh lock, in use upon the enlarged Erie canal.—He is also the inventor of other valuable mechanical improvements.

him to examine his models and plans for iron bridges, and a close observation since of bridges constructed in accordance with those plans, and a knowledge of the tests to which they have been subjected, has produced the conviction that bridges of iron for railways will, in the majority of cases, be found the most economical and safe, and the best suited in all respects to the purposes intended.

Those who have not given much attention to this subject, will be surprised at the small difference in cost between a truss bridge constructed principally of timber, and one formed wholly of iron. The instances are not few where durable iron bridges could have been constructed at a first cost not greatly exceeding that of the perishable wooden ones which have been adopted. As it respects the ultimate cost, the difference in the instances referred to, would have been greatly in favor of the iron bridge. We do not, however, desire so much to find fault with what is past, as to see a better knowledge of the subject prevailing with those who have the charge of public works, that fewer mistakes may be made hereafter.

The treatise of Mr. Whipple is drawn up in that plain and concise manner which indicates a clear and accurate mind, imbued with a very thorough knowledge of the subject. It is a work highly creditable to the profession, and will do honor to it at home and abroad. His illustrations and application of mechanical principles are brought as much as possible within the comprehension of all. He promises, if his present treatise meets with sufficient encouragement, to follow it by another of a far more strictly practical character, giving full details of plans suited to different circumstances and localities. We trust he will be so far encouraged in his present effort, as to induce him to persevere until he has accomplished all that he proposes upon the subject on which he is engaged.

E. F. J.

"Great Western" Railroad.

We learn, from authority, that eight large corps of engineers have just been organized upon this route, and it is expected that the entire line will be ready for contract, as early as August next. The surveys for the projected railway from Rochester, to intersect the New York and Erie and the Blossburg railroads at Corning, have been completed.

The consummation of the "Great Western," and the road from Niagara Falls to Rochester, will complete the last links in the great chain from Lake Michigan to the pier heads of Boston Harbor.

Thayer's Truss Bridge.

This invention appears to be gaining high favor with the public. We are informed that another is in progress of construction, to cross the Delaware at Damascus, Pa., a few miles above the one heretofore noticed, and which from its extra length and strength is among the wonders of the age. The Damascus bridge is to consist of two spans of 250 feet each. The river is rapid at this place, and no bridge hitherto constructed has been able to withstand the force of the current and floating ice.

Legal Decision.

PHILIPS VS. NEW JERSEY RAILROAD COMPANY.

Philips was passing in a wagon, with a colored lad, along the road near Newark, parallel with and near the railway. He met the train, and at the moment of passing, the engineer let off steam, which frightened the horse, caused him to rear, and he fell into a ditch, dragging in the wagon and those in it, by means whereof the horse was drowned, and Philips and the boy were chilled and injured. He sued

to recover damages for the injury. The suit was fully tried before Judge Edmunds, in the New York Circuit Court, and a verdict rendered for plaintiff of \$225.

Boats on the New York Canals.

The Canal Department of the State of New York has a regulation requiring the enumeration of all the boats upon the Canals, at the closing of the season. The list furnished in November last (1846) gives the following, which may be useful for reference. We copy the account from a late number of the Rochester Democrat:

Kind of Boat.	No.	Tonnage, Average.	Value.
Packets.....	49	32	\$49,000
Line boats.....	477	65	477,000
Lake boats.....	588	65	588,000
Bull head boats.....	187	67	187,000
Scow boats not decked.....	683	54	730,000
" do decked.....	741	62	
	2725	62	2,013,000

The inventory taken in 1843 was the first attempt of the kind, which gave a total of 2126. A comparison of that year with the last shows the increase and decrease of each description of boats:

Kind of Boat.	1843.	1846.	Inc.	Dec.
Packets.....	40	49	9	...
Line boats.....	389	477	88	...
Lake boats.....	379	588	209	...
Bull head boats.....	118	187	187	...
Scow boats decked.....	327	741	414	...
" do not decked.....	873	683	...	190
	2,126	2,725	789	180

This exhibits an increase of 599 boats; or about 23 per cent.; while the number of tons passing thro' the canal in the same time has increased about 50 per cent., or from 1,513,439 in 1843, to 2,268,662 in 1846. The less proportionate number of boats to the large increase of business, is to be found in the continual increase of their size, as the following shows:

Kind of Boat.	1843.	1846.	Increase.
Packets.....	1,370	1,353	183
Line boats.....	21,082	30,797	9,715
Lake boats.....	23,665	38,017	14,152
Bull head boats.....	7,350	12,514	5,164
Scow boats decked.....	18,425	39,844	21,419
" do not decked.....	75,361	45,562	301
	117,453	168,287	50,834

The progressive increase in the tonnage of boats is more satisfactorily shown by the registered tonnage within the last three years:

New Boats.					
Tonnage.	Boats.	1844.	1845.	1846.	Boats.
180	...	...	...	...	1
120	...	...	...	...	2
110	...	...	...	...	3
100	...	...	1	1	3
90	3	1	4	6	...
85	1	...	1	7	12
80	3	9	13	100	103
75	14	33	60	186	214
70	175	124	107	123	479
65	295	94	54	96	530
60	526	71	33	9	690
55	256	15	4	1	212
50	467	13	5	3	255
45	153	1	2	1	87
40	147	...	...	3	69
35	33	1	1	...	14
30	34	11	1	2	27
25	10	3	...	4	4
20	8	...	3	3	11
15	3	1	...	...	6
10	4	...	1	2	3
5	...	...	4	...	...
2	...	...	3	...	...
		3,126	378	297	477
					2,725

It appears from the foregoing statement that the

ascertained number of boats 1st of January, 1844, was.....	2,126
Built and registered in 1844.....	378
" " 1845.....	297
" " 1846.....	477
	1,152

Making in all, without allowing for 'deaths'. 3,278  
But the actual ascertained number of boats on the 1st of January, 1846, was..... 2,725

Showing the diminution of boats to be..... 553

As the 1,152 new boats built and registered in the last three years, are of course still in existence, it necessarily follows that the diminution of 553, as above stated, since 1843, is from the oldest boats of the least tonnage. It is perhaps fair to assume that the 553 boats which have gone out of use since 1844 were of an average tonnage of 47 tons. The average tonnage of the new boats is 69 tons. The absolute addition to the tonnage of the canals in the last three years, consequent upon such increase in the number of large boats, and the diminution in the number of small boats may be stated as follows:

2,126 boats, being the total No. Jan. 1 '44,	115,185
Deduct—553 old boats gone out of use,	25,991

Leaving 1,573 old boats in use Jan. 1, '47,	89,194
Add, 1,152 new boats since Jan. 1, '44,	78,336

Making 2,725 boats, and a total tonnage 1st January, 1847, 167,530

This differs only 758 tons from the tonnage of all boats as ascertained by actual view and estimate as before stated, and is equal to an average annual addition in the last three years to the tonnage of the canals of 17,449 tons, 13 per cent. per annum, or 39 per cent. for the whole time. The average annual absolute addition of boats in the same time, after deducting those which have gone out of existence, is 200 per annum, equal to 9 per cent.

#### Ogdensburg and Boston Railroad.

Our citizens, says the *Rochester Democrat*, are more deeply interested in this road than they imagine.—The Bostonians, ever alive to their interests, are making strong efforts to secure a portion of the western trade. To effect this, they have left nothing undone. The magnificent project of uniting Boston with the St. Lawrence, by a railroad to Ogdensburg is likely to be carried immediately into effect. Experience has shown the citizens and capitalists of that place, that a railroad connecting with a great western thoroughfare, is to them a mint of money. Even the imperfect facilities of the Western railroad have been productive of vast benefits to the city.—The enterprise and perseverance displayed in the Ogdensburg project is a sure guarantee that this work will be completed with all convenient speed. They first opened a private subscription, and employed surveyors, who traversed the line and made reports, which showed that the thing could be done; they then set to work and obtained charters from N. York and Vermont—opened books—obtained subscriptions for two roads to Burlington—made arrangements to connect with the Canada thoroughfares, which will secure them a rich trade—and commenced the construction of the two roads, which are to terminate at Burlington—one of which runs by way of Lowell, Concord and Montpelier, and the other by Fitchburg, Keene and Rutland.

"From Burlington to Ogdensburg is 155 miles. The height to be overcome in passing from one place to the other is 1009 feet above Lake Champlain, and 859 above the point where the road terminates on the St. Lawrence. The grade from Ogdensburg to the summit is 26 feet to the mile, or 1 to 200, there being in the distance 1,195 feet ascending

and 296 feet descending. The summit is 2½ miles from the Canada line, and from this point to Lake Champlain there is no ascending grade, and the maximum of descent is 39 feet to the mile. This will favor the passage of heavily laden trains from the west. None of the curves exceed 5000 ft. The estimated cost of the whole road is \$2,229,379, or \$19,000 to the miles. The road will cross Lake Champlain at Rouse's Point, by a bridge 3,880 feet long, over a sheet of water 20 feet in depth. At the point of crossing it will be met by the road from Montreal. Boston capitalists have made large investments in real estate at Ogdensburg. One company has taken about a mile on the river for wharfing.

"There are several reasons why this road is important to Rochester. When completed, flour can be sent from our landing for 12½ cents per barrel to Ogdensburg, and thence to Boston for 37½ cents, making the cost from this city to Boston at about 50 cents. Perhaps 75 cents ought to be considered about the aggregate charges on a barrel of flour from the time it leaves the mills in Rochester till it is on shipboard in Boston. It is plain to see that this route will in the nature of things compete successfully with the Erie canal, which, in its present capacity, can carry only a portion of the freight seeking a market in the eastern seaports. Boston now exports 500,000 barrels of flour a year, and as soon as an avenue to the west is opened that quantity will be doubled.

"The construction of this road must necessarily increase our lake trade, and greatly augment the amount of shipping at this port."

#### Southwestern Railroad Convention.

The Macon Telegraph—speaking of the Convention which was proposed to be held at Americus on the 28th of April—says it has been postponed to the 18th of May. The object of deferring the meeting to that period, is to adapt the time, as far as practicable, to the convenience of the people of the Southwestern circuit—the courts of which circuit being in session, a number of influential citizens would not be able to give their attendance, on the day first named.

We are happy to learn that the people of the counties through which the contemplated road is to pass, are wide awake to their interests, and are arousing themselves in good earnest to the work.—They are the most interested and the most to be benefitted by the undertaking, and should not merely lend a helping hand, but take the lead, and by their example and zeal induce others to follow. The most cursory inspection of the map of southwestern Georgia, will satisfy any one of the expediency, nay, of the necessity of a communication that shall be certain, speedy and cheap, between that section of the State and the Atlantic markets. This is a progressive age and country. There is an emulous spirit for making money prevailing everywhere;—competition meets us on every side; and to be stationary in any department of business, is in fact to be retrograding. The cotton region of Georgia, as it has been appropriately called, can produce a better article of cotton, and larger and more certain crops, than any other part of the State; but what will their crops avail, if there is no outlet for them? The superiority in quality, and the excess in quantity, are more than counterbalanced by the advantages which superior enterprise and energy have given other less favored parts of the State.

It would be a profitable and interesting calculation, which may be made at some future time, to estimate the extra charges incurred upon shipments

of cotton down the Flint and Chattahoochee rivers, and thence by a circuitous, tardy and dangerous navigation around the Florida keys; or to estimate by approximation, the damage and loss sustained by the detention, sometimes for months, of cotton on those rivers, in consequence of their unnavigableness. The item of charges, which in the return of sales, is always an important consideration, our planting friends, should they ship their cotton, instead of selling it to the merchant, would be disposed to look upon as an extravagant extortion; and yet they alone pay it; for all incidental charges attached to the transportation of their cotton to market, such as freight, postage, insurance and interest, affects the first cost of the article.

As we have before urged, says the *Telegraph*—"there is every reason for, and none against, a vigorous and prompt support of this undertaking by the planters of southwestern Georgia. They will do it from choice. They will be forced to it by stern necessity, for if they expect remunerating profits which increasing competition is annually diminishing, they must open a direct communication with the Atlantic. Let the planters of Sumpter, Lee, Baker, Randolph and Stewart, set down and count the cost on a bale of cotton before it arrives at the port for shipment, incurred by high freights, extravagant rates of insurance, detention, loss of interest, etc., and contrast it with the expenses paid on inferior cotton by the planter of middle Georgia, who gets it to market in three or four days, and the difference in charges is what the planter of the cotton region of Georgia loses on his cotton."

#### Greenville and Charlotte Railroad.

The *Charleston Mercury*, in an article upon the subject of the probable completion of their projected roads, says a Georgia exchange, "speaks strongly in favor of adopting means for developing the internal resources of its own State; instead of competing with its neighbors, for the command of their internal trade; a rivalry, which though profitable at first, from incidental advantages, must eventually result in the triumphs of their own home interests, if the true Georgia feeling be not totally extinct.

"The annexed paragraph gives strong and conclusive reasons for the propriety of the former course in Carolina. It has always struck us as remarkable, continues the paper from which we quote, that the abundant produce of the upper districts of that State, should have been locked up so long from all communication with her seaport, by the want of any mode of transportation, while such a truly fraternal zeal has been manifested in directing the superfluities of upper Georgia from our own city—the natural outlet—to the city of Charleston.

"While in our verdant youth, such fostering care was duly appreciated; but the child has now grown old enough to take its own property into its own hands, and if we mistake not the signs of the times, will soon be able to convince her neighbor of the necessity of looking nearer home for the storage of her granaries, than the Cherokee counties, whose trade should be ours, from all motives of mutual interest and State pride; and must be—if our merchants only exert due energy and skill in developing the facilities which their position and advantages have placed in their hands. Why will not Georgia awake from her slumbers—rouse herself from the apathy into which she has been plunged, and contribute her resources to the building up of her own seaport, in preference to that of a neighboring State, who sneers at her short-sightedness while waxing fat upon her gifts? Both policy and State pride contribute to urge the adoption of a course so natu-

ral and so profitable to all sections alike. Our own sectional jealousies should not be allowed to impede our progress. They would be regarded as simply ridiculous, were not their efforts so fatal to our common prosperity. The Mercury says:

"The Cherokee county in Georgia, which we are now approaching, and which we have been so desirous of reaching, is from 367 to 400 miles from Charleston. The freight from the different stations within that limit varies on grain from 25 to 30 cts. per bushel, and on flour from \$1 30 to \$1 37½ per bbl. These productions from that quarter are likewise exposed to the detention and loss of breaking bulk at Augusta and tax across the bridge.

"The distance, and by a continuous and uninterrupted railroad from Charleston to Greenville, and to Charlotte, will not exceed 250 miles, and the rate of freight on grain may be fixed at 12½ cts. per bushel, and on flour from 75 to 80 cts. per bbl., being in favor of the Greenville and Charlotte route, over that to the Cherokee county in Georgia, on grain from 12½ to 17 cts. per bushel, and on flour from 45 to 57 cts. per bbl. The proportional reduction on freight or other articles, such as tobacco, potatoes, fruit and feathers, of which the interior of North Carolina is productive, will be no less advantageous."

#### Connellsville Railroad.

The Stockholders of the Pittsburg and Connellsville railroad company held a meeting on Tuesday afternoon, 27th ult., and passed resolutions setting forth that from the friendly disposition of the citizens of Baltimore, as evinced in the proceedings of their meeting of the 3d ult., the stockholders "are disposed to make one effort more to complete an arrangement with the Baltimore and Ohio railroad company." The whole subject is therefore referred back to the directors, with full power to act in relation to the whole matter. The meeting adjourned to meet on the 19th inst.

In connection with this subject, we see it stated that a committee of citizens, among them the Hon. Louis McLane, left Baltimore on Thursday for Wheeling, to endeavor to compromise with the citizens of that place the late law of the State of Virginia, granting the right of way to the Baltimore and Ohio railroad company, through that State.

#### Foreign Correspondence.

We have, again, the pleasure of a letter from Mr. Hedge, who has been for some time past in London. He has an opportunity of witnessing, to some extent, the operations—not only of the railway system in England, but also of those who are applicants for new—and, oftentimes, to those now in use, rival—lines; and, notwithstanding the constant demands of his own business upon his time, we hope to derive many useful and interesting facts from him. To the readers of the Journal, who have made his acquaintance, during the long period of his connection with it, we are quite sure it will be gratifying to learn that he is well, and in fair prospect of success in his present enterprise.

We continue his statement—showing the weekly receipts upon 33 railways. The amount is, as he remarks, "enormous"—almost incredible—yet such are the facts—and they may be looked upon as indicative of the future in this country.

He says, in his letter, dated "7 Howard Street, Norfolk Street Strand, London, March 30th, 1847—I sent you per ship Gladiator, February 6th, a letter and a map of the railways in operation, and those projected, and now before Parliament, which is said to be quite complete; they appear to be marked out in almost every direction, and when completed will enable a traveller to reach almost any point by rail, as John says. I do not exactly understand why it should necessarily be so much more expensive to

travel by rail in this country than it is with us, but still it is the fact that fares are double, at least, what they are in the United States; and the carriages are not to be compared with those used on most of the roads in the United States. I sent, as above, a table of weekly receipts on a few of the roads, which I have continued to collect; and send annexed the amount received on the same roads for the four weeks last past; it appears to me to be an enormous sum: how does it compare with the amount received on our roads? I have read with great interest the articles which appeared in the Journal of 20th and 27th Feb., upon the Great Central Railroad from Philadelphia to St. Louis. If a paper, as ably written, upon each of the great main lines throughout the country, could be obtained, and published in the Journal, in succession, it (the Journal) would—must—be sought by all the intelligent readers of the country, to guide them in a proper understanding of the great interest of the country, and it would be bestowing upon them a boon indeed, while at the same time it would be the means of insuring you, the ability to pay for, and thus secure the contributions, of a class of men eminently capable of communicating the results of years of experience and careful study, directed exclusively to the necessities of the different States, and the best means of developing and forwarding business: it would also stamp legibly upon the Journal, its value as the only paper in the United States to be relied upon, on the study now uppermost in the mind of the world. There has been sharp work in the railroad committee rooms this session of Parliament, every line and portion of a line, indeed every inch, meets with opposition from rival lines, and if everything pertaining to an application be not exactly according to the rules laid down, it is immediately thrown overboard, or, rather, out. I was listening the other day to an opposition to a Scotch branch line, when a friend who accompanied me, pointed out an eminent Scotch engineer, and said of him, that a certain company made proposals to him to take charge of the work, and desired his

terms, which in due time he communicated, and being considered quite too high, he was asked to reconsider, which he did—and added another £10,000!

"The shareholders of the Ulster, (Irish railroad, 25 miles long) have recently had a half-yearly meeting; the receipt for six months were, for passengers, £11,991, for goods, £6,996, total, £18,987; expenses, £7,468; leaving a net profit of £11,519 = \$55,759—out of which they paid a dividend of £1 per share. This road had but a single track up to 1st January, at which time a second track was opened, of a different gauge—the old one being 4 feet 8½ inches, and the new one 5 feet 3 inches—the Irish standard gauge. The passenger traffic is now confined to the new, and the goods to the old line. Resolutions were passed approving of the dividend, (of course,) and placing at the disposal of the directors £100 for charitable purposes, (very necessary and proper at this time)—and giving £30 to the Stewards of the Down corporation, to be run for at the next races!! I expect the latter portion of the proceedings is peculiar to 'Ireland and the Irish'—and its meaning I do not understand, but presume it must come under the head of 'business created by the opening of the Ulster railway.'

"I have been over a portion of the Great Western railway, and the South Western—have also been over the Croydon atmospheric, and examined it; it seems to work well—but it does not seem to be much in favor. They have recently opened two miles more, making seven miles in all. Mr. Samuda, the patentee, has recently met with quite a loss in the burning of his works at Blackwall. \* \*

"I do assure you it is a great pleasure to receive the Railroad Journal regularly. How the croakers must be disappointed in the more than entire success of the Reading road, as set forth in their recent report. To the few who have constantly predicted success, how gratifying—and to the poor consumers of coal, what a real blessing!!

"Your obedient servant,

"E. HEDGE."

## MASSACHUSETTS ANNUAL RAILROAD REPORTS.

## Return of the Fitchburg Railroad Company, under the Act of April 16, 1846.

Capital stock	\$1,763,400
*Increase of capital since last report	440,900
Capital paid in, per last report	1,322,500
Capital paid in since last report	599,075
Total amount of capital stock paid in, (including 25 per cent. on 3527 shares new stock, created June 25th, 1846)	1,851,575
Funded debt, per last report	None.
Funded debt paid since last report	None.
Funded debt, increase of, since last report	None.
Total present amount of funded debt	None.
Floating debt, per last report	97,306 25
Floating debt paid since last report	97,306 25
Floating debt, increase of since last report	None.
Total present amount of floating debt	" except reservations
Total present amount of funded and floating debt, (on contracts not completed.	
Average rate of interest per annum on do.	5 to 5 1/4 per cent.

## COST OF ROAD AND EQUIPMENT.

†For graduation and masonry, per last report	\$298,121 91
†For graduation and masonry, paid during the year	60,690 80
Total amount expended for graduation and masonry	\$358,813 71
For bridges, per last report	102,938 08
†For bridges, paid during the past year	43,175 16
Total amount expended for bridges	146,113 24
For superstructure, including iron, per last report	327,545 84
†For superstructure, including iron, paid during the past year	85,080 88
Total amount expended for superstructure, including iron	512,626 72
For stations, buildings and fixtures, as per last report	119,063 81
†For stations, buildings and fixtures, paid during the past year	41,441 93
Total amount expended for stations, buildings and fixtures	160,505 73
For land, land-damages and fences, per last report	336,088 24
†For land, land-damages and fences, paid during the past year	91,233 51
Total amount expended for land, land-damages and fences	427,321 83
For locomotives, per last report	66,245 14
†For locomotives, paid during the past year	13,900 00
Total amount expended for locomotives	79,445 14
For passenger and baggage cars, per last report	20,309 40
†For passenger and baggage cars, paid during the past year	10,650 00
Total amount expended for passenger and baggage cars	30,959 40
For merchandize cars, per last report	60,746 94
†For merchandize cars, paid during the past year	39,745 77
Total amount expended for merchandize cars	100,492 71
For engineering and other expenses, per last report	46,418 67
†For engineering and other expenses, paid during the past year	12,622 76
Total amount expended for engineering and other expenses	59,041 44
Total cost of road and equipment	\$1,875,318 92

## CHARACTERISTICS OF ROAD.

Length of road	49-343m. fm depot to depot.
Length of single track	" " "
Length of double track	5-113 miles.
Length of branches owned by the company, stating whether they have a single or double track.	11900 ft. single tk. to Fresh Pond a Spy ponds fm main road a 1275 feet below depot in Charlestown of double tk.
Weight of rail per yard in main road	56 lbs.
Weight of rail per yard in branch roads	56 lbs.
Maximum grade, with its length in main road.	40 ft. 5 1/2m. in the aggregate made up of 4 separate plains on dif. parts r'd.
Maximum grade, with its length in branch roads.	15 feet. 1866 feet long.
Total rise and fall in main road	739 1/2 ft. rise, 313 1/2 ft. fall.
Total rise and fall in branch roads	2-7 ft. rise, 5-6 ft. fall.
Shortest radius of curvature, with length of curve in main road.	818 feet and 500 feet long.
Shortest radius of curvature, with length of curve in branch roads	573 feet and 300 feet long.
Total degrees of curvature in main road	1694 1/2 deg.
Total degrees of curvature in branch roads	456 deg.
Total length of straight line in main road	34-67 miles.
Total length of straight lines in branches	3367 feet above depot in Charlestown, & 850 below do. leading to the wharves.
Aggregate length of truss bridges	454 feet.
Whole length of road unfinished on both sides	About 1 1/2 miles, and about 2 miles where the track is not entirely filled.

## DOINGS DURING THE YEAR.

Miles run by passenger trains	140,424 miles.
Miles run by freight trains	48,173 miles.
Miles run by other trains	11,715 miles.
Total miles run	200,312 miles.
Number of passengers carried in the cars	327,034 on road & branch.
Number of passengers carried one mile	5,961,872
Number of tons of merchandize carried in the cars	201,800
Number of tons of merchandize carried one mile	3,351,310
Number of passengers carried one mile, to and from other roads	187,515 from Lexington [and W. Cambridge]
Number of tons carried one mile, to and from other roads	5,491 do. do.
Average rate of speed adopted for passenger trains, including stops	30 miles per hour.
Average rate of speed adopted for freight trains, including stops	10 miles per hour.

Estimated weight in tons of passenger trains, including engine and tender, but not including passengers, hauled one mile 7,091,900 tons, as nearly as the same can be estimated, including baggage and milk carried on the passenger trains.

Estimated weight of merchandize trains, including engine and tender, but not including freight, hauled one mile 4,217,893 tons.

## EXPENDITURES FOR WORKING THE ROAD.

For repairs of road, maintenance of way, exclusive of wooden truss bridges and renewals of iron	\$10,371 52
For repairs of truss bridges	450 00
For renewals of iron, including laying down	
For wages of switch-men, gate-keepers and flag-men	5,763 82
For removing ice and snow	251 70
For repairs of fences, gates, houses for flag-men, gate-keepers, switch-men, tool-houses	704 25
Total for maintenance of way	\$17,440 29

## MOTIVE POWERS.

For repairs of locomotives	8,321 18
For new locomotives to cover depreciation	
For repairs of passenger cars	3,700 20
For new passenger cars to cover depreciation	
For repairs of merchandize cars	4,837 37
For new merchandize cars to cover depreciation	
For repairs of gravel and other cars	537 00
Total for maintenance of motive power	17,395 75

## MISCELLANEOUS.

For fuel and oil	28,905 51
For salaries, wages and incidental expenses, chargeable to passenger department	17,771 86
For salaries, wages and incidental expenses, chargeable to freight department	25,680 34
For gratuities and damages	543 56
For taxes and insurance	647 52
For ferries	
For repairs of station building, aqueducts, fixtures, furniture	516 14
For interest	
For amount paid other companies in tolls for passengers and freight carried on their roads, specifying each company	
For amount paid other companies as rent for use of their roads, specifying each company, [Lexington and West Cambridge Branch]	2,400 00
For salaries of president, treasurer, superintendent, law expenses, office expenses of the above offices, and all other expenses not included in any of the foregoing items	6,138 44
[The office expenses, except expenses of treasurer's office, are included in the expenses of freight and passenger departments.]	\$117,447 34

## INCOME DURING THE YEAR.

For Passengers:	
1. On the main road exclusively, including branch owned by company	125,118 12
2. To and from other roads, specifying what: [Lexington and West Cambridge Branch]	3,619 97
For Freight:	
1. On main road and branches owned by company	151,038 57
2. To and from other connecting roads: [Lexington and West Cambridge Branch]	767 43
U. S. mails, \$1,994. Rents, \$4,107 27	6,101 27
Total income, (from Jan. 1, '46 to Jan. 1, '47)	286,645 36
Net earnings after deducting expenses	169,197 95
[The dividends are made up Feb. 1st and Aug. 1st]	

## DIVIDENDS.

[Feb. 1, 1846, 5 per cent. on \$1,322,500]	\$66,125
[Aug. " " " " " 1,763,400]	88,170
	154,295 00
Surplus not divided, [including 5 mos. net earnings]	114,739 39
Surplus last year do.	99,836 37
Total surplus, do.	114,739 39

**ESTIMATED DEPRECIATION BEYOND RENEWALS, VIZ:**  
 Road and bridges, [nearly new, and we have not charged off anything to depreciation beyond renewals.]  
 Buildings, do. do.  
 Engines and cars, [under this head, we have charged off to depreciation, \$4,118 60, to Feb. 1, 1846.]

## NOTES.

\* 3526 shares were created June 25, 1846, in addition to the above, on which \$25 per share has been paid, amounting to \$88,175.

† The amount of interest paid stockholders while the road was constructing, \$60,165 93; and also the price paid the Charlestown Branch railroad company for their road, have been apportioned among the different items of cost of road and equipments. The Charlestown Branch road has been paid for during the past year.

‡ Including purchase of Charlestown branch railroad.

We have agreed with the Lexington and West Cambridge railroad company to furnish cars and engines, and man their road for one year from the 1st day of September last, paying them at the rate of four per cent. per annum on the cost of their road, being about \$180,000; they keeping the road and buildings in good repair during the year. A large part of the freight on our road, to wit, ice, wood, ship-timber and bricks, is neither loaded nor unloaded by us; hence that expense does not appear in our freight expenses, as it is paid by the owners.

We have to report the following accidents:

May 17, 1846, Mr. Otis Gregory, freight conductor, while changing a car out of the freight train at Concord, with a yoke of oxen, was thrown on to the track, and one of the wheels passed over his foot, from the effects of which he lost his life in about one week.

July 9th, our special train to Waltham came in collision with a horse and buggy, at a crossing in Waltham, and broke the buggy in pieces, but did not do any other damage of consequence.

July 13th, an Irishman was injured, at Concord, by attempting to get on to the cars after they had left the depot.

Nov.—, Mr. Fowle, of Shirley, was injured, at South Acton. By mistake, he had taken his seat in the up instead of the down train; when he discovered his mistake, the down train was in motion, and in attempting to get on to it, he fell, and the car wheel passed over his arm. He has since nearly recovered.

Also, in November, the special train came in collision with a wagon, owned and driven by Mr. Brooks, of Lincoln, and killed his horse.

In neither of the above cases can the accident be imputed to a want of care and attention on the part of the company's agents.

In November last, our 11 o'clock train for Fitchburg, came in collision with some freight cars at one of the brick yards, near Fresh pond meadows, which were run out on to the main track by a mistake on the part of the owners of the yard; owing to a northerly wind, which blew the smoke and steam from the brick kilns across the track, the cars were not discovered in season to stop the train before it struck them. The engineer and fireman were slightly injured, but no other damage done, excepting to the engine and cars, which have been since repaired.

In accordance with the terms of the act of incorporation in the charter, the Lancaster and Sterling branch railroad has become vested in this company. We have made several surveys on the line of the same, but, as yet, have done nothing further towards its construction. We have located the Watertown branch railroad to Watertown village, and expended, in its construction, the sum of \$30,750 27. We are not yet prepared to report the different items of cost on the same, nor the characteristics of the road.

All which is respectfully submitted by

Jacob Forster, Horatio Adams, David Loring, Henry Timmins, Abel Phelps, Elias H. Derby, N. F. Cunningham—*Directors.*

## The Gauges.

We take the following comparative statement from the Railway Record of 27th March.

Average speed of 12 daily trains now running on the London and Birmingham, and Great Western, from Euston square to Birmingham, and from Paddington to Bristol; showing the present relative speed of the broad and narrow gauge, by the practical working of the two lines, and the real day's work done for the public. The advantage is 1½ miles per hour ONLY in favor of the Great Western; not sufficient mechanical superiority to compensate for the numerous breaks of gauge, which must result if the broad gauge extends to the north.

## GREAT WESTERN.

Leave Paddington.	Arrive at Bristol.	Time on the road.		
		h.	m.	Stop.
6 0	10 0	4	0	12
6 30	3 40	9	10	26
7 30	12 18	4	48	16
9 45	12 28	3	43	3
10 15	2 35	4	20	9
10 30	7 30	9	0	26
12 0	4 25	4	25	9
1 0	5 30	4	30	15
2 0	6 25	4	25	11
4 45	9 35	4	50	17
5 30	8 15	4	45	4
8 55	1 15	4	20	11
		59	16	159

118 miles. Average speed of 12 trains, 24 miles an hour.

## LONDON AND BIRMINGHAM.

Leave Euston square.	Arrive at Birmingham.	Time on the road.		
		h.	m.	Stop.
7 0	2 40	7	40	22
6 15	10 50	4	35	9
7 30	12 35	5	5	18
8 30	12 45	4	15	5
10 0	1 25	3	25	4
11 0	3 35	4	35	10
12 30	5 35	6	5	16
2 45	7 25	4	30	8
5 0	8 0	3	0	2
5 30	10 0	4	30	10
8 45	1 5	3	40	6
Add another 3d class train to make 12. The Great Western have two.		7	40	23
		59	0	133

112 miles. Average speed of 12 trains, 22½ miles an hour.

## ITEMS.

**Damages for the death of a Railroad Passenger.**—We understand that Doctor Alfred Hitchcock, of Ashby, brother of the late Dr. Henry D. Hitchcock, of Middleboro', who was killed on the 23d of February last, by a collision of cars on the Fall River railroad, has made an adjustment of the claims of the widow and heirs against said company. The company, through their treasurer, David Anthony, Esq., of Fall River, has paid to the legal claimants the sum of \$4500, and have received a discharge from any further liability.—*Boston Journal.*

**Connecticut and Passumpsic Rivers Railroad.**—We are pleased to hear of the success of this corporation in obtaining means to forward the building of their road. In another column will be found an advertisement for contracts to complete the grading and masonry of 34 miles of its extent, to be bid for by sections, the plans for which may be seen at the office of the company.—*Boston Courier.*

**Northern N. H. Road.**—The indications are that this road will be completed within the time named, say in November, or thereabouts. The work is about to be commenced on the bridge across the Connecticut, to join the Northern and Central roads, and it is expected it will be done in September.

**Vermont Central.**—The tendency of this road is upward and onward; we expect to see the iron horse upon a part of the road by the 1st of January next. The annual meeting of the stockholders, and also a meeting of the directors, will be holden in this village on the 4th of June.—*Montpelier Watchman.*

**Ogdensburg Railroad.**—We understand that the directors of the Ogdensburg railroad, at their recent meeting, voted to pay 7 per cent. interest on moneys paid in by stockholders, until the road is completed and in operation.

**Portsmouth and Concord Railroad.**—The ground was broken on the first section of this railroad, at the Portsmouth Plains, on Monday morning. Remarks were made on the occasion by A. W. Haven, President of the company, Samuel Cushman and A. Ladd.—Messrs. Belknap & Co. are the contractors.

**Boston, Concord and Montreal Railroad.**—This enterprise, the success of which is demanded by the imperious necessity of people living in the very important and thriving towns along the route, is likely to be carried into satisfactory and speedy execution.—*Boston Courier.*

**Schuylkill County.**—By the census of '40, the population of Schuylkill county is set down at 29,051. From the great improvement in business, and rapid increase of population, there is no doubt but that the population of the county at this time, exceeds 40,000 inhabitants. Few counties in the State have increased more rapidly than Schuylkill in population since 1840.

**Extraordinary Steam Hammer.**—A huge hammer, worked by steam, has recently been erected at the works of Messrs. Peter Cato & Co., Liverpool, which, while it strikes with a force of five tons, is yet capable of such nice adjustment as to crack a walnut without bruising the kernel. Messrs. Morris &

Tasker, of this city, have one of the hammers in operation. They had it on exhibition at the last Fair of the Franklin Institute.

**Lake Superior.**—The following are the returns to the government office, of the copper ore taken out by the different companies for the month of January, viz: Pittsburg and Boston company, 300,000 lbs.; Copper Falls company, 20,000; Bohemia, 40,000; North West, 10,000; Eagle River, boulders pure, 1,000; Eagle Harbor, 4,000; North Western, 4,000; Suffolk, 200,000; Luc La Belle, 20,000.

**Iron Bridge Rail.**—Mr. Wood, of the British Iron Company's works in Abersychan, recently succeeded in rolling iron rails weighing 90 lbs. per yard, and 30 feet in length. These rails are said to be perfect, and very nicely finished. It is difficult to say where the limits to the size of iron rails will be found.

**The Wheeling Bridge.**—Books were opened at Wheeling for subscriptions to the stock for the bridge over the Ohio at Wheeling. At the end of the second day, \$92,000 of stock was taken, and the first instalment paid. The books were to be kept open another day. We think the whole stock required is \$200,000.

**Railways.**—Strong efforts are making to raise means for constructing railways from Pittsburg westward, through Ohio, and to connect with Lake Erie at Cleveland. Two routes are proposed. One through Beaver, Salem, etc. to Akron, thence north to Cleveland, and southwest by Wooster, etc., to Columbus and Cincinnati. The other from Wellsville, by Canton, Massillon and Wooster to Columbus, branching north to Cleveland. Either of these plans, it is claimed, will save the expense of two roads, for a considerable distance. The line from Pittsburg or Wellsville, to Akron or Massillon, to be used as part of the line connecting Cleveland

with Pittsburg and the east, and southeast, and also as the line connecting Cincinnati with Cleveland, Pittsburg and the eastern cities.

### BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

### MISSING NUMBERS OF THE RAILROAD JOURNAL.

Subscribers, who wish to obtain Missing Numbers of Back Volumes of this Journal, will do well to apply immediately.

One or two COMPLETE SETS of the Railroad JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

### ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—

For sale or imported to order by the subscriber. These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,

75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.	Weight per fathom.	Diameter of iron.	Tons.	
	INCH.	LES. OZ.	INCH.	LES. OZ.	LES.	INCH.		
11	4½	13 5	10	24 -	50	15-16	20	
13	3½	8 3	8½	16 -	27	11-16	13½	
14	3½	6 11	7½	12 8	17	9-16	10½	
15	2½	5 2	6½	9 4	13½	1-2	7½	
16	2½	4 3	6	8 8	10½	7-16	7	

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1y24

### RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolser of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,]

WILLIAM ROE, Sup't of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed,] G. A. NICOLL,

Sup't Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,] T. L. SMITH,

Jersey City, November 4, 1845.

N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car. For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed,] JOHN LEACH,

Jamaica November 12, 1845.

1y19 Sup't Motive Power.

# **RICH & CO'S IMPROVED PATENT SALAMANDER SAFES.**

Warranted free from dampness, as well as fire and thief proof.

Particular attention is invited to the following certificates, which speak for themselves:

## **TEST No. 10.**

*Certificate from Mr. Silas C. Field, of Vicksburg, Mississippi.*

On the morning of the 14th ult., the store owned and occupied by me in this city, was, with its contents, entirely consumed by fire. My stock of goods consisted of oil, rosin, lard, pork, sugar, molasses, liquors, and other articles of a combustible nature. In the midst of which was one of Rich's Improved Patent Salamander Safes, which I purchased last October of Mr. Isaac Bridge, New Orleans, and which contained my books and papers. This safe was red hot, and did not cool sufficiently to be opened until 16 hours after it was taken from the ruins. At the expiration of that time it was unlocked, when its contents proved to be entirely uninjured, and not even discolored. I deem this test sufficient to show that the high reputation enjoyed by Rich's Safes is well-merited.

S. C. FIELD.

## **TEST No. 11.—Certificate.**

By the fire which occurred in this village on the 27th July last, our Law Office, together with many other buildings, was destroyed—we had in our office one of Rich's Improved Patent Salamander Safes, which, though heated red hot, preserved, without being the least damaged, many papers valuable to our clients—the envelopes of a few papers being slightly scorched. Some twenty-four hours after the fire, the Safe was removed, and so hot was it, that several hours were required for it to cool off. Our office was in the second story of a large brick building, all the wood used in construction of said house being pitch pine. While the Safe was red hot, one of the walls tumbled in, and so injured the lock that it was necessary to break the door open. From this test, we feel no hesitancy in recommending "Rich's Patent Salamander Safe" as *entirely fire proof*.

GORRÉ & KING.

Marion, Ala., Sept. 15th, 1846.

*Still other Tests in the Great Fire of July 19, 1845.*

The undersigned purchased of A. S. Martin, No. 134½ Water street, one of Rich's Improved Patent Salamander Safes, which was in our store, No. 54 Exchange place. The store was entirely consumed in the great conflagration on the morning of the 19th inst. The safe was taken from the ruins 52 hours after, and on opening it, the books and papers were found entirely uninjured by fire, and only slightly wet—the leather on some of the books was parched by the extreme heat.

RICHARDS & CRONKHITE.

Benton, Miss., December 27, 1845.

One of Rich's Improved Salamander Safes, which I purchased on the 2d of June last of A. S. Marvin, 134½ Water street, agent for the manufacturer, was exposed to the most intense heat during the late dreadful conflagration. The store which I occupied, No. 46 Broad street, was entirely consumed; the safe fell from the 2d story, about 15 feet, into the cellar, and remained there 14 hours, and when found, I am told, and from its appearance afterwards, should judge that it had been heated to a red heat. On opening it, the books and papers were found not to have been touched by fire. I deem this ordeal sufficient to confirm fully the reputation that Rich's safe has already obtained for preserving its contents against all hazards.

(Signed.)

WM. BLOODGOOD.

New York, 21st July, 1845.

Reference made to upwards of nine hundred and fifty merchants, cashiers, brokers, and officers of courts and counties, who have Rich's Safe's in use.

The above safes are finished in the neatest manner, and can be made to order at short notice, of any size and pattern, and fitted to contain plate, jewelry, etc. Prices from \$50 to \$500 each. For sale by

A. S. MARVIN, General Agent,  
134½ Water st., N. Y.

Also by Isaac Bridge 75 Magazine street, New Orleans.

Also by Lewis M Hatch, 120 Meeting street Charleston, S. C.

# **FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

TO THOSE INTERESTED IN Railroads, Railroad Directors and Managers are respectfully invited to examine an improved SPARK ARRESTER, recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger and freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Buren, Engineer and Supt Hartford and New Haven Railroad; W. R. McKee, Supt Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Supt New Jersey Railroad Trans. Co.; J. Elliott, Supt Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Supt Elizabethtown and Somerville Railroad; R. R. Ouyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Supt Macon Railroad, Macon, Ga.; J. H. Cleveland, Supt Southern Railroad, Monroe, Mich.; M. F. Chittenden, Supt M. P. Central Railroad, Detroit, Mich.; G. B. Flak, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckley & Drury, Boston, will be promptly executed. FRENCH & BAIRD.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

•• The letters in the figures refer to the article given in the Journal of June, 1844.

ja45

## **PATENT HAMMERED RAILROAD, SHIP**

and Boat Spikes. The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 9 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed.

JOHN F. WINSLOW, Agent.  
Albany Iron and Nail Works, Troy, N. Y.  
The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merriut, New York; J. H. Whitney, do.; E. J. Etting, Philadelphia; Wm. E. Coffin & Co., Boston.

ja45

## **MACHINE WORKS OF ROGERS,**

Ketchum & Grosvenor, Patterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR,  
ja45 Patterson, N. J., or 60 Wall street, N. York.

## **PATENT RAILROAD, SHIP AND BOAT**

Spikes. The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

•• Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

ja45

## **SPRING STEEL FOR LOCOMOTIVES,**

Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1½ to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,

## DAVENPORT & BRIDGES'

### CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes. 10¢

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis is 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.	
4,224 Timbers, 11 ft. long, 3 x 6 inches =	
68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	
4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs. at 4½ cts. =	101 25
Workmanship free of patent charge =	600 00

Cost of one mile including the laying of the Rail = \$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.

Civil Engineer and Patentee.

No. 277 South Tenth St., Philadelphia. 331

## FRANKLIN HOUSE,

No. 103 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the Franklin House, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor, D. K. MINOR.

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,  
105 Chestnut Street,  
PHILADELPHIA, P.A.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

## BOSTON AND MAINE RAILROAD.

Upper Route, to Portland and the East.

## SUMMER ARRANGEMENT, April 1, 1847.

### PORTLAND TRAINS.

Leave Boston at 7 A.M. and 3 P.M.  
Leave Portland at 7 A.M. and 3 P.M.

### GREAT FALLS TRAIN.

Leave Boston at 5 P.M.  
Leave Great Falls at 6 A.M.

### HAVERHILL TRAINS.

Leave Boston at 11 A.M. and 6-20 P.M.  
Leave Haverhill at 6 A.M. and 4 P.M.

### READING TRAINS.

Leave Boston at 8 A.M. and 8 P.M.  
Leave Reading at 6 A.M. and 1 P.M.

### MEDFORD BRANCH TRAINS.

Leave Boston at 7 A.M., 9 A.M., 3 P.M., 5 P.M.  
Leave Medford at 6 A.M., 11 A.M., 4 P.M.

The Depot in Boston is on Haymarket Square.

Passengers are not allowed to carry Baggage above \$50 in value, and that personal, unless notice is given, and an extra amount paid, at the rate of the price of a Ticket for every \$500 additional value.

31 ly CHAS. MINOT, Super't.

## SUMMER ARRANGEMENT.—NEW YORK AND ERIE RAILROAD LINE, from April 1st until further notice, will

run daily (Sundays excepted) between the city of New York and Middletown, Goshen, and intermediate places, as follows:

FOR PASSENGERS—  
Leave New York at 7 A.M. and 4 P.M.  
" Middletown at 6 A.M. and 5 P.M.

Fare reduced to \$1.25 to Middletown—way in proportion. Breakfast, supper and berths can be had on the steamboat.

FOR FREIGHT—  
Leave New York at 8 P.M.  
" Middletown at 12 M.

The names of the consignees and of the staff where to be left, must be distinctly marked upon each article shipped. Freight not received after 9 P.M. in New York.

Apply to J. F. Clarkson, agent, at office corner of Duane and West sts. H. C. SEYMOUR, Sup't.

March 25th, 1846.

Stages run daily from Middletown, on the arrival of the afternoon train, to Milford, Carbondale, Honesdale, Montrose, Towanda, Owego, and West, also to Monticello, Windsor, Binghamton, Ithaca, etc., etc. Agent on board. 13

## NORWICH AND WORCESTER RAILROAD.

Road. Summer Arrangement. Change of Hours. Commencing on Wednesday, April 31, 1847.

Accommodation Trains, daily, (except Sunday.) Leave Norwich, at 6 a.m., and 4 p.m. Leave Worcester, at 6 a.m., and 4 p.m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston, and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 3 p.m. train from Boston.

New York Train via Steamboat—Leave Norwich for Boston, every morning, except Monday, on the arrival of the steamboat from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 4 p.m., daily, except Sunday, stopping at Danielsonville and Norwich.

Freight Trains daily each way, except Sunday.—Leave Norwich at 7, and Worcester at 6 30 a.m. Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are Less when paid for Tickets than when paid in the Cars. 31 ly J. W. STOWELL, Sup't.

**LITTLE MIAMI RAILROAD.—OPEN**  
**TO SPRINGFIELD.**—Distance 84 miles—  
 connecting at Xenia and Springfield.  
 Field with Messrs. Neil, Moore,  
 & Co's. daily daylight lines of stages going east  
 and north, to Columbus, Zanesville, Wheeling,  
 Cleveland, and Sandusky City, via Urbana, Belle-  
 fontaine, Kenton, and the Mad river and Lake Erie  
 railroad, or Columbus, Delaware, and the Mansfield  
 and Sandusky City railroad—forming, by these con-  
 nections, the cheapest and most expeditious route to  
 Buffalo, Niagara Falls, Rochester, Albany, New  
 York, and Boston.

On and after Thursday, August 13, 1846, until  
 further notice, a Passenger train will run as follows:  
 Leave Cincinnati daily at 9 A. M., for Milford,  
 Foster's Crossing, Deerfield, Morrow, Fort Ancient,  
 Freeport, Waynesville, Spring Valley, Xenia, Old  
 Town, Yellow Springs, and Springfield.

Returning, will leave Springfield at 4 hours 35  
 minutes A. M. A line of Hacks runs in connection  
 with the Cars, between Deerfield and Lebanon.

Fare—From Cincinnati to Lebanon....\$1 00  
 " " " Xenia.....1 50  
 " " " Springfield...2 00  
 " " " Columbus...4 00  
 " " " Sandusky city 8 00

The Passenger trains runs in connection with  
 Strader & Gorman's line of Mail Packets to Louis-  
 ville.

Tickets can be procured at the Broadway Hotel,  
 Dennison House, or at the Depot of the Company,  
 on East Front street.

Further information and through tickets for the  
 Stage lines, may be procured at P. Campbell, Agent  
 on Front street, near Broadway.

The company will not be responsible for baggage  
 beyond 50 dollars in value, unless the same is re-  
 turned to the conductor or agent, and freight paid at  
 of a passage for every \$500 in value over that  
 amount.

The 11 P. M. train from Cincinnati, and the 2  
 40 P. M. train from Xenia, will be discontinued on  
 and after Monday, the 10th instant.

A freight train will run daily.

W. H. CLEMENT, Sup't.

**BALTIMORE AND OHIO RAILROAD.**  
**MAIN STEM.** The Train carrying the  
 Great Western Mail leaves Bal-

timore every morning at 7; and  
 Cumberland at 8 o'clock, passing Ellicott's Mills,  
 Frederick, Harpers Ferry, Martinsburgh and Han-  
 cock, connecting daily each way with—the Wash-  
 ington Trains at the Relay House seven miles  
 from Baltimore, with the Winchester Trains at  
 Harpers Ferry—with the various railroad and  
 steamboat lines between Baltimore and Philadelphia  
 and with the lines of Post Coaches between Cum-  
 berland and Wheeling and the fine Steamboats on  
 the Monongahela Slack Water between Brown-  
 ville and Pittsburgh. Time of arrival at both Cum-  
 berland and Baltimore 5 1/2 P. M. Fare between  
 those points \$7, and 4 cents per mile for less distan-  
 ces. Fare through to Wheeling \$11 and time about  
 26 hours, to Pittsburgh \$10, and time about 32 hours.  
 Through tickets from Philadelphia to Wheeling  
 \$13, to Pittsburgh \$12. Extra train daily except  
 Sundays from Baltimore to Frederick at 4 P. M.,  
 and from Frederick to Baltimore at 8 A. M.

#### WASHINGTON BRANCH.

Daily trains at 9 A. M. and 5 P. M. and 12 at  
 night from Baltimore and at 6 A. M. and 5 1/2 P. M.  
 from Washington, connecting daily with the lines  
 North, South and West, at Baltimore, Washington  
 and the Relay house. Fare \$1 60 through between  
 Baltimore and Washington, in either direction, 4  
 cents per mile for intermediate distances. 213y1

**MANUFACTURE OF PATENT WIRE**  
 Rope and Cables for Inclined Planes, Stand-  
 ing Ship Rigging, Mines, Cranes, Tillers etc., by  
 JOHN A. ROEBLING, Civil Engineer,  
 Pittsburgh, Pa.

These Ropes are in successful operation on the  
 planes of the Portage Railroad in Pennsylvania, on  
 the Public Slips, on Ferries and in Mines. The  
 first rope put upon Plane No. 3, Portage Railroad,  
 has now run 4 seasons, and is still in good con-  
 dition. 2v19 1y

**BALTIMORE AND SUSQUEHANNA**  
 Railroad.—Reduction of Fare, Morning and  
 Afternoon Trains between Balti-

more and York.—The Passenger  
 trains run daily, except Sunday, as follows:  
 Leaves Baltimore at.....9 a.m. and 3 1/2 p.m.  
 Arrives at.....9 a.m. and 6 1/2 p.m.  
 Leaves York at.....5 a.m. and 3 p.m.

**NEW YORK & HARLEM RAILROAD**

CO.—Winter Arrangement.

On and after Monday, November 23,

1846, the cars will run as follows:

Leave 27th street for 49d street, Deaf and Dumb  
 Institute, Yorkville, Harlem Morrisiana, and Wil-  
 liams' Bridge, at 7 o'clock a.m. From City Hall  
 for above named places, 2 p.m. [freight train.] 2 30

p.m. 5 p.m. to Morrisiana only.  
 Leave City Hall for Harlem, Morrisiana, Ford-  
 ham and Williams' Bridge, at 7 45 a.m., and 10 45

a.m.; 1 15 p.m., 2 p.m. [freight train.] 2 30 p.m. and  
 3 45 p.m.

Leave City Hall for Hunt's Bridge, Bronx, Tuc-  
 kahoe, Hart's Corners White Plains, Davis' Brook,  
 Unionville and Pleasantville, [Pleasantville 4 miles  
 from Sing Sing.] 7 45 and 10 45 a.m.; 1 15 p.m., 2

p.m. [freight train], and 3 45 p.m.

#### RETURNING.

Leave Pleasantville, at 8, 10, [freight train], and  
 11 a.m.; 1 30, and 4 p.m.

Leave White Plains, at 8 12, 10 30, [freight train]  
 and 11 20 a.m.; 1 50, and 4 20 p.m.

Leave Tuckahoe, 8 35, 10 55, [freight train.] and  
 11 35 a.m.; 2 05, and 4 35 p.m.

Leave Williams' Bridge at 7 45, 8 50 and 11 50 a.  
 m.; 2 10, 4, and 4 50 p.m.

Leave Morrisiana 8 and 9 05 a.m.; 12 05, 2 35,  
 4 20, 5 05 and 6 p.m.

Leave Yorkville, at 8 12 a.m.; 4 35 and 6 15 p.m.

#### SUNDAY ARRANGEMENTS.

Leave City Hall for Pleasantville and intermedi-  
 ate places, at 7 45 a.m.; 1 15 and 3 p.m.

Leave Pleasantville for City Hall, at 8 a.m.; 11,  
 and 3 15 p.m.

Leave City Hall for Williams' Bridge and inter-  
 mediate places, 10 45 a.m.; 2 30 p.m.

Leave Williams' Bridge for City Hall, at 8 50  
 and 11 50 a.m.; 1, 3 45 and 4 05 p.m. 1y49

**PHILADELPHIA, WILMINGTON &  
 BALTIMORE RAILROAD.—1847.**

Winter Arrangement.

Philadelphia for Baltimore... 8 a.m. and 4 p.m.

Baltimore for Philadelphia... 9 a.m. and 8 p.m.

Connecting in Baltimore with Mail Lines south and  
 west, as per notice of the Baltimore and Ohio Rail-  
 road—and with Mail Lines north from Philadelphia,  
 both morning and afternoon.

Sundays, the Morning Lines do not run in either  
 direction.

Accommodation train from Wilmington to Phi-  
 ladelphia, leaves Wilmington at 8 a.m. and returns  
 at 9 p.m.

J. R. TRIMBLE,

Engineer and General Superintendent.

**GEORGIA RAILROAD. FROM AU-**

**GUSTA TO ATLANTA.—171 MILES.**

AND WESTERN AND ATLANTIC RAILROAD FROM AT-

LANTA TO OOTHEALOGA, 80 MILES.

This Road in connection with

the South Carolina Railroad and

Western and Atlantic Railroad now forms a con-  
 tinuous line, 268 miles in length, from Charleston  
 to Oothcaloga on the Oostenaula River, in Cass Co.,  
 Georgia.

RATES OF FREIGHT.

		Between Augusta and Oothcaloga and Dalton.	
		20 miles.	26 miles.
1st class.	Boxes of Hats, Bonnets, and Furniture, per cu- bic foot.....	16	26
2d class.	Boxes and Bales of Dry Goods, Sadlery, Glass, Paints, Drugs and Con- fectionary, per 100 lbs.	1 00	1 50
3d class.	Sugar, Coffee, Liquor, Bagging, Rope, Cotton Yarns, Tobacco, Lea- ther, Hides, Copper, Tin, Feathers, Sheet Iron, Hollow Ware, Castings, Crockery, etc.	0 60	0 85
4th class.	Flour, Rice, Bacon, Pork, Beef, Fish, Lard, Tal- low, Beeswax, Bar Iron, Ginseng, Mill Gearing, Pig Iron, and Grindstones, etc.....	0 45	0 70
	Cotton, per 100 lbs.....	0 45	0 65
	Molasses, per hoghead.....	8 50	13 50
	" " barrel.....	2 00	3 25
	Salt per bushel.....	0 17	
	Salt per Liverpool sack.....		95
	Ploughs, Corn Shellers, Cultivators, Straw Cut- ters, Wheelbarrows...	0 75	1 37

German or other emigrants, in lots of 20 or  
 more, will be carried over the above roads at 2 cents  
 per mile.

Goods consigned to S. C. Railroad Co. will be  
 forwarded free of commissions. Freight may be  
 paid at Augusta, Atlanta, or Oothcaloga.

J. EDGAR THOMSON,

Ch. Eng. and Gen. Agent.

Augusta, Sept. 2d, 1846. 44 1y

**THE WESTERN AND ATLANTIC**  
 Railroad.—This Road is now in operation to  
 Oothcaloga, a distance of 80 miles, and connects  
 daily (Sundays excepted) with the Georgia Rail-  
 road.

From Kingston, on this road, there is a tri-weekly  
 line of stages, which leave on the arrival of the cars  
 on Tuesday, Thursday and Saturday, for Warren-  
 ton, Huntsville, Decatur and Tusculumbia, Alabama,  
 and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga  
 for Chattanooga, Jasper, Murfreesborough, Knox-  
 ville and Nashville, Tennessee.

This is the most expeditious route from the east to  
 any of these places.

CHAS. F. M. GARNETT,

Chief Engineer.

Atlanta, Georgia, April 16th, 1846. 1y1

**PASCAL IRON WORKS.**

**WELDED WROUGHT IRON TUBES**

From 4 inches to 4 in calibre and 3 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T, L, and other fixtures to suit, fitting together with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by

**MORRIS, TASKER & MORRIS.**  
Warehouse S. E. Corner of Third & Walnut Streets,  
**PHILADELPHIA.**

**T**O LOCOMOTIVE AND MARINE ENGINE Boiler Builders. Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 3 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufacture: and for sale by

**MORRIS TASKER & MORRIS,**  
Warehouse S. E. corner 3d and Walnut Sts., Philadelphia. 117

**P**ATENT INDESTRUCTIBLE WATER

Pipes. The subscribers continue to manufacture the above PIPES, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York.

**J. BALL & CO.**

The next trials took place at Butterly, Codnor Park, Derbyshire, at the Iron Works belonging to Mr. W. Jessop. But they were, in all respects, so similar to those at Milton, that in order to avoid a tedious repetition, we will not enter into details, as the testimony of the respected proprietor, in a letter to a friend of the patentee, on the results, will be amply sufficient.

Butterly, June 21, 1844.

DEAR SIR: I forwarded to you a piece of puddled iron in the rough bar, made from pig iron which had been electrised by thirty-two jars, and it is as good a specimen of puddled iron as I ever saw. It was puddled the day after you were at Condor Park. I cannot understand how electricity should act on the iron, but it certainly has a good effect in purifying the iron from the extraneous matter with which it is alloyed. I must leave it to Dr. Ure to explain the phenomenon. All the work people agree in the fact.

I am, dear sir, your's truly,  
W. JESSOP.

The following report was given by Dr. Ure soon after the experiments at Butterly:  
London, 13 Charlotte St., Bedford Square, }  
July 13, 1844. }

Mr. Wall's patent process for improving iron is founded on the well-established fact, that when a compound is subjected to an electrical current, its negative and positive elements are detached from one another. Crude iron contains more or less carbon, sulphur, phosphorus, arsenic, silicon, oxygen, bodies

all electro-negative in relation to iron, which is electro-positive. When impure iron, as it flows from blast furnaces, is subjected, during its cooling and consolidation, to a powerful stream of voltaic electricity, the chemical affinities by which its various heterogeneous components are firmly associated, are immediately subverted, whereby, in the case of crude iron, the sulphur and phosphorus, which destroy or impair its tenacity and malleability, become readily separable in the act of puddling. On this principle, I would explain the extraordinary effect of Mr. Wall's patent electric process, as performed in my presence in the excellent iron works of Mr. Jessop, at Condor Park, Derbyshire, where the electrised forged pigs discharged those noxious elements so copiously in the puddling furnace as to become, after a single re-heating, without piling or faggotting, brilliant bars of the finest fibrous metal. The bars so made have been subjected, under my inspection, to the severest proofs, by skilful London blacksmiths, and they have been found to bear piercing, hammering, bending and twisting, as well as the best iron in the market. I have analysed the said iron with the utmost minuteness of chemical research, and have ascertained it to be nearly pure metal, containing neither sulphur or phosphorus, and merely an inappreciable trace of arsenic. I can, therefore, conscientiously recommend Mr. Wall's patent process to ironmasters, as one of the greatest, easiest, and most economical improvements which their art has ever received.

The pecuniary advantages of this process, in respect to saving of labor and waste of material, has been estimated by competent judges at from one pound to two pounds sterling per ton.

The effect of electrising iron is displayed in a singular manner by the conversion into steel of a soft rod, exposed, in contact with coke, for a few hours, to a moderate red heat—a result which I have witnessed and can fully attest.

ANDREW URE, M.D. F.R.S.

Prof. Chemistry and Analytical Chemist.

In further confirmation of the concluding paragraph of Dr. Ure's report, is the subjoined attestation.

Manning's Foundry, Blackwall, }  
July 16, 1844. }

We, the undersigned, do hereby certify, that we were present and saw Mr. Wall put a bar of iron, one inch broad by one-quarter of an inch on the edge, and two feet long, into a crucible, and in four hours it was taken out perfect blistered steel. During the process of conversion a small voltaic battery was applied, to which we attribute the results of the experiments. It is our joint opinion that no iron could be converted into steel in so short a time by the mere application of heat and carbonaceous matter as is generally used in that process.

B. MANNING,  
Proprietor.

WM. TIMMONS,  
Head Blacksmith, who worked the bar of steel.

The satisfactory results of the trials which have been enumerated, produced an impression novel as it was gratifying. A new era was pronounced to have commenced in the metallic departments, and if the plan were fairly dealt with, the market would soon be freed from that brittle and delusive article which had so long been imposed upon it.—When its efficiency, also, which had been so incontestably established, was considered in conjunction with the simplicity of its arrangement, and the trivial cost required for its purchase, all were unanimous as to the propriety of adopting so beneficial an agent. The consequences may be anticipated. Mr. Wall was literally besieged by the most pressing invitations from every part of the country: so that it became a matter of some difficulty how to act, or in what direction to proceed. Priority of application was the rule adopted, and as Wm. Scholefield, Esq., of Parkgate, stood first on the list, Mr. Wall proceeded to his establishment, where he arrived on the 27th of July, 1844.

The following day the first experiment was tried. To a mass of seven tons, was applied a battery consisting of forty pairs of platinized silver and zinc, eight inches by four, or more accurately, an exposed surface of six inches by three and a half, after deducting tare for clamps, etc. On the poles being brought into contact, vivid brushes of electricity were observable even in broad daylight. The two iron conductors attached to the pole wires issuing from the battery, and which were intended to convey the electricity to the molten mass, were found to be completely soldered together, and required the utmost exertion to separate them. The operations of such a battery were watched with the most intense interest, and the highest expectations were entertained of the results.—And they were fully answered. The metal, when afterwards puddled, hammered, and rolled, was found to be of the most excellent quality; its strength and fibre astonished all present, and the proprietor himself declared that he would not have believed it, had he not been an eye witness.

To give a narrative of the numerous and almost daily trials which took place at these works up to the end of February, 1845, would be tedious to the reader, and indeed superfluous. It would be more interesting to peruse the correspondence which passed between Mr. Wall and Mr. James Geach, manager of the furnaces, who superintended the battery, and minutely watched every trial during that period. His testimony will be unhesitatingly admitted by all who are acquainted with him, and his opinion, while emanating from one fully competent to decide, will not be suspected of any undue bias.

The following is the letter sent by Mr. Geach after Mr. Wall's departure.

Parkgate Iron Works, Rotherham, }  
August 9th, 1844. }

DEAR SIR: I received yours in due course of post, and in answer, beg to state, that Mr. Manning (Mr. Wall's assistant) is getting on well, and wrote you yesterday according to

your desire, and stated that the Earl Fitz-William called here the evening before, with his steward, Mr. Birom. I showed him some of the samples of the electrified iron, such as the specimens you took with you, at which he appeared much pleased, and wished to see some trials made himself, and desired me to let him know when you were coming here again, that he might meet you. I am happy to say the results of the iron are as usual. I had a cast of mottled metal electrified on the morning of your leaving for town, and that proved as good as the Nos. 3 and 4; and was worked together with them without at all deteriorating the manufactured article.— Perhaps white iron may answer in the same ratio, but not having had any, I cannot say further. On reading Dr. Ure's report in your's of yesterday, I can but add my testimony on the results of the iron flowing from the furnace into the beds, and being electrified—then being puddled, shingled and bolted down into billets, and four inch bars: and the fracture caused in breaking, compared with that of iron made in the ordinary way, is as *best or best best* to common. The cheapest and least troublesome way is, in my opinion, to connect the poles of the battery to the blast furnace, and electrify the iron therein before tapping, and then run it into pigs in the usual way. Some experiments were tried when you were here in that way, and the results were, that the iron was quite as good, if not better, than that run into the beds and electrified afterwards. I have made sixty or seventy tons more or less of this pig iron, and plates of iron, and invariably find it to be of excellent quality. Several specimens of Parkgate iron you have with you of experiments made at these works, will fully prove my assertions; and I consider it one of the best, easiest, and greatest improvements ever made in the manufacture of iron, by expelling all the sulphur, arsenic, etc., when in its crude state, before its being brought to the puddling furnace; and that a great saving will be effected in the manufacturing department.

I am, dear sir, yours respectfully,

JAMES GEACH.

The following are but extracts, as the letters contain other matters irrelevant to the subject under consideration.

Parkgate Iron Works, Dec. 4, 1844.

DEAR SIR: I am happy to inform you that no other iron is to be used at these works but that which has been electrified. We made some *best best* boiler plates from scrap iron last week, in the regular way; and some of the electrified iron, made into bolts, and reheated, and rolled off made much better than that. Our bars, sheets, etc., are all as good as can be wished for. I had almost forgot to say, some of our puddled bars have been sent into Staffordshire for trial, of which I have specimens, and can assure you they are most excellent. The Staffordshire gents, as far as I can understand, do not know what to make of it, not having seen the process as yet; but I think you might do some good among them were you to try.

JAMES GEACH.

Parkgate Iron Works, Dec. 20, 1844.

DEAR SIR: At Milton, Messrs. Graham have decided on keeping the battery on, and it was put to work again last Tuesday. For some weeks previously, they had been trying the strength of the metal after being electrified, and *vice versa* with puddling also.— Here we use all electrified iron, and I am happy to say, with such results, as have quite dumb-founded all who had so much to say against it. There was a trial yesterday by simple puddling, and ball-furnacing, then rolling into sheets, plates and bars, finished iron, and I can now aver that it is *better* than any of the *best best best* iron that was ever made on these works since they first started.

JAMES GEACH.

In conformity with the above extracts, might be cited the testimony of Dr. Dyson, the superintendent of the works. The apprehensions, however, of this gentleman, respecting the invention, were novel and somewhat ludicrous. He maintained that in the event of its adoption, an universal and confused equalization would take place; the countries now producing bad ore and worse metal, would be on a par with those which sent the *best best* article into the market. The process of reasoning by which it is attempted to show that an invention, which improves what is defective, deteriorates what is good, is difficult to comprehend; and we can but lament a state of things, in which such arguments are allowed to prevail in opposition to the improvements which genius and industry would introduce into science and art. To make the *best best* iron from common cinder, without admixture of rich ore or purer metal, has hitherto baffled the efforts of iron-masters. This, electricity has, in a great measure, achieved by forcing this refuse or peroxide of iron to give up its oxygen without any mixture, and thus bringing it almost to an equality with common merchant iron. But if such be the effects of the application of electricity to an inert and apparently useless mass of refuse, what must be the results of its action on good ore and superior metal. Or are we to suppose that it will be less efficient where there are fewer obstacles, and where its sphere of action is more favorable. Such reasoning is on a par with the excuses which were alledged for discontinuing the use of the battery at another great establishment, after the most convincing proofs of its efficiency and utility.

Among the numerous applications received by Mr. Wall, was one from Sir John Guest, the proprietor of the extensive works at Dowlais, in Wales. Well versed in chemistry, and familiar with the phenomena of electricity, Sir John, on reading the report of Dr. Ure, entered into the full merits of the question and convinced of the efficiency and importance of the discovery, at once proposed to enter into arrangements for a share in the patent. But a decided negative was given, on grounds highly creditable to Mr. Wall, who immediately saw that such a proceeding would materially injure, if not destroy, all the small manufactories, scarcely able, in the

actual state of things, to co-exist with the colossal establishment of the Welsh leviathan.

However, a trial was solicited and agreed upon; and on the 28th of August, 1844, Mr. Wall, having procured a battery of platinized silver and zinc of 100 pairs, eight inches by three and a half, left London, accompanied by an assistant, and arrived at Dowlais the following day.

Fortunately Sir John was at Dowlais, and Mr. Wall was directed by him to proceed to the works, where he would meet the superintendent, who had orders to render every assistance in his power. After a few preliminaries the battery was arranged for operations.

August 30, 1844.

"I had, says Mr. Wall, a small quantity of metal electrified to-day, in presence of the manager's son, as a prelude to further and more extensive operations. It was afterwards puddled with every care and attention; afterwards it was squeezed and rolled into puddled bars. Not a flaw was to be seen on the edge, nor indeed any of that deformity and brittleness observable in their ordinary metal. When cold, it was tested by breaking, and showed a fibre and tenacity equal to the *best* merchant bar. There was but one opinion on the subject, all the puddlers declared it to be the very best specimen of puddled bar which had ever been seen at their works. I was naturally desirous of preserving some specimens of this my first experiment here, for the purpose of showing them to Sir John Guest, as also to the head manager, who was confined to his house by sickness; but the said specimens were never seen afterwards, and when asked for could not be found. For the solution of the mystery, the succeeding experiments will enable the reader to form tolerably accurate conjectures.

September 4, 1844.

"A trial was made this day with twelve pairs of a Smee's battery on a lot of pig iron about 700 weight: the electricity being passed in a continuous stream through the mass. But at the end of 20 minutes I was obliged to desist, as the metal had become set. This I had never before observed to occur in so short a time. However I soon ascertained the cause to be the porous nature of the bed in to which the metal was run, being a compound of sand and half-pulverized coke cinder. This doubtless materially affected the results, as the battery was not allowed sufficient time to throw off the sulphur, etc., before the metal became consolidated. Besides the composition forming the bed for the metal, possessing a strong conductive power, impaired the effect of the electrical action. I have found metal, when in large quantities, and in sand beds, more effected by electricity produced from an ordinary battery of twenty-four pairs, than a few hundred weight acted upon by a battery of 60 pairs, when in a bed composed of the above materials. The larger quantity of metal, remaining longer in a fluid state, absorbs a greater portion of electricity, while the sand of which the bed is made prevents all escape of excess; whereas the rapid settling of a small quantity, checks

the electrical action, and the consolidated bar becomes itself a conductor, and dissipates the electric force amid the surrounding compound forming the bed. Although I was dissatisfied in my own mind, I allowed matters to proceed; and accordingly the electrised metal was puddled this afternoon, at the same time with some of the ordinary metal from the same furnace. This process had not long commenced, before appearances indicated some irregularity in the proceedings. The manager, who was present, was the first to express a remark on the occasion, and observed that the furnace the electrised metal was in seemed cold, as compared with the other furnaces, and that the metal did not boil. Nor was it intended to boil. My assistant chanced to hear the order given to the puddlers; the words were, 'Not to give the metal too much heat.' words intended, and well understood to convey a meaning beyond their literal import. In fulfilment of the injunction, no sooner had the metal assumed a semi-fluid state, about fifteen minutes after being thrown in, when the damper was let down on the chimney, and so effectually as to drive the flames out at the rake-hole over the grate, even to the hindrance of the puddler in his duty. The electrised iron was kept in the fire 20 minutes longer than the charge of ordinary metal; which, when taken out was squeezed and rolled in the usual manner, and presented the appearance of good iron. The electrised came out of the furnace scarcely balled, and held together only by means of the wheelbarrow full of cinder thrown in as its puddling complement. I need scarcely tell the result. It was squeezed as far as possible from the cinder, and when it was attempted to pass it under the roller, it crumbled in numerous fragments. I complained to the manager of the unfair treatment which this charge had received, and another charge of each metal was ordered to be worked. The person who had given the order on which I made a remark, was dismissed from his post, and another was appointed to superintend the puddling of the electrised metal. He worked the furnace much more efficiently, while not half the quantity of cinder was used in the process. The result was in every way satisfactory, and particularly gratifying from the circumstance of Sir John Guest arriving just at the time the rolling took place. As so favorable an opportunity might prove decisive, several trials and tests took place, and every means put in force to show the real qualities of the metal. My expectations were fulfilled, and the superiority of the process was triumphantly established."

It were useless to continue the narrative of the proceedings at Dowlais. The above extract is sufficiently conclusive of the efficiency and advantages of the process, and any further details would be only a tedious monotony. However, before proceeding to the illustration of the remark before made, respecting the application of the process to the peroxide of iron, it may not be uninteresting to give the results of a week's operations at the above named works.

Returns of puddled bar of electrised pig

metal at Dowlais, ending December 21st, 1844:—

	Dec. 17.	Tons.	Cwt.	Qrs.	Lbs.	Charges.

	Tons.	Cwt.	Qrs.	Lbs.
Product as above,	115	5	1	11
Total gain,	8	14	1	0

The above is an ordinary diurnal return of the operations during the use of the battery, and furnished by parties connected with the establishment.

The facts which have hitherto been adduced, were principally intended to demonstrate the advantages, of the application of Mr. Wall's process in improving the quality and simplifying the manufacture of iron. But there are other results not less worthy of notice, as being equally important and beneficial.

It is well known to iron manufacturers that the operations of the blast furnace are very powerfully affected by the state of the atmosphere, and that the changes of the barometer are invariably answered by corresponding alterations in the appearance and quality of the metal produced. This influence extends even to the furnace itself, which at different periods is found to sour, and exhibit other symptoms of derangement. In rainy, lowering or stormy weather, the cinder, the test as it were of the metal, is observed to be of a dark color, rough and lumpy, and emitted more vivid scintillations during its transmission from the furnace to the sand bed or receptacle. On the other hand, when the weather has set in fair or frosty, it becomes thin, of a bright appearance, smooth, and of a fuller consistence. This difference is very striking on any sudden alteration of the weather, on any occasion of any preponderance of either the positive or negative electricities in the atmosphere. "I have known the men," says Mr. Wall, "foretell the weather from the appearance of the cinder, more correctly than either Moore or Murphy." Aware of these facts, he continues, and convinced of the active agency of electricity in the cause, I naturally felt a great interest in watching the effect of a well regulated battery on such occasions. In the ordinary mode of manufacturing, any excess or deficiency in the concomitant materials, as of limestone for example, produces in a few hours an important change in the quality of the metal produced. These different sorts are designated by the terms, white,

mottled, gray, etc. For the purpose of experiment, therefore, I caused the feeds or charges of the smelting furnace to be frequently varied; sometimes the quota of lime stone was increased or lessened to an extent of one-fifth beyond the usual complement. At other times a similar proceeding was observed in regard to the ore. Still, where the action of the battery was regularly kept up, scarcely an alteration was perceptible; and it was not until the lapse of three or four days, that any material change was to be observed. On the other hand, when the smelting furnace was regularly supplied, and the charges uniform, not any variations in the atmosphere, however sudden and determinate, caused the slightest alteration. The metal was the same, the cinder equally smooth and clear in damp and stormy, as in dry and frosty weather. The regularly maintained action of the battery, counteracting all excess in the relative condition of the two electricities, preserved an equilibrium in the working of the furnace which delivered out its contents in one unchanged state and quality. In the ordinary process also, it was by no means rare to find Nos. 2, 3 and 4, together in the same bed, from the same tapping; owing to a derangement in the furnace, and an unequal distribution of carbon; while the electrised charges were alike in every particle, without mixture or alloy. This last circumstance was most satisfactorily shown, continues Mr. W., while I was operating at Dowlais during the early part of the month of December, 1844. On this occasion there were four furnaces, each working according to a different arrangement, and each fed by a distinct species of ore. The one making white or inferior metal, was selected for the experiment. The charges were ordered to be kept regular night and day. Although apparently indifferent, I was not inattentive, and felt confident of the result. At the end of twenty-four hours a change was visible. At first, a dull white, then a mottled, and lastly a No. 3 gray pig made its appearance, and this, he it remembered, from a furnace arranged and charged for white or inferior metal. There was the fact, evident, undeniable. But it was destined not to be long in view. It could not be disputed, but it might be counteracted. And so it was. No sooner was the phenomena espied by a certain official of the establishment, than an order was issued to alter the charge. This order was carried out in such a manner as to leave out all consideration of regularity or system in the feeding or working of the furnace. I myself saw the feed-board, or diary, and I was astonished at the utter recklessness which it exhibited. However, the facts sought after, were found and confirmed, and I did not think it worth while to enter into a discussion of motives, as it would neither remedy the matter, nor benefit science."

Another and most valuable boon conferred by Mr. Wall's process, is an increase in the product of metal from any given charge of the furnace, as compared with the ordinary mode of manufacture. An effect, as simple in its cause, as beneficial in its consequences.

The action of the battery, penetrating with the most active and subtle influence the whole melting mass, arrests, by dislodging it from its natural combination in the ore state, every particle of metallic substance; the molecules rush to each other from the exaltation of their affinities, and are thus prevented from running off in the form of a peroxide. As much as six per cent. of metal has been discovered by analysis in the slag or refuse from an ordinary worked furnace. This effect was particularly noticed during the experiments at Milton Iron Works. In the course of a few tappings, after the application of the battery, a difference was observed in the relative qualities of the metal and slag. The former appeared better, and the latter clearer. This circumstance was soon remarked by the furnace servers, as well as the manager, and at the end of a week, the metal product of the furnace was found to have increased, without any alteration in the charges, in the proportion of seven to nearly nine.

But there is yet another purpose more novel and interesting than any hitherto mentioned, to which Mr. Wall's process has been successfully applied.

Whoever has visited any of the great iron establishments, cannot fail to have observed the enormous heaps of refuse surrounding the furnaces, and in some places almost precluding all approach or passage to the various departments of the works. This hitherto useless mass, Mr. Wall has restored to notice, has drawn forth its neglected worth, and by the magic agency of electricity, has transformed an unsightly encumbrance into a valuable acquisition.

The first experiment took place at Downais on the 12th of November, 1844. The authorities directing that vast establishment, had witnessed and repeatedly been compelled to acknowledge the beneficial effects of the process in the more important branches of the manufacture of iron; but they could not be induced to adopt it, or reap the advantages to be derived from the use of it. However, on such a proposal, which seems to have been selected from its supposed impracticability, being accepted by Mr. Wall, they appear to have been somewhat puzzled; but doubtless relying on the futility of the experiments, they positively declared, that, if he succeeded in rendering the refuse available for any purpose, the battery should be immediately adopted throughout the establishment.

**Experiment.**—To two-thirds of slag or refuse was added one-third of No. 3 pig iron, in the puddling furnace. When the charge had reached a semi-fluid state, eight pairs of a Seeley's battery, arranged according to the principle of intensity, were applied by means of two wires attached to the pole rods of the battery. To one of the rods was fastened a non-conducting handle, which projected thro' the rake hole of the furnace, and was occasionally put in motion. The other was passed through the roof, so as to dip into the melting mass. The battery was kept in action about half an hour, or until the metal began to ball, when the electric process ceased.—The metal was found to have puddled, and

balling in every way similar to their best samples, and in the same space of time, while it appeared more glossy, smoother and freer from defect. The loss on the charge, which was of four hundred weight, was twenty four lbs. The iron was rolled into merchant bars, and also wrought into horse shoes, etc., without showing the least flaw or crack.

"I now thought," says Mr. Wall, "that the time of experiment was over, and that the object of my solicitude was attained, but I was mistaken. The two managers were confined to their houses by sickness. Accordingly, specimens of the metal were forwarded to them. The messenger, on his return, stated that the result was very satisfactory; but that they wished the process to be further proved on the refuse cinder alone, without any admixture of pig metal." Agreeable to this message, a second experiment was made, nothing but the *pure unalloyed* refuse was put into the charge, which was the same in quantity as on the previous trial. In this case the charge was fifteen minutes longer puddling; and required more time to boil before balling, which was slower, though equally good. There was no other difference observable during the operation. On its being drawn, the following were the results: The loss on the 400 weight was found to be 48 lbs. "The metal rolled," says Mr. Wall, "like a lump of butter;" it cleared well of its cinder when passing the rollers, and came out perfect bar iron. A fine regular surface glistened beneath the thin scale with which it was covered. It was ball-furnaced, re-rolled into merchant bar, and afterwards worked up like the former, into horse shoes, without flaw or crack, though punched cold. On being compared with the ordinary merchant bar, it was pronounced to be but slightly inferior in strength, with the advantage of a smoother and more perfect surface. Such were the results of this novel experiment.

Whatever may be said of the wisdom of referring the adoption or rejection of the process to the issue of such a trial, is of little consequence. The challenge was accepted, and the bold attempt achieved. From a mass of rubbish, hitherto regarded as fit only for repairing roads, or for ships' ballast, had been extracted metal adequate to all the ordinary purposes to which the merchant bar was applied. Honest prejudice, however strong, would have given way, and generously acknowledged its defeat. But pride is invincible, and jealousy bids defiance to proof. In vain are the well meant intentions of patriotic individuals clearly shown; or the advantages of a discovery obvious and incontestible. In vain is the credit of introducing a superior article into the market held out as a motive; or the frequent and dreadful evils which will be warded off, portrayed. The vilest trash may be palmed on a confiding public; life and limb may be in hourly jeopardy; boilers may burst; vessels blown up in high air; and the wail of victims may be borne across the waters; it will beat against the "dull, cold" ear of selfishness as unavailing as the surge against the rocky shore.

But enough. Although reason was con-

vinced, and facts brought out which, however astounding, prejudice was compelled to admit the battle was lost. Downais was to be freed from the intruder, and his system scattered to the winds.\*

In conclusion, we trust that the facts which have been recorded in these few pages, with the testimonies adduced, will have sufficiently established the truth of our leading assertion. To characterize an invention, as forming an epoch in the annals of science, may appear a bold expression; but when we consider the vast importance of the primary object of its operations, and the well authenticated phenomena we have detailed, the expression will hardly be deemed unwarranted.

"On the employment and application of iron, is founded every important step which marks the progress of the human race from barbarism to civilization. The difficulties which its reduction from a state of ore presents, the variety of conditions necessary for its being wrought into useful forms, and the pre-eminent advantages it possesses for the construction equally of the simplest tool and the most complex machine; all combine to excite the energies of a people, and impel them to mental activity and civilization. As gold and jewels are hence the type of ignorance and barbaric pomp, so iron is the greatest material source of intelligence and industry." An invention, therefore, to facilitate and simplify the manufacture of so precious an article, which augments its product, and improves its quality, cannot be too highly rated. Now, these effects we hesitate not to claim on behalf of Mr. Wall's patent. We have not hazarded bare assertions, nor assumed doubtful propositions, but have merely stated facts, with their respective dates. To have expected that it would have been adopted without demur, or escape opposition, would have been illusory, and have betrayed an ignorance of the records of science and of the history of social progress. Mr. Cort, on introducing his great improvement, was assailed with the bitterest acrimony, and his process of puddling was scouted as a chimera. Still, *magna est veritas*—whatever is founded upon just principles must eventually prevail, and all opposition, whether from ignorance or prejudice, from motives of jealousy or self-

\* Besides these adverse circumstances above mentioned, there were many others inconsistent with a fair trial. The puddling furnaces assigned to Mr. Wall for his experiments, were constructed for white metal, which balls without boiling. The electrified metal boils thin and swells much. The consequence was, that as it was worked in such furnaces, it ran out at the rake-hole, and over or through the bridges. This waste proceeded to such a degree, that the workmen were constantly piling up large blocks of lime stone, to prevent the metal totally running out. Now lime, as it is well known, is calculated to deteriorate the quality of iron, but failed in this instance doing so, as the metal, in puddled bar, was afterwards made into excellent rails, without the admixture of any merchant bar—a thing impracticable with their own puddled bar; as merchant bar, in such a case, to the extent of two-fifths, is indispensable. In addition to the above, the whole body of puddlers were in a state of hostility, from the imaginary fears that the process would reduce their labor. Indeed a considerable number of first-rate hands actually gave notice to quit if the process were continued.

interest, will serve only like the crucible to enhance its value, by proving the genuineness of its claims.\*

(To be Continued.)

#### Licking and Lexington Railway.

We are glad to have noticed some indications of activity in Kentucky, to obtain the means for constructing the railway from the mouth of the Licking to Lexington. Let the people along the line of the proposed road engage in this subject, as intelligent and able planters should do, and the work will be done at an early day. If they manifest no desire for the road, they need hardly look to Cincinnati for aid. The Lexington observer sees things in their proper light. It says:

No one can for a moment doubt its importance, who will take the trouble to look at the map of the U. States, and see what is doing elsewhere in this mode of improvement, which is destined to be the principal mode of connection and conveyance between the agricultural and commercial regions of every country on earth—bringing the surplus products of labor quickly and cheaply to the prominent places of demand and consumption.

With this road completed, our hemp and other heavy articles could be transported at half the present cost, via the Cincinnati and Erie railroad, as contemplated to be continued to the great northern markets; and every dollar thus saved would go into the pockets of our farmers and factors. And when Louisville shall have met us at Frankfort with her great work, we shall have the southern markets also brought to our doors, and an uninterrupted tide of prosperity will place our own beautiful and healthy city in its destined high position as to population and wealth.

\* It may perhaps have been expected, that in the course of the remarks on the experiments above detailed, allusion would have been made to some particular department of art, where the advantages derivable from the patent would be especially important and conspicuous. Such an idea did indeed occur; but, on a moment's reflection, it was deemed unnecessary to offer any suggestion. In a country, where the spirit of industry is so active, little more is required than to show the practicability of an improvement, to ensure its immediate adoption. There is, however, one branch which, from its rational interest, deserves especial notice. In the cast metal used in the ordnance department, Mr. Wall's patent will, by the expulsion of all deteriorating alloys, give a tenacity and consequent security hitherto unobtainable. That cumbersome, so unwieldy in pieces of large calibre, may be reduced at least one-seventh without in any degree impairing their strength or durability. Metal which has undergone the electrifying process, turns like wrought iron, and its superiority of fibrous texture to common cast, is equal to what wrought iron possesses over steel. This was fully proved during an experiment at Downais. A small battery, consisting of six pairs, five by three and a half inches, was applied to a mass of iron, from which was afterwards formed a cast roller for the rolling mill. The quantity was about sixteen hundred weight. It answered beyond expectation; and the machine has been in constant operation for upwards of twelve months, and it is as efficient as on the day it was first set to work. This test will be deemed satisfactory, when the great uncertainty respecting those machines is considered. Little or no reliance could be placed on their strength; scarcely a day passed without one or more suddenly dropping asunder, or becoming unserviceable. I have a letter now lying before me, from a friend of the patentee's, residing at Downais, giving full details of the circumstance. But after so many testimonies on the subject, it is hardly worth while to give any more extracts.

Correspondents will oblige us by sending in their communications by Tuesday morning at latest.

#### AMERICAN RAILROAD JOURNAL.

Published by D. K. MINOR, 105 Chestnut St., Philadelphia.

Saturday, May 15, 1847.

**CHAMPLAIN & CONNECTICUT RIVER RAILROAD**—Notice to Contractors.—Proposals will be received until the 1st day of June, 1847, for the Grading, Masonry and Bridging of that part of the Champlain and Connecticut River Railroad, extending from the west side of the summit at Mt. Holly to the Village of Brandon, a distance of about 34 miles, and being the whole uncontracted portion of said road.

Maps, Profiles and Specifications may be found after the 20th of May next at the Office of the Engineer in Rutland, where every necessary information will be given.

The line will be divided in sections of convenient length for construction, and from those to whom the work may be awarded, satisfactory security will be required.

Proposals may be left with the undersigned, at Burlington—with George T. Hodges, Esq., at Rutland—or with William Henry, Esq., at Bellows Falls.

The work will be awarded at Rutland, as soon after the 1st of June, as the necessary examination of the bids can be made. By order of the Board,

T. FOLLETT, President.

Office of the C. & C. R. R. Co., }  
Burlington, Vt., April 29, 1847. } 3:20

#### Wall's Improvements in the Manufacture of Iron and Other Metals—Continued.

We continue the publication of this highly interesting and valuable pamphlet, in this number of the Journal. Several inquiries have been made for the pamphlet, since the publication of our last number. We will therefore say that it will be continued in the Journal, until the whole is published; and thus the subscribers to the Journal will be put in possession of what we deem exceedingly valuable information, upon a very important subject.

#### Scientific Prophecy.

Newton expresses his deliberate opinion that cohesion, light, heat, electricity, and the communication of the brain with the muscles, are all to be referred to one and the same cause—an ether or spiritus which pervades all bodies. We might smile at such an opinion from many quarters; and had Newton been only the author of the "Principia," we might, says the Dublin Review, perhaps think his head a little exalted by the excitement attending the close of an arduous labor, (though, in truth, the scholium, from which the above is extracted, does not appear in the first edition;) but when we consider his prediction, that the diamond would be found to be combustible, that the earth has between five and six times its weight of water, and others which have turned out correct, we feel something like a presentiment that the opinion just cited, may in some degree share the same destiny.

#### Boston, Concord and Montreal Railroad.

The Boston Traveller states that of the \$240,000 new subscriptions to this road, about \$200,000 were taken in New Hampshire, and it is confidently ex-

pected that the road to Sanbornston, 18 miles from Concord, will be opened by the 1st of October. The remainder of the road to Plymouth, not already contracted for, will be put under contract immediately.

#### Champlain and Connecticut River Railroad.

Contractors, and others interested in the construction of railroads, will find another field for their enterprise by referring to the advertisement of the above named road in this number of the Journal. We are much pleased to learn that this work is progressing so rapidly. The present indications are only in accordance with our own early opinions and expressions in relation to it, viz: that the trade of western Vermont is of too much importance to the people of Boston, for them to yield it without a much greater effort than is requisite to ensure the construction of this road. Boston will not rest in her efforts, in a north and northwesterly direction, until there are at least three—or four lines of railroad reaching Canada line, or Lake Champlain—and two to Montreal, and one to Ogdensburg, but no one of them will, in our opinion, be more useful to community, or profitable to the stockholders than this.

#### Passumpsic River Railroad.

The St. Johnsbury "Caledonian" has the following remarks upon the cheering prospects of the Connecticut and Passumpsic Rivers railroad. The Montreal road, which is spoken of below, is also in good prospect of success, and active operations will commence upon the line this Spring. The Caledonian says:

"We are glad to see the official development of the intentions of the Board of Directors of the Passumpsic and Connecticut Rivers railroad company—such as appears in the advertisement for contracting thirty-four miles, in addition to the section contracted for some time since, and upon a portion of which the grading has been completed. The intention is, we understand, to have some forty miles of the road completed, and the cars upon it in October, 1848. In the mean time, other portions of the route will be put into such a state of forwardness as circumstances and the funds of the company may warrant.

"The good success of our Canadian friends in regard to opening a road from Montreal to the line, will, we doubt not, stimulate the friends of the Passumpsic road, to use all necessary exertions in order to be ready to 'hitch on' at the earliest day possible.

"The proposals advertised, embrace thirty-four miles, which with the sections heretofore contracted, include the entire division between the mouth of White river and Wells river, forty miles.

"At a recent meeting of the Board of Directors, it was decided to proceed with all reasonable despatch with the construction of this portion of the road, and there is no reason to doubt but the cars will run to Wells river in the course of next year.

"This part of the road must do a heavy business immediately on its completion—traversing, as it does, the best portion of the valley of the Connecticut river north of Greenfield, Mass. There is not, in any part of New England, a more flourishing farming district, nor a greater diffusion of water power. The villages and towns along the line indicate a profusion of wealth and prosperity unusual for the country.

"In completing the locating survey, the line is found much more favorable than was indicated by the preliminary survey, and no grade upon this forty miles will exceed twenty-six feet per mile.

"It is understood that arrangements have been made for a connection and a general depot of the

three roads—the Northern, the Passumpsic, and the Vermont Central—at the mouth of White river.”

The Vermont lines will be opened early next season to Burlington, and thus establish an important steam communication with Montreal, but they cannot expect to command at that city the great exports of bread stuffs from the west to Europe.

Judge Hopkins, in his able report, informs us that “the navigation of the St. Lawrence below Ogdensburg is dangerous and very expensive, and the freight on a barrel of flour from Ogdensburg to Montreal is thirty cents, and much of every season higher, besides extravagant insurance.”

As has already been shown, adds the Courier, the entire outlay for transportation to Boston from Ogdensburg will be but 21½ cents per barrel, or one-half the proposed charge of 43 cents per barrel, of course no line terminating at Montreal can enter into successful competition for the bread stuffs. The Canadian trade will be reached at Montreal; the great trade of the west can be effectually commanded only at Ogdensburg.

#### New York and Boston Direct Railroad.

We cheerfully give place to the following communication, and hope to see the work early commenced on the line.

For the American Railroad Journal.

Of the four applications for the extension of this line through Massachusetts, the Committee of the Legislature reported in favor of the one connecting with the Boston and Providence road, 11 miles from Boston, and the bill presented by them has passed the house, and has also passed the senate, and ere this has undoubtedly received the governor's signature, and become a law. This is the shortest of the four lines prayed for, and of course well suited for the “air line” road.

The Legislature of Rhode Island holds its session in June, when it is believed that the only remaining portion of the line, for which charters are needed, viz: 18 miles through Rhode Island, will be granted. Upon the route thus chartered, the distance from N. York to Boston, by actual survey, is 210 miles;—which distance, by further improvements in the line, will probably be reduced to 207 miles, being from 24 to 27 miles shorter than the line by way of Springfield. Means to complete the portion between New York and New Haven are already provided. From New Haven to the east line of Connecticut, subscriptions to the capital stock, to a considerable amount, have already been made; and now that it is deemed certain that the whole line will be chartered, the total amount required will doubtless soon be obtained.

Past experience shows that the most of the travel between Boston and New York will take the shortest and quickest route, to avoid the loss of time and casualties that attend the navigation of the Sound.

It is proposed to build the direct route in such a manner as to ensure a speed from five to ten miles more per hour than can be obtained on any existing road. This advantage, combined with the saving in distance, will give it much the larger portion of the through travel between New York and Boston. The revenue from this source is however not needed to sustain the road. The way business, it has been ascertained, is ample for this purpose. The population upon the portion between New Haven and Boston being greater per mile than upon the line via Springfield.

The roads upon the latter route are doing a good business, the great portion of which is local, or way travel, and freight, and will therefore continue to pay good dividends, even after the direct route

is constructed. This is the opinion of the friends of those roads, as is evident from the expense which is being incurred to render the road more perfect between New Haven and Hartford, and from the movement which the Western railroad company is making towards laying a second track upon their road, between Springfield and Worcester. The corporation of which we are speaking, have thus far stoutly opposed the direct route. Public opinion, however, is settling strongly in favor of the latter. It is seen that it will not interfere with the proper business of any other road, and in addition to the reasons assigned above, of a saving in time, etc., it is becoming apparent that a line of road like that from Boston to Springfield, which is designed mainly for the transportation of freight, and as a means of communication westward towards Albany and Buffalo, cannot, without great interference, danger and delay, be made part of a main line of communication between Boston and New York.

In the charter obtained from the State of Connecticut, for the direct route, the right is given to bridge the Connecticut river at Middletown. This act has been asserted to be unconstitutional, the State not having the right to authorize the construction of a bridge over navigable waters, but a recent decision of the supreme court of the United States, puts this question at rest. It is declared that the States possess the same power as before the constitution was formed. Railways, as a means of intercommunication, are more important, in most cases, than the inland navigation of the country. Hence the same reason, which for years past has rendered the preservation of the navigation of our inland waters an object of peculiar care, is now applicable in a greater degree to railways. Fortunately, the improvements in draw bridges are such, that no material obstruction is caused to the navigation of a stream in crossing it with a railway.

#### Ogdensburg and Lake Champlain Road.

The Boston Courier learns with pleasure that Mr. James Hayward, the engineer of this route, has succeeded in finding a very cheap, direct and feasible route for this important line of railroad. The line which he recommends, and the directors have adopted, commences at Ogdensburg, and terminates at Rouse's Point, at the outlet of Lake Champlain. A line already chartered, connects Rouse's Point with the Central and Rutland railroads at Burlington, and thus a continuous line, unbroken by a ferry will be opened between Ogdensburg and Boston.

By extending the St. Johns and Laprairie railroad 20 miles more from St. John's to Rouse's Point, a continuous railroad will also be opened between Montreal and Ogdensburg, and Montreal and Boston.

The Vermont and Cheshire lines will be opened next year, and so easy are the routes from Rouse's Point to Montreal, and from the same to Ogdensburg, that if the stock unsubscribed be taken this Spring, we may have next year a continuous road to both Ogdensburg and Montreal; and after breakfasting in Boston, reach either of them by a fast train the same evening.

The Ogdensburg railroad, adds the Courier, presents many attractions to the capitalist.

1st. It is unusually cheap, costing with a 60 lb. rail, but \$19,000 a mile.

2d. The western half has no curves less than ten thousand feet radius, and the eastern half none less than five thousand feet.

3d. It is nearly an air line; of one hundred and fifteen miles, the entire length, one hundred are air line.

4th. It has no ascending grade from the west that exceeds 26 feet, and none ascending from the east, exceeding 39 feet to the mile.

5th. The despatch with which it may be constructed, and the favorable opportunity which presents itself to avail of the flood of emigrants now pressing into the country, to construct the line at low rates.

#### Receipts on Thirty-two English Railways.

The following statement, in continuation, shows an increase of \$54,223 85—over the preceding two weeks; and an aggregate of \$1,387,125 63.

## MASSACHUSETTS ANNUAL RAILROAD REPORTS.

Return of the Nashua and Lowell Railroad Co, under the Act of April 16, 1846.

Capital stock, [was originally \$380,000: was increased to lay a second track, in 1845, to].....	\$500,000
Increase of capital since last report.....	
Capital paid in, per last report.....	500,000
Capital paid in since last report.....	
Total amount of capital stock paid in.....	500,000
Funded debt, per last report.....	
Funded debt paid since last report.....	
Funded debt, increase of, since last report.....	
Total present amount of funded debt.....	
Floating debt, per last report.....	
Floating debt paid since last report.....	
Floating debt, increase of since last report.....	
Total present amount of floating debt.....	
Total present amount of funded and floating debt..	
Average rate of interest per annum on do.....	

The corporation is not in debt.

## COST OF ROAD AND EQUIPMENT.

For graduation and masonry, per last report [upon this point].....	82,917 68
For graduation and masonry, paid during the year, [for a second track not completed at our last annual report].....	12,534 19
Total amount expended for graduation and masonry [including new second track].....	\$93,451 87
For bridges, per last report, [included in the item for superstructure; the accounts not having been kept separately, it is difficult now to separate them]	
For bridges, paid during the past year.....	
Total amount expended for bridges.....	
For superstructure, including iron, per last report, [this includes bridges].....	126,704 04
For superstructure, including iron, paid during the past year, [including bridging for new track]	107,294 31
Total amount expended for superstructure, including iron.....	233,998 35
For stations, buildings and fixtures, as per last report.....	
For stations, buildings and fixtures, paid during the past year, [carried to miscellaneous expense acc't]	
Total amount expended for stations, buildings and fixtures.....	23,757 53
For land, land-damages and fences, per last report.	
For land, land-damages and fences, paid during the past year.....	
Total amount expended for land, land-damages and fences.....	79,074 15
For locomotives, per last report.....	
For locomotives, paid during the past year.....	
Total amount expended for locomotives, [except what has been carried to depreciation account]..	91,759 69
For passenger and baggage cars, per last report....	
For passenger and baggage cars, paid during the past year.....	
Total amount expended for passenger and baggage cars.....	5,146 71
For merchandize cars, per last report.....	
For merchandize cars, paid during the past year..	
Total amount expended for merchandize cars.....	90,101 09
For engineering and other expenses, per last report.	20,539 11
For engineering and other expenses, paid during the past year.....	171 50
Total amount expended for engineering and other expenses.....	20,710 61
Total cost of road and equipment.....	500,000 00

## CHARACTERISTICS OF ROAD.

Length of road.....	75,389 2 feet.
Length of single track.....	6,329 feet.
Length of double track.....	69,060 2 feet.
Length of branches owned by the company, stating whether they have a single or double track.....	No branch owned by Co.
Weight of rail per yard in main road.....	56 lbs.
Weight of rail per yard in branch roads.....	
Maximum grade, with its length in main road.....	19.7 ft. per mile; 4,133 ft.
Maximum grade, with its length in branch roads..	
Total rise and fall in main road.....	73.5 feet.
Total rise and fall in branch roads.....	
Shortest radius of curvature, with length of curve in main road.....	636 feet, 100 feet long.
Shortest radius of curvature, with length of curve in branch roads.....	
Total degrees of curvature in main road.....	770 deg.
Total degrees of curvature in branch roads.....	
Total length of straight line in main road.....	6.73 miles.
Total length of straight lines in branches.....	
Aggregate length of truss bridges.....	400 feet.
Whole length of road unfinished on both sides....	

## DOINGS DURING THE YEAR.

Miles run by passenger trains.....	28,515
Miles run by freight trains.....	18,615

Miles run by other trains.....	1,740
Total miles run.....	48,870
Number of passengers carried in the cars.....	192,272
Number of passengers carried one mile.....	192,272 = 2,678,713
Number of tons of merchandize carried in the cars.	126,502 1968-2000
Number of tons of merchandize carried one mile..	126,502 1968-2000 = 1,835,129 1040-2000
Number of passengers carried one mile, to and from other roads.....	158,472 = 2,230,838
Number of tons carried one mile, to and from other roads.....	123,387 168-2000 = 1,762,935
Average rate of speed adopted for passenger trains, including stops.....	22 miles.
Average rate of speed adopted for freight trains, including stops.....	13 miles.
Estimated weight in tons of passenger trains, including engine and tender, but not including passengers, hauled one mile.....	65,108 75-2000 = 976,631
Estimated weight of merchandize trains, including engine and tender, but not including freight, hauled one mile.....	122,332 42-2000 = 1,984,966 30

## EXPENDITURES FOR WORKING THE ROAD.

For repairs of road, maintenance of way, exclusive of wooden truss bridges and renewals of iron: [Including 1655 feet wood construction at Lowell]	\$22,701 12
For repairs of truss bridges.....	180 72
For renewals of iron, including laying down.....	
For wages of switch-men, gate-keepers and flag-men.....	913 00
For removing ice and snow.....	140 00
For repairs of fences, gates, houses for flag-men, gate-keepers, switch-men, tool-houses.....	1,005 73
Total for maintenance of way.....	24,940 57
MOTIVE POWER.	
For repairs of locomotives.....	2,061 22
For new locomotives to cover depreciation, [none within the past year; but in 1844, the engine Lion was purchased, and carried to depreciation acc't]	6,450 00
For repairs of passenger cars.....	2,396 76
For new passenger cars to cover depreciation.....	None within the last year.
For repairs of merchandize cars.....	4,901 86
For new merchandize cars to cover depreciation...	637 98
For repairs of gravel and other cars.....	35 62
Total for maintenance of motive power.....	10,064 44

## MISCELLANEOUS.

For fuel and oil.....	8,308 57
For salaries, wages and incidental expenses, chargeable to passenger department.....	6,028 55
For salaries, wages and incidental expenses, chargeable to freight department.....	12,402 32
For gratuities and damages.....	1,150 00
For taxes and insurance.....	1,910 57
For ferries.....	
For repairs of station building, aqueducts, fixtures, furniture.....	3,153 28
For interest.....	
For amount paid other companies in tolls for passengers and freight carried on their roads, specifying each company.....	Nothing.
For amount paid other companies as rent for use of their roads, specifying each company.....	Nothing.
For salaries of president, treasurer, superintendent, law expenses, office expenses of the above offices, and all other expenses not included in any of the foregoing items.....	4,136 13

## INCOME DURING THE YEAR.

## For Passengers:

1. On the main road exclusively, including branch owned by company.....	27,982 11
2. To and from other roads, specifying what: [Concord]....	31,110 37

## For Freight:

1. On main road and branches owned by company.	32,064 50
2. To and from other connecting roads:	31,529 75
U. S. mails, \$2,249 20. Rents, \$6,12 17. Interest and miscellaneous, \$1,928 45.....	4,789 82
Total income.....	127,496 55
Net earnings after deducting expenses.....	57,217 17

## DIVIDENDS.

Surplus not divided.....	7,217 17
Surplus last year.....	5,448 95
Total surplus.....	12,666 12

## ESTIMATED DEPRECIATION BEYOND RENEWALS, VIZ:

Buildings.....	
Engines and cars.....	

DANIEL ABBOTT,  
CHARLES F. GOVE,  
THOMAS B. WALES,  
JESSE BOWERS,

Directors of the Nashua  
& Lowell Railroad.

**Baltimore and Pittsburgh.**

The Pittsburg Gazette, of Wednesday last, contains the following official report of the proceedings of the Stockholders of the Pittsburg and Connellsville railroad company, held on the 27th ult.

**STOCKHOLDER'S MEETING.**

*Pittsburg and Connellsville R. R. Co.,*  
Pittsburg, April 27th, 1847. }

In pursuance of adjournment, the Stockholders of the Pittsburg and Connellsville railroad company, met this day at 3 o'clock P. M., at Philo Hall, and were called to order by Wm. Eichbaum, Chairman.

Wm. M. Darlington was appointed Secretary.

The proceedings of a public meeting of the citizens of Baltimore, held in that city on the 3d inst., and of a meeting of the Stockholders of the Baltimore and Ohio railroad company, held on the 5th inst., were then read for the information of the meeting.

Neville B. Craig, Esq., from the committee on the subject of the Baltimore connection, presented the following report and resolutions which were unanimously adopted:

The committee appointed at the last meeting of the stockholders, have had under consideration the course of action proper to be adopted at this time; and although entirely conscious of the great impatience of many of their fellow citizens, and of their eager desire to embark in some other scheme of improvement, and to abandon one which hitherto has been productive only of repeated delays and disappointments, feel disposed to make one effort more to complete an arrangement by which the very liberal charter under which we act shall be made to contribute to the prosperity, not only of the cities of Pittsburg and Baltimore, but of the intervening country.

In arriving at this conclusion the committee frankly acknowledge that it is influenced as much by the kind and friendly feeling manifested by the citizens of Baltimore at their late meeting, and by a respect for the wishes and interests of those of our own company who reside along the route of the proposed improvement, as by their own judgment on the subject.

The committee feel, however, that too much time has already been spent in fruitless negotiations, and that the subject now demands a speedy and final decision.

The committee, therefore, offers the following resolutions:

Resolved, That the Stockholders of the Pittsburg and Connellsville railroad company, in consideration of the very friendly disposition manifested towards our proposed work by the merchants and other citizens of Baltimore, and especially from a regard for the interests of those of our own number residing along the Youghiogany river, who look upon the work as the last promise of a participation in the benefits of the great scheme of internal improvements, are disposed to make one effort more to complete an arrangement with the Baltimore and Ohio railroad company. Therefore,

Resolved, That the whole subject be referred back to the Directors of this company,

with full power to act in relation to this whole matter, and to report the result of any correspondence or inferences which they or any committee appointed by them may hold with any other persons, to a meeting of the stockholders of this company on the 19th day of May next.

Resolved, That when this meeting adjourn it will adjourn to meet again on Wednesday, the 19th day of May, 1847, at 3 o'clock P. M. to take into consideration the report which will be made by the directors, and also to consider the law passed at the last session of the legislature in relation to this company, and to adopt such measures as may be determined to be expedient and proper.

A. W. Loomis, Esq., was excused from serving on the committee on the subject of a western railroad, and Joshua Hanna was, on motion, substituted in his place as chairman, and Wm. Ebbs was appointed a member of said committee.

The Hon. J. C. Plumer, of Westmoreland county, presented the following proceedings of a meeting held at West Newton, which were, on motion, ordered to be published with the proceeding of this meeting.

On motion the meeting adjourned.

WM. EICHBAUM, Chairman.

WM. M. DARLINGTON, Sec'y.

In pursuance of public notice, a meeting of the Stockholders in the Pittsburg and Connellsville railroad company, and of the citizens of the surrounding country generally, was held at the schoolhouse in the borough of West Newton, on Thursday, the 22d of April, 1847, to deliberate on, and express their sentiments respecting a connection of said company with the Baltimore and Ohio railroad company. The meeting was called to order by J. C. Hanna, Esq. nominating Col. J. B. Oliver to the chair, and D. F. McConaughy, Secretary.

The object of the meeting being made known, several addresses were delivered by gentlemen present, when, on motion, a committee of three, consisting of Abel J. C. Plumer, Major James Gardiner and Amos Biggs, Esq., were appointed by the chair to draft resolutions expressive of the views of the meeting.

The committee, after having retired a short time, reported the following:

Whereas, The Baltimore and Ohio railroad company have declared their determination to carry their road to a southern terminus on the Ohio river, but have expressed a willingness to aid liberally in making a branch to the city of Pittsburg—and, whereas, a connection of the cities of Pittsburg and Baltimore by railroad is most desirable, therefore,

Resolved, As the sense of the Stockholders of the Pittsburg and Connellsville railroad company, residing in West Newton and vicinity, a difference of opinions as to the route or location of the Pittsburg and Connellsville railroad to connect with the Baltimore and Ohio railroad company, and the city of Baltimore, ought not to prevent the construction of said road with the least possible delay, and we advise a compromise of all difficulties heretofore raised on the subject.

Resolved, That we approve of suggestions thrown out by the Baltimore and Ohio railroad company, as to the subscription of stock sufficient to ensure the completion of said road; and thus make a connection between the cities of Pittsburg and Baltimore, by railroad, complete. And we pledge ourselves as Stockholders of the Pittsburg and Connellsville railroad company, to raise by further subscription, our proportion of seven hundred and fifty thousand dollars. And we are of opinion that this company ought at once to guarantee the aforesaid sum.

Resolved, As the sense of this meeting, that the Board of Managers of the Pittsburg and Connellsville railroad company ought to enter into further negotiation with the Baltimore and Ohio railroad company, and the city of Baltimore, on the aforesaid subject, with a determination to overlook the past as to route, and harmonize all differences, that the road may be constructed as soon as possible.

Which, being read, were unanimously adopted by the meeting. And, on motion, Abel J. C. Plumer, Major James Gardiner and Randle Johnson were appointed a committee to lay the proceedings of this meeting before the Stockholders of the Pittsburg and Connellsville railroad company, who are to assemble in the city of Pittsburg on Tuesday, the 27th inst., and request their adoption.

J. B. OLIVER, Chairman.

T. W. McCONAUGHEY, Sec'y.

**Triumph of American Mechanics.****AN INTERESTING COMMUNICATION.**

The Baltimore Sun has been furnished with the annexed highly interesting letter, which we give to our readers entire—believing that it will be perused with the highest satisfaction by all who are interested in the advancement of American mechanics.

St. PETERSBURG, March 20, 1847.

*Visit of the Emperor Nicholas to the Workshops of Messrs. Harrison, Winans and Eastwick.*

On the 10th of this month, his majesty the Emperor Nicholas I, visited the establishment of the American contractors, Messrs. Harrison, Winans & Eastwick, at Alexandroffsky, six miles from St. Petersburg, known as the "Alexandroffsky Head Mechanical Works of the St. Petersburg and Moscow Railway," and where is being constructed the machinery for the railway above mentioned.

His majesty had fixed 12 o'clock for leaving the railway station at St. Petersburg, and punctual to the hour arrived at the appointed place, and after spending a few moments in examining the locomotive at the head of the train, started for the workshops at Alexandroffsky, where the train arrived in about eight minutes. His majesty was accompanied by his imperial highness, the Grand Duke Alexander Nikolaevitch, the heir to the throne; his imperial highness, the Grand Duke Constantine Nikolaevitch, the second son of the Emperor; his highness the Duke of Leuchtenberg, son-in-law of the Emperor; field marshal Prince Paskevitch d'Erwan, viceroy of Poland; his excellency Prince Menschikoff, minister of marine, and head

admiral of the Russian navy; his excellency Count Chernicheff, minister of war; his excellency Count Orloff, minister of police; his excellency Count Keimichel, minister of way, communications and public buildings; his excellency Count Disalleff, minister of the imperial domains; his excellency Gen. Rockasoffsky; Admiral Lufke; the counselor of state; Gen. Fischer, director of the department of railways; Col. Kraft, director of the southern division of the St. Petersburg and Moscow railway; Col. Melnikoff, director of the northern division of the St. Petersburg and Moscow railway, and Major G. W. Whistler, engineer of the St. Petersburg and Moscow railway.

His majesty was received at the door of the works by the contractors, and after the usual presentations, proceeded to examine the works, entering at the south door of the great machine shop. The distinguished visitors first went to the upper floor, where all the small work for the locomotives are prepared for the erecting shop. His majesty examined everything very closely in this part of the works, making many inquiries of the contractors, who explained all the various operations that were going on. His majesty expressed himself much pleased with the beauty and finish of the parts of the locomotives. He much admired the very beautiful and efficient tools which the contractors have adapted to the various branches of the works, and frequently called the attention of his ministers to them. His majesty, after making the entire circuit of this room, next visited the lower floor, where the cylinders, driving wheels, frames, and all other heavy parts of the locomotive are prepared; here the same minute inspection was also made as above stairs—after which the party proceeded to the erecting shop, where the engines are finally put together. Here was to be seen the locomotive in every stage, from the boiler and parts just brought in, to the full, finished machine, cleanly painted and beautifully polished. His majesty expressed himself much pleased with the order and neatness of this department, and after witnessing the testing of the boiler of the locomotive by hydraulic pressure, proceeded to the boiler shop; here his majesty, among other things, examined the machine for forming copper tubes, and had the process explained to him; also, the operations of the self acting punching and shearing machines for preparing boiler plates, all of which were in active operation. From the shop, the distinguished visitors went to the iron foundry, and here his majesty saw the process of casting a large driving wheel, which seemed to interest him very much.

The shops where the wheels, axles and trucks are made for the tenders and freight cars was next visited, and all parts worthy of attention examined; from thence to the steam forge hammer shop, where the steam forge hammer, from its novel principle, elicited much attention. His majesty then went to the magazines for finished work; here were shown more than one hundred locomotives, quite complete, with all their finished parts cleanly polished, and the whole of the ma-

chine painted of an uniform color. His majesty expressed himself much pleased with the appearance of the work, and was surprised that so much had been completed in so short a time; eighty of the locomotives have been built entirely during the year 1846, and the establishment was turning out six locomotives and tenders every month. His majesty re-entered the railway train at the magazine, and went by the railway about one mile to the new works erected by the contractors for making the freight and passenger cars. Here his majesty alighted and proceeded to the shop where the wood is prepared entirely by machinery for the freight cars. Here everything was examined with the same attention as at the locomotive department, and the beauty and efficiency of the machinery commented upon in strong terms by his majesty, all the various operations being explained by the contractors. In this shop there are prepared every day, five sets of wood work for the usual size eight wheel box cars, such as are on the American railroads.

From the preparing shop, his majesty and suit went to the erecting shop for freight cars, where the parts are brought together after coming from the machines. In this department twenty-five men put together five box cars complete every day. By this it will be seen how little is left to be done by hand after the parts come from the machines. From this shop his majesty walked to the shop for making passenger cars, where was seen this work in all its stages, from the commencement to the entirely finished carriage. This branch of the work is just fairly in operation and now ready to turn out four of the usual sized eight wheel passenger cars every month. After examining all that was worthy of attention, the Emperor proceeded to the railway carriage, having then seen the whole of the various operations going on at the Alexandroffsky Head Mechanical Works. Previous to getting into the railway carriage, his majesty thanked the contractors for the pleasure he had received in viewing their works, and after shaking them by the hand, the train was put in motion for St. Petersburg, where it arrived about half past three o'clock. The engine which brought his majesty to the works and back, was, by request, run by one of the contractors. On the following day, as a testimony of his majesty's satisfaction, he promoted Colonels Kraft and Melnikoff to the rank of Generals, and ordered the cross of St. Anne to be conferred upon Major G. W. Whistler, the American engineer; also that valuable diamond rings should be presented to the contractors, Messrs. Harrison Winans & Eastwick.

The establishment of Messrs. Harrison, Winans & Eastwick employs at present, 1,920 workmen, including 1,613 Russians, 121 Germans, 164 Swedes, 17 English, and 5 Americans, which number embraces the whole number of foremen and workmen.

The contracts of Messrs. Harrison, Winans & Eastwick embrace 162 twenty-five ton locomotives and tenders; 5,300 iron trucks, for eight wheel cars; 2,500 eight wheel freight

cars; 70 passenger cars, and 2 improved cars on 16 wheels, 80 feet long. Out of which are now finished, 106 locomotives with their tenders; 6,200 wagon trucks; 906 freight cars, and 2 passenger cars.

#### ITEMS.

**Minersville.**—The intelligent and enterprising citizens of Minersville seem determined to keep pace with the neighboring towns in the region, in the way of improvement. It is gratifying to see the manifestations of thrift and prosperity every where evident in this thriving borough. New, neat and comfortable buildings are springing up in all parts of the town, as if by magic. In 1840, the population of Minersville borough was 1,265. According to the present estimate of well informed persons, it now contains over 2,500 inhabitants, having fully doubled its population in seven years. Minersville is one of the best markets in the coal region, and this region is among the best markets in the State for all agricultural products. — *Anthracite Gazette.*

**Steam Communication with the West Indies.**—We understand that a company has recently been formed, in our city, with a capital of some \$60,000, the whole of which has been taken, for the purpose of establishing a communication with Havana. It is in contemplation to build a suitable boat for this purpose, which will also touch at Key West. — *Charleston Courier.*

**Fatal Railroad Accident.**—We learn from the Lowell Courier that on Saturday evening about seven o'clock, as the cars from Concord were approaching the city, near the jail, the engineer discovered a man upon the track. He rung the bell, to give warning, and also reversed the engine; the man saw the cars coming, but was apparently so much frightened that he did not know where to go, although there was plenty of room either side of the track. The train struck him and passed over his body, mangling him in a shocking manner. His name was Edward Croghan, and he resided on Lowell street. He was about sixty years of age, and has left a wife and five children.

**The Southern Telegraph.**—The communication with the south by means of the telegraph, is still frequently interrupted, by the wires being detached at Gray's ferry bridge, in order to open the draw, to allow vessels to pass through. This vexatious hindrance to the permanent advantage of the southern line will soon, however, be removed, as the cord is to be conducted over the wire bridge, and along the road west of the Schuylkill, to a point where the junction with the line reaching to Baltimore will be made. The posts are already planted along the new route.

**Reading and Pottsville Telegraph.**—This line is expected to go into operation as far as Pottsville by the 15th inst. There will be stations at those places, and one has already been opened at Richmond. The charge will be half a cent each word to Richmond, one cent a word to Reading, and a cent and a half each word to Pottsville. No message to be counted less than ten words.

**Improvement to the Magnetic Telegraph.**—Colonel H. W. Cleveland, who has been connected with the line of Magnetic Telegraph, since their first establishment, as an assistant, has we learn by a recent discovery, overcome the difficulty heretofore labored under, of crossing water courses, by a peculiarly insulated wire which is passed in a leaden pipe under water. One of these wires or improvements, has recently been placed under the draw bridge at Gunpowder river, and has been in successful operation for several days. It is, we believe, the intention of this company to adopt this mode of connection at the several draws and streams along the line, which will obviate much the vexatious interruptions heretofore experienced. If the North river and other rivers can be crossed with this improvement, it will be one of great advantage.

**From Rochester Direct to England.**—A correspondent of the Rochester Democrat indulges in some rather high strung speculations in regard to the future lake trade. We are not sure, says the editor of the Democrat, but that, if the St. Lawrence be declared free, his anticipations may be realized. In case that measure, which is said to be the favorite scheme of the new Governor General, is effected, Rochester will become the most important point on the lake. Situated in the centre of supplies, and doing the most extensive business in bread stuffs in the world, with a safe and capacious harbor six miles in length, she will soon become the great emporium of traffic on lake Ontario. She has plenty of lumber for ship building, an abundance of material for constructing mills and unlimited water power for propelling machinery. Flouring mills can be constructed on the lower water power at half the cost elsewhere, because any amount of the best kind of stone can be had on the spot. While the upper mills will continue to trade with New York city, as at present, through the Erie canal, the lower ones will do an equally large business with Montreal or with England direct. The river for six miles is deep enough to float ships of the largest class, and there is scarcely a rod from the pier to the landing where vessels might not be perfectly safe at anchor, the banks varying from 20 to 50 feet in height. One thousand vessels could be moored along the banks of the river, and still have a channel sufficiently wide for two ships to pass.

**Hydraulic Engine.**—Mr. Elisha Bishop, of Jamestown, New York, has invented and furnished us with a description and drawings of an engine on a novel plan, but on true scientific principles, and calculated to supply the place of water wheels for propelling machinery, etc. We shall not attempt a full description without an engraving, but merely say that it consists in part, of two large vertical cylinders with pistons and rods extending up to two cranks on the two ends of a horizontal shaft above. The bottoms of the cylinders are furnished with large disk valves, of peculiar construction, and so arranged that while water is admitted into one of the cylinders from a water pipe or penstock at the

bottom, the water is discharged from the other, and vice versa, alternately. Thus while the force of the water is applied to raising one piston, the other is forced down by atmospheric pressure equal to the weight of the water contained in the cylinder, and the valves are reversed by a simple connection of machinery, on the approach of each piston to the bottom. No other packing is required, than that of an ordinary pump piston, and consequently there will be but little friction. The power is communicated from a drum or gear wheel mounted centrally upon the crank shaft. It may succeed well.—*Sci. American.*

**The Railroad.**—On Saturday, the directors of the Columbus and Xenia (or Springfield) railroad met with the city council of this city, and the commissioners of the county, and had a consultation on the future action in relation to this road. Every thing went off in the most harmonious manner, each expressing the greatest anxiety that the road should be made.

The old directors of the road offered their resignations, to give the city and county an opportunity of electing new ones, and a committee of one from each ward on the part of the city, the three county commissioners, and five from the stockholders of the road were appointed to meet on Tuesday, and propose a new set of directors. This done, a re-survey will commence, and the work be put under contract as soon as possible. The city council also appointed a delegation of two, (Joseph Ridgway and Dr. Goodale) to go to Wheeling, and meet the president, (Mr. McLane) and directors of the Baltimore and Ohio railroad company, who are to be there on Wednesday, in relation to extending the Baltimore and Ohio railroad to Wheeling, if it should be a point, as the law contemplates, or a point near there, directly through Ohio to Columbus, and pointing to St. Louis.

It is expected that Mr. McLane will visit Ohio and reconnoiter as far as Columbus and perhaps farther west. A strong invitation is sent for him, and we have pretty fair assurances that he will find it to the interest of the company, of which he is president, so to do.—*Ohio Statesman.*

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

### MISSING NUMBERS

#### OF THE RAILROAD JOURNAL.

Subscribers, who wish to obtain Missing Numbers of Back Volumes of this Journal, will do well to apply immediately.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

**THE SUBSCRIBER IS PREPARED TO** execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip.  
New York.

**RAILROAD IRON.—THE "MONTGOMERY" Iron Company,** Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to **MURDOCK, LEAVITT & CO.,**

1748 77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC Cement.** This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floods and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper barrels, by **JOHN W. LAWRENCE,** 142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 3317

**A. & G. RALSTON & CO., NO. 4** South Front St., Philadelphia, Pa.

Have now on hand, for sale, Railroad Iron, viz: 180 tons 2½ x 1 inch Flat Punched Rails, 20 ft. long. 25 " 2½ x 1 " Flange Iron Rails. 75 " 1 x 1 " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures. 117

### LOCOMOTIVE AND CAR AXLES.

The Subscribers are now prepared to receive orders for the well known and approved *Reading Locomotive and Car Axles*—drawn to any required pattern from Bloom Iron only. Address

**SAM'L KIMBER & CO.,**  
Willow Street Wharf,  
Philadelphia, Pa.

### RAILROAD IRON.—THE NEW JERSEY

Iron Company, Boonton, N. J., are now preparing to make Railroad Bars, and are ready to take orders or make contracts for Rails, deliverable after the first of December next. Apply to

**FULLER & BROWN, Agent.**

No. 139 Greenwich, corner of Cedar street.

September 18, 1846. 1039

### RAILWAY IRON.—DAVIS, BROOKS

& Co., No. 68 Broad Street, have now in port on Ship-board, 200 Tons of the best English heavy H Rails, 60 lbs. to the lineal yard, which they offer for sale on favorable terms, also, about 6 to 700 Tons now on the way, to arrive shortly, of the same description of Rail. 4611

### PIG AND BLOOM IRON.—THE SUBSCRIBERS

are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axle Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by

**A. WRIGHT & NEPHEW,**  
Vine St. Wharf, Philadelphia.

### TO CONTRACTORS.—KENNEBEC AND

**PORTLAND RAILROAD.**—Proposals will be received at this office until the 15th of May, for the Grading and Masonry of 28 miles of this road, extending from North Yarmouth to Bowdoinham, and the Branch Road from Brunswick to Bath, including the masonry for the Bridges across the Androscoggin, New Meadows and Cuthance rivers. The line of road and the plans and profiles will be ready for examination on the 10th of May; after which time any information in relation to the work can be had at this office, or of the Resident Engineers on the line of the road.

Persons unknown to the officers of the company, must accompany their bids with satisfactory evidence of their ability to execute the work.

The remainder of the line from Bowdoinham to Augusta, 21 miles, will be ready for contract about the 15th of June; of which due notice will be given.

**GEO. S. GREENE, Eng. K. & P. R. R.**  
ENGINEERS OFFICE, K. & P. R. R.,  
Brunswick, Me., April 6, 1847. 1m16

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

**ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.**—For sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

**ALFRED L. KEMP,**  
75 Broad street, New York, sole agent in the United States.

*Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.*

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.		Weight per fathom.	Diameter of iron.	
	INCH.	LS. OZ.	INCH.	LS. OZ.		LS.	INCH.	Tons.
11	4½	13 5	10	24 -		50	15-16	20
13	3½	8 3	8½	16 -		27	11-16	13½
14	3½	6 11	7½	12 8		17	9-16	10½
15	2½	5 2	6½	9 4		13½	1-2	7½
16	2½	4 3	6	8 8		10½	7-16	7

*N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion.* 1y24

## THE SUBSCRIBERS, AGENTS FOR RAILROAD SCALES.—THE ATTEN-

tion of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

**ELLICOTT & ABBOTT.**  
Factory, 9th street, near Coates, cor. Melon st.  
Office, No. 3 North 5th street,  
Philadelphia, Pa.

**RAILWAY IRON.—THE BEST QUALITY** of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by  
**DAVIS, BROOKS & CO.,**  
Jan. 2. [11] 68 Broad St., New York.

**SAM'L KIMBER & CO.,**  
59 North Wharves,  
Philadelphia, Pa.  
Jan. 14, 1846. [1y4]

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 30 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed.]

WILLIAM ROE, Supt. of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed.] G. A. NICOLL,

Supt. Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed.] T. L. SMITH,

Jersey City, November 4, 1845.

N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car. For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed.] JOHN LEACH,

Jamaica November 13, 1845.

1y19 Supt. Motive Power

## NICOLL'S PATENT SAFETY SWITCH

for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee

G. A. NICOLLS,

ja45

Reading, Pa.

## TO RAILROAD COMPANIES AND MANUFACTURERS OF RAILROAD MACHINERY.

The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

**THOMAS & EDMUND GEORGE,**  
ja45 N. E. cor. 19th and Market st., Philad., Pa.

## RAILROAD IRON.—THE SUBSCRIBER'S

New Rail Iron Mill at Phoenixville, Pa., is expected to be ready to go into operation by the 1st of September, and will be capable of turning out 30 to 40 tons or finished Rails per day. They are now prepared to receive orders to that extent, deliverable after the 1st of October next, for heavy rails of any pattern now in use, equal in quality and finish to best imported.

**PIG IRON.**—They are also receiving weekly 150 to 200 tons of No. 1 Phoenix Foundry Iron, well adapted for light castings.

**REEVES, BUCK & CO.,**  
45 North Water St., Philadelphia,  
or by their Agent, **ROBT. NICHOLS,**  
29t 79 Water St., New York.

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

### THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trallis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trallis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trallis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

#### ESTIMATE OF THE PROBABLE COST OF ONE MILE.

4,324 Timbers, 11 ft. long, 3 x 6 inches =	
68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	
4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,350 lbs. at 4½ cts. =	101 25
Workmanship free of patent charge =	600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

**JAMES HERRON.**

Civil Engineer and Patentee.  
No. 377 South Tenth St., Philadelphia. 334

### FRANKLIN HOUSE,

No. 103 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,

### BOSTON AND PROVIDENCE RAILROAD.

Passenger Notice. Summer Arrangement. On and after Monday, Sept. 28, 1846, the Passenger Trains will run as follows:

For New York—Night Line, via Stonington. Leaves Boston every day, but Sunday, at 5 p.m.

Accommodation Trains, leave Boston at 7½ a.m. and 3½ p.m., and Providence at 8 a.m. and 3½ p.m.

Dedham trains, leave Boston at 9 a.m.; 3 p.m., 5½ p.m., and 10½ p.m. Leave Dedham at 8 a.m. and 4½ and 9 p.m.

Stoughton trains, leave Boston at 11½ a.m. and 4-10 p.m. Leave Stoughton at 8 a.m. and 2½ p.m.

All baggage at the risk of the owners thereof.

31 ly W. RAYMOND LEE, Sup't.

### BRANCH RAILROAD AND STAGES CONNECTING WITH THE BOSTON AND PROVIDENCE RAILROAD.

Stages connect with the Accommodation trains at the Foxboro' Station, to and from Woonsocket. At the Seekonk Station, to and from Lonsdale, R. I. via Pawtucket. At the Sharon Station, to and from Walpole, Mass. And at Dedham Village Station, to and from Medford, via Medway, Mass. At Providence, to and from Bristol, via Warren, R. I. Taunton, New Bedford and Fall River cars run in connection with the accommodation trains.

### PHILADELPHIA AND READING RAILROAD.—Passenger Train Arrangement for 1847.

A Passenger Train will leave Philadelphia and Pottsville daily, except Sundays, at 9 o'clock A. M.

The Train from Philadelphia arrives at Reading at 12 18 M.

The Train from Pottsville arrives at Reading at 10 43 A. M.

Between Phila. and Pottsville, 92 Miles. No. 1. No. 2.

" Reading, 58 9-25 and 1-90

" Pottsville, 34 1-40 and 1-20

Five minutes allowed at Reading; and three at other way stations.

Passenger Depot in Philadelphia corner of Broad and Vine streets.

### LEXINGTON AND OHIO RAILROAD.

Trains leave Lexington for Frankfort daily, at 5 o'clock a.m., and 9 p.m.

Trains leave Frankfort for Lexington daily, at 8 o'clock a.m. and 9 p.m. Distance, 26 miles. Fare \$1.25.

On Sunday but one train, 5 o'clock a.m. from Lexington, and 2 o'clock p.m. from Frankfort.

The winter arrangement (after 15th September to 15th March) is 6 o'clock a.m. from Lexington, and ma. 9. from Frankfort, other hours as above.

35ly

### BOSTON AND MAINE RAILROAD.

Upper Route, to Portland and the East.

### SUMMER ARRANGEMENT,

April 1, 1847.

### PORTLAND TRAINS.

Leave Boston at 7 A.M. and 2½ P.M.

Leave Portland at 7½ A.M. and 3 P.M.

### GREAT FALLS TRAIN.

Leave Boston at 5 P.M.

Leave Great Falls at 6½ A.M.

### HAVERHILL TRAINS.

Leave Boston at 11½ A.M. and 6-20 P.M.

Leave Haverhill at 6½ A.M. and 4½ P.M.

### READING TRAINS.

Leave Boston at 8½ A.M. and 8½ P.M.

Leave Reading at 6 A.M. and 1½ P.M.

### MEDFORD BRANCH TRAINS.

Leave Boston at 7½, 11½ A.M., 2½, 5½, 7 P.M.

Leave Medford at 6½, 8 A.M., 1½, 4½, 6 P.M.

The Depot in Boston is on Haymarket Square.

Passengers are not allowed to carry Baggage above \$50 in value, and that personal, unless notice is given, and an extra amount paid, at the rate of the price of a Ticket for every \$500 additional value.

1y31 CHAS. MINOT, Sup't.

### SUMMER ARRANGEMENT.—NEW YORK AND ERIE RAILROAD LINE, from April

1st until further notice, will run daily (Sundays excepted) between the city of New York and Middletown, Goshen, and intermediate places, as follows:

FOR PASSENGERS—

Leave New York at 7 A. M. and 4 P. M.

" Middletown at 6½ A. M. and 5½ P. M.

FARE REDUCED TO \$1.25 to Middletown—way in proportion. Breakfast, supper and berths can be had on the steamboat.

FOR FREIGHT—

Leave New York at 5 P. M.

" Middletown at 12 M.

The names of the consignee and of the station where to be left, must be distinctly marked upon each article shipped. Freight not received after 5 P. M. in New York.

Apply to J. F. Clarkson, agent, at office corner of Duane and West sts. H. C. SEYMOUR, Sup't.

March 25th, 1846.

Stages run daily from Middletown, on the arrival of the afternoon train, to Milford, Carbondale, Honesdale, Montrose, Towanda, Owego, and West; also to Monticello, Windsor, Binghamton, Ithaca, etc., etc. Agent on board.

13th

### NORWICH AND WORCESTER RAILROAD.

Summer Arrangement. Change of

Hours. Commencing on

Wednesday, April 21, 1847.

Accommodation Trains, daily, (except Sunday.)

Leave Norwich, at 6 a. m., and 4½ p. m. Leave Worcester, at 6½ a. m., and 4½ p. m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston, and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 2½ p.m. train from Boston.

New York Train via Steamboat—Leave Norwich for Boston, every morning, except Monday, on the arrival of the steamboat from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 6½ p.m., daily, except Sunday, stopping at Danielsonville and Norwich.

Freight Trains daily each way, except Sunday. Leave Norwich at 7, and Worcester at 6 30 a. m. Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are Less when paid for Tickets than when paid in the Cars.

32ly J. W. STOWELL, Sup't.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention. **ANDREW C. GRAY,** a45 President of the Newcastle Manuf. Co.

**R**AILROAD IRON AND LOCOMOTIVE Tyres imported to order and constantly on hand by **A. & G. RALSTON** Mar. 20th 4 South Front St., Philadelphia. 28th

**VALUABLE PROPERTY ON THE MILL Dam For Sale.** A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 68,497 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x39 ft. with lathes, work benches, Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, turnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45½ feet two stories high, with a shed part 45½x30 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 900 feet long by 30 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to **HENRY ANDREWS, 48 State st.,** or to **CURTIS, LEAVENS & CO., 106 State st., Boston,** or to **A. & G. RALSTON & Co., Philadelphia.** ja45

**T**O RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.

PASCAL IRON WORKS.

WELDED WROUGHT IRON TUBES.

From 4 inches to 4 ft in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T, L, and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by **MORRIS, TASKER & MORRIS,** Warehouse S. E. Corner of Third & Walnut Streets, PHILADELPHIA.

**T**O LOCOMOTIVE AND MACHINE ENGINE Boiler Builders, Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

**MORRIS TASKER & MORRIS,** Warehouse S. E. corner 3d and Walnut Sts., Philadelphia.

**P**ATENT INDESTRUCTIBLE WATER Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits. This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York.

J. BALL &amp; CO.

## CRAMPTON'S IMPROVEMENTS IN LOCOMOTIVE ENGINES.

*Specification of a Patent granted to T. R. Crampton, engineer, of Adam St., Adelphi, for certain improvements in locomotive engines. Patent dated August 25, 1846. Enrolled Feb. 25, 1847.—[Patent Journal.]*

This invention comprises 16 different improvements in the working or other parts of a locomotive engine, and are as follows: According to the first part, the patentee constructs his engine with the axle of the driving wheels placed at the end of the fire box, about midway between the top of the boiler and the under side of the fire box; and in order that the distance between the extreme wheels should not be too great, he shortens the fire box in a longitudinal direction—while at the same time an increased amount of fire box surface is obtained by extending the fire box under the driving axle, and also under the body, or tubular part of the boiler, which portion he forms as near as possible of the same shape as the boiler, when it does not interfere with the axle of the running wheel; second, he combines the use of an extended fire box, under the cylindrical part or body of the boiler, with engines having the axle of the driving wheels under the boiler; the axle is placed close in the angle formed by the fire box and boiler, the fire box being curved under the axle, and is extended some distance beyond it. The advantages of this combination are, that instead of having the fire box the whole length of the bars on the end of the boiler, it may be constructed much shorter, having by that means less overhanging weight, and at the same time retain an equal area of fire box surface. The third improvement consists in placing a spring parallel to the end of the boiler for supporting it from the axle of the driving wheels when placed in that position; the advantages of which are, that the fire box may be of larger dimensions of a narrow gauge railway, than when the springs are at the sides, from the room occupied by them;

he states that he is aware that engines have before been constructed with a spring situated as herein represented, but states that it has always been in conjunction with the axle of the running wheels. Fourth, it consists in placing a spring across the body of the boiler in engines having the axle of the driving wheels placed under the boiler—the weight being supported by side rods, or supporters from the axle, to the ends of the springs—this disposition of the spring enables him to obtain more room for the pumps and other gearing, and also gives greater facility for repairing the same, when such is necessary.—Fifth, he combines the use of outside eccentrics or return cranks for working the slide valves of locomotives, with such engines as are constructed with outside cylinders and straight driving axles placed behind the fire box; the return cranks or eccentrics are represented in our front cut, and consists of an arm which returns from the main crank pin, the centre carrying a joint at its inner end, on which the eccentrics are placed—or, if used as cranks, they must terminate in a position suitable for imparting the required motion to the slide valve. The reversing gear, it will be seen, is the same as that now generally used, and will, therefore, require no explanation. The sixth improvement is a combination of the outside eccentrics or return cranks, already explained with locomotive engines having the straight axle of the driving wheels placed under the body of the boiler; the advantages of which are, that the curve, or that part of the fire box which comes near the axle, can be brought much closer together than when the eccentrics are on the driving axle when so situated. Seventh, these improvements consist in having a fire box under the axle of the driving wheels, when such axle is placed on the end of the fire box (extending as before described) by which the firing is much easier conducted; this may also

be used in conjunction with another door situated above the axle; the only alteration of the engines requisite, being the lowering of the foot plate below the level of the lowest fire door. The eighth improvement consists in placing the pumps and eccentrics for working the slide valves of locomotive engines on the outside of the framing—by which arrangement, easy access is had to the working parts, in the event of any repairs being requisite, and at the same time is always exposed to view, so that the engine driver can more easily see whether the gear is in correct working order. Ninth, he combines the use of an oval form of boiler with engines having the axle of the driving wheels placed behind the fire box—by which means he is enabled to have a boiler of much larger dimensions, where confined by the narrowness of the gauge without increasing the height of the centre of gravity by keeping the body of the same near the ground; he is aware that locomotive boilers have before been made slightly oval, perhaps to the extent of 3 or 4 in., such being considered the extent to which it could be carried without endangering the safety of the locomotive, by carrying the centre of gravity too high, the length of the oval being in the direction of its height; but by having the axle of the driving wheels situated as herein mentioned, the necessity of raising the centre of gravity is obviated by lowering the whole body of the boiler, and consequently the oval may be carried to the extent of 14 or 15 in., and even more—care being taken to strengthen it in proportion by means of stays inside the boiler. Tenth, he attaches the tender to the engine at the smoke box end, which has the effect of pushing it front; it is constructed to contain the water only, the receptacle for coke being on the top of the boiler, over the fire box: an apparatus is also constructed in connection with this arrangement, so that the engine driver can apply the

breaks to the wheels of the tender without leaving the foot plate. The eleventh improvement consists in placing the axle of the driving wheels across the end of the smoke box, the frame work being lengthened to receive support from the bearings; the effect of this will be, that the driving wheels will draw the locomotive after them. Twelfth, the arrangement of engine exhibited in the engraving, is that described under this head of the invention, and the improvement consists in combining the position of the axle of the driving wheels, with the arrangement of outside cylinders, pumps and eccentrics; the boiler has a recess formed in its upper part to receive the driving axle, whereby a boiler of moderate dimensions can be obtained without unnecessarily increasing the diameter of the driving wheels; a passage is placed across this recess above the axle for the free escape of the steam generated in the body of the boiler, into the steam chamber, the steam being carried from thence to the cylinder by the steam pipe over the body of the boiler; this arrangement affords great facilities of working and enlarging the parts, and otherwise improving the locomotive now in use on narrow gauge railways. The thirteenth head relates to the combining outside cylinders, eccentrics and pumps, with engines having the driving axle placed at the end of the extended fire box; this arrangement admits of the fire box shell being carried much closer to the axle, and thereby effecting a saving of room—and renders the whole more convenient and compact, from the absence of eccentrics on the central part of the driving axle. Fourteenth, this is a certain construction of fire box, whereby he is enabled to make the cylindrical or body part of the boiler of much larger dimensions, and consequently to contain a greater number of tubes than can be employed in any other construction of locomotive boilers adapted for a gauge of 4 feet 8½ inches; the diameter of the boiler is such as to project beyond the extreme breadth of the running wheels; the centre, or greatest breadth of the boiler is placed above the periphery of these wheels, with which it does not therefore interfere; the smoke and fire boxes have suitable segmental projections at the upper part, where they are joined to the body, and thus a greater extent of tubular surface is obtained. Fifteenth, the coupling two locomotive engines with the fire box ends together. The tender is placed at the smoke box end of one of the engines so situate, each having suitable communications for obtaining the necessary supply of water; the advantages derived from this mode of coupling being that one set of men is sufficient for the working of both engines, and thereby effecting a great saving. The receptacles for the coke are placed over their respective fire boxes, as explained in a former part of this description. The sixteenth and last improvement is for preventing the entire back surface of the slides in locomotive engines receiving the pressure of the steam, which is productive of great and unnecessary friction: he constructs the slide with a raised ridge of metal on the back part thereof, the

diameter of which is as large as can be described within the back surface of the slide; to this a thin ring or flange of sheet brass is affixed at its inner circumference, which is of a similar diameter with the projection on the back of the slide. At the extreme diameter of the brass ring, another thick ring of metal is affixed—the substance of which is just sufficient to cause it to bear upon the inside of the slide jacket, which is faced parallel with the slide face. It will be obvious that, on steam being admitted to the slide, its pressure on the corners uncovered by the spring packing, will be sufficient to keep it close to its work; while at the same time the steam acts on the ring of metal next the jacket, keeping it against that surface, and consequently preventing the pressure of the steam exerting any undue force on the slide face by excluding it from the back. The thin ring of brass admits of sufficient elasticity to allow for wear or any inequality in the rubbing surfaces. A small aperture is made in the slide jacket for the free escape of any steam which may get between it and the spring ring.

Having described the nature and advantages derived from the adoption of his improvements, he states that which he claims as new, and of his invention, is—first, the combination of an extended fire box, with a locomotive engine, having the axle of the driving wheels placed at the end of the fire box; second, an extended fire box under the cylindrical or main body of the boiler of a locomotive engine in combination with engines having the axle of the driving wheels under the boiler; third, the use of a spring placed parallel to the end of the boiler, supporting the boiler from the axle of the driving wheels; fourth, the use of a spring across the upper portion of the body of the boiler in engines having the axle of the driving wheels placed under the boiler; fifth, the use of outside eccentric or return cranks, for working the slide valves of locomotive engines in combination with engines having outside cylinders, with straight driving axles placed behind the fire box; sixth, the use of outside eccentrics in combination with engines having the straight axle of the driving wheels placed under the body of the boiler; seventh, the use of a fire door under the axle of the driving wheels; eighth, placing the pumps and eccentrics for working the slide valves of the engines outside the framing; ninth, the oval form for the body of the boiler, in combination with engines having the driving wheels placed behind the fire box; tenth, attaching the smoke box end of the engine to the tender containing the water;—eleventh, placing the axle of the driving wheels at the end of the smoke box; twelfth, the combination of outside cylinders, eccentrics and pumps, with an engine having the straight axle of the driving wheels placed in a recess in the boiler; thirteenth, the combination of outside eccentrics, cylinders and pumps, with engines having the driving axle placed at the end of the extended fire box; fourteenth, the use of a fire box with projections at the sides, adapted to receive a large diameter of boiler; fifteenth, coupling two

locomotive engines at the fire box end; sixteenth, the adaptation of a spring metallic ring to the back of the slides of locomotive engines, for the purpose of preventing the pressure of the steam on the principal part of its surface, as hereinbefore described and set forth.

Iron Manufacture.  
(Continued from page 313.)

#### APPENDIX.

In the foregoing pages we have limited our observations on the advantages arising from Mr. Wall's process to only one branch of metallurgy. One and the chief motive was, that iron, being of paramount importance, any improvement in its manufacture would be regarded as of leading interest.—The experiments also in this case were more public, in greater number and variety, and, consequently, if called in question, could more readily be traced, and the truth satisfactorily ascertained. But this mysterious agent, hitherto the mere toy and plaything of philosophers, is now brought forward as a giant of unmeasurable power. In fact, it is hardly possible to exaggerate the importance of the discovery. The following are the words of an eminent French chemist, inserted in *L'Annuaire*, May 15, 1845:

"Mr. Wall, of London, has lately patented a discovery for improvements in the manufacture of iron and other metals, which promises greater results to society at large, than anything produced in the scientific world since the introduction of the steam engine. He has ascertained that the passing of a current of electricity through a body of metal, while in a state of fusion, has the effect, not only of clearing it of all evaporative substances, as sulphur, arsenic, phosphorus, etc., but effects a change in the molecular arrangement, and imparts to it at once a ductility and strength only obtainable hitherto after tedious and expensive processes. It was the celebrated Davy who first exhibited the power of voltaic electricity, by decomposing, with its aid, bodies until then deemed pure elements. 'Such is the power,' says this illustrious chemist, 'of analysis possessed by electricity, that the most seemingly insoluble compounds such as glass, sulphate of barytes, fluor spar, cannot resist its energy. Aggregates the most adhesive, the firmest compounds are unable to withstand, but yield up their elementary bases.' The results obtained by the great philosopher have not been lost, Mr. W. has carried them forward, and rendered them available to the purposes of industry. For on a minute examination of the experiments made by the latter, we shall perceive an analogy of reasoning, and a development of the same principle. \* \* \* The advantages that this discovery must give to society, and the security of life and limb in those situations where both are daily and hourly exposed, on our railroads, as well as in steam vessels, and in machinery of every description, cannot be too well known. Mr. Wall has, we understand, obtained patents from several of the governments in Europe, and also in America. Nations the most advanced, as well as the backward in civilization, will

derive advantages from its adoption. In the former it will give a new impulse to genius and industry, to the latter it will unfold another source of light and progress.

We will not, however enter upon a fresh dissertation, nor lengthen out any further the list of testimonies, but proceed at once to a brief detail of the experiments made by the application of the process to some of the other metals.

"Titanium has been compelled to yield to this novel agent, and gives up its oxygen, hitherto refused when acted upon by most intense heat, to a stream of electricity issuing from a moderately sized battery. I submitted Titanium, says Mr. Wall, which is so called after the fabulous Titans, from its resistance to every attempt to fuse it, or change the condition in which we see it in our Museums, to a stream of voltaic electricity.— Finding by previous analysis, that some pig iron contained about eight per cent. of it, I had two bars, each two inches square, cast in sand. Through one, while in transition from the fluid to a solid state, I passed a current of electricity from a series of ten pairs of zinc and platinized silver plates, eight inches by four, for the space of half an hour. The other bar was left to cool without anything being done to it. I afterwards made a minute research on a portion (1000 grains) of each. In the electrified bar I found a dull white residue of about twelve per cent., which I took for silicon, but on a closer examination, it proved to be the oxide of titanium. I had the other bar as carefully analyzed, and found eight per cent. pure brilliant titanium along with silicon, without the least change either from the action of the fire or the acids. Thus this extraordinary metal gives up, in thirty minutes, its oxygen, which it has refused, though acted upon for years by the concentrated power of a huge blast furnace."— Results equally satisfactory followed experiments made on manganese, from which the oxygen was separated in the space of a few minutes. Copper, also, which refuses to part with its alloys, either to the scientific efforts of ingenuity, or the power of the refining fire, except at a great loss of the metal itself, is cleared of the sulphur, arsenic, etc., in less than an hour, even when opposing a mass of eight or ten tons to the action of the electric battery. Nor is any loss sustained by the metal beyond the riddance of those deteriorating associates: while it is rendered, as is obvious, more durable than the copper manufactured by the ordinary process. For to avoid the loss inevitably resulting from a prolonged attempt at purification, a great portion of alloy is generally left, forming, in conjunction with the metal, a sort of voltaic battery, which immersed as it were in a menstrum formed by the air and water, particularly salt water, operates a speedy dissolution. All the other metals are in like manner purified and rendered more serviceable for their different purposes by this beneficial agent. It is evident, also, how practically the above experiments confirm the theory of Sir H. Davy, develop the principles of electro chemical science, and establish the agency of the

voltaic battery, as an instrument of analysis. Indeed, as a mode of analysis, we may, on a review of the above experiments, be allowed to indulge in the proximate realization of the hope expressed by that great man, 'that it may lead us to the discovery of the true elements of bodies, if the materials acted upon be in a certain state of concentration, and the electricity be sufficiently exalted. For if chemical union, he adds, be of the nature I have ventured to suppose, however strong the natural energies of the elements of bodies may be, yet there is every probability of a limit to their strength; whereas, the powers of our artificial instruments seem capable of infinite increase.'

#### BATTERIES, CONSTRUCTION AND MANAGEMENT.

As may be supposed, in the machinery used by manufacturing establishments, particularly those of iron, where everything is on so large a scale, the chief aim is to combine efficiency of operations with facility of management. On the other hand, science, thro' a morbid jealousy, and puerile assumption of dignity, delights in the use of mysterious terms, and too often endeavors to throw around trifles a fictitious importance, by means of pompous designations. What's in a name? may be asked; much, it will be answered, when the question refers to the rejection or adoption, the retarding or acceleration of any measure, dependant on the co-operation of untutored agents. Electricity, and electrical batteries are looked upon by the rough attendants of the puddling furnace and the rolling mill, as some strange and complicated machinery, adapted only for the cabinets of the theorist and philosopher.

The batteries, which Mr. Wall had till lately made use of in his process, were those adopted by modern science, and which, although very efficient, and easily managed by himself, he found to be too abstruse in principle, and too intricate in their construction for the generality of the workmen, and required a nicety of attention he could not succeed in obtaining. The circumstance proved a source of great anxiety, and frequent disappointment. Actuated by that great unobtrusive spirit, which is ever characteristic of true inventive genius, and which imagines, that what shines so clear to its own sight, cannot be hidden from others, he too often acquiesced in the co-operation of assistants, whose knowledge of electricity extended not beyond the mechanical arrangement of the battery, or, perhaps, more accurately, a *hobby* experience of its effects. An essential requisite might be absent, and it would not be missed; a material derangement might occur, and it would not be noticed. Instead of the alternate position of zinc and copper, a plate of zinc would be associated, side by side, with another of zinc, or copper with copper; or by the accumulation of zinc on the silver, the action would be confined to the cells, without the semblance of a spark at the poles. Other incidents would occur, still more strongly illustrating the inconvenience and risk attending the frequent arranging and taking down indispensable in the employment of the ordinary batteries. The iron bars, to which were

attached the pole wires, would sometimes be driven in heedlessly of direction, so as to come in contact with the tympan plates, which proving better conductors than the melting mass, would carry off the electricity. At other times the bar did not touch the metal, but was placed underneath, upon the damp plate, or, perhaps, only inserted partially in the clay stopping of the tap hole, without reaching the metal within the furnace. Such untoward occurrences required no ordinary forbearance, and only a mind deeply impressed with the value of the discovery would have persevered. The consequences, however, as affecting the claims of the process, and its adoption may be easily guessed; and prejudice, ever on the watch against any innovation in its long cherished system, was not slow to take advantage of the opportunity thus afforded. In several instances, where the indiscriminate apprehension, so commonly entertained by the workmen, against any improvement could be enlisted, the *new project*, as it was termed, was discontinued, and its expulsion from the works effected. It was represented as a mere amusement for science, a costly toy, fit to divert the Hall of the Royal Society, but of too delicate a structure for the rough hands of gaffers and puddlers. It might be plausible in theory, but it was not practicable. Its adoption would necessitate the engaging of a professed philosopher in every iron establishment, for the purpose of superintending its operations: and why derange the existing and long proved order of such colossal works for a something, on the results of which no reliance after all could be placed. Happily these objections have been removed. Mr. Wall has constructed a battery of the simplest form, which requires only the most ordinary knowledge and attention to arrange it; obviating all escape of electricity, and securing a full and unrestricted action. In it are dispensed with, that multiplicity of small plates, which required such nicety of arrangement, and which a slight agitation would disturb: and one continuous surface is exposed to the menstrum. From the peculiar arrangement also of the plates, and the increased extent of surface, the stimulents are not obliged to be so powerful. This battery may be placed in any part of the premises, and remain as a fixture, thus precluding the necessity of taking down and re-fixing, which is so annoying to the workmen, and incurs a risk of a misplacing of the bars, etc. Instead of the bars also being inserted anew in the tap hole or tuyere of the furnace an hour before each tapping, as in the case of other batteries, they are made fast to the back part or side of the tuyere in such a manner, that even in the event of their ends being burnt off, or other casualty, no interference takes place with regard to the effects produced within, provided the wires issuing from the battery remain attached. The same arrangement is made in front or on one side of the tap hole. The commonest workman, or boy, with sense enough to turn a screw backwards and forward, may put it in operation, and manage it with the greatest ease. A battery of this description, capable of acting efficiently on eight

to ten tons of fused metal at a time, does not exceed one-fifth of the price of a Smee's battery of one hundred pairs, eight by three and a half inches. Nor do these advantages of Mr. Wall's new battery interfere with its adaption to temporary operations, or render it less convenient for removal. It is already in use at some of the great iron works on the continent, where it has met with general approval. The description accompanying the drawing of this simple and efficient machine, both of which may be sent, on application from parties desirous of a license of the patent, will enable any ordinary workman to arrange it for operations, without any further assistance.

[The following Theory possesses such strong features of originality, and at the same time, appears so probable, that we cannot forbear giving it publicity. It will, moreover, further illustrate the magnitude of the power whose operations we have been narrating.—This universal agent, is seen by Mr. Wall in every change, chemical or physical, occurring in inert or active matter. The minutest particles, as well as the most gigantic aggregations possess their relative electric quantities, and in the event of any excess or diminution are thrown into a state of excitement, and so continue until the balance is restored.]

#### ON THE FORMATION OF AEROLITHES IN CONNECTION WITH ELECTRICITY.—BY MR. WALL.

The electrical phenomena invariably coincident with volcanic eruptions, seem to have almost escaped notice, or at least, have been but slightly touched upon by philosophers. It appears to have been hitherto regarded as a something, surrounded by an inviolable mystery, repelling all approach of conjecture or discussion. It may have glared for a moment before the eye of the mind, but like the meteor itself, the impression has been but transient; it has passed on unexplained and forgotten. Although the theory which I here advance, may not ensure immediate conviction of its truth, I think there will be found strong features of probability. The hypothesis does not assume the existence of any properties of electricity, not previously recognised and already familiar to the experimentalist. The principles are obvious and require little elucidation to bring them within the reach of the most ordinary understanding. During the last two years, I have been engaged in realizing a plan I had discovered, for the application of voltaic electricity, in the manufacture of metals. The experiments which in great number and variety have been made at the great iron establishments throughout this country, and on the continent, have proved eminently successful, and respectable and competent witnesses have recorded their approval of the efficiency and utility of the process. During the course of those experiments, several phenomena occurred particularly interesting and illustrative of conjectures, which I had previously entertained respecting the nature and formation of meteoric bodies. These brilliant masses, which occasionally rush through our atmosphere, strik-

ing terror into the minds of the ignorant and superstitious, are supposed by some to be fragments of planets, disrupted, and thrown off by some violent concussion, or hurled from the volcanoes, reported to exist in the moon. I think, however on a closer view, we shall not be at a loss to find materials on our own earth, abundantly sufficient for the formation of these strange visitors, without being obliged to suppose them to have taken so long a journey. They are known to exist of an alloy of iron, with some nickel and chrome, with traces of other metals, and are generally invested with a vitreous glaze of earthy matter. The features evidently denote a volcanic origin, while I dispute the claims attributed to the volcanoes of the moon, as our own globe was not destitute of these apparently indispensable characteristics of a material world. These volcanoes, placed as they are in different parts of the earth, are doubtlessly its safety valves, and allow vent for those immense and eternal fires, which in the wise economy of nature are known to exist in the centre of the earth. Confirmatory of the view here taken of the purposes of these volcanoes, there is a circumstance worthy of notice. On examination of the dates of different eruptions, it has been a subject of remark, that the occurrences have taken place at alternately distinct periods. Thus, while the volcanoes at the two poles have been in agitation, those in the vicinity of the equator or in the intermediate zones, as Vesuvius, *Ætna*, etc., were in comparatively a quiescent state, and vice versa. But to proceed. It is natural to suppose that fires, such as those in the centre of the earth, reduce the ores, with which they come in contact, into a metallic state, and thus afford the supply of magnetic or electrical power to the atmosphere through the channel or vent allowed by the volcanoes. Hence the vast electro magnetic concentration found to exist in the neighborhood of volcanic mountains, and which, in its intensity, is ever proportionate to the actual state of agitation or rest in the volcano. It is well known to those conversant with the operations of a foundry, and acquainted with the properties of heat, that portions of the most ponderous metals, when in combination with other matter of a volatile nature, are eliminated and dissipated like steam. While, therefore, fusion is progressing in these vast subterranean furnaces, iron in alloy with carbon and sulphur, and the semi-metals sure to be found there in excess, is carried off in minute particles, and, finding egress through the volcanic crater, is borne aloft simultaneously with the free carbon issuing in the form of smoke. But, notwithstanding the extremely minute division which has taken place, the nature of the affinities of these metallic atoms, remains unaltered, and they will coalesce on the first occasion which offers for a reunion. As long as the atmosphere continues in one uniform settled state, no change in their condition takes place; but one that the electric fluid, still pervading them, and holding them in the same, however extended, but continuous bond becomes disturbed, whether from excitation or alteration

in the equilibrium of the positive and negative conditions, then the power which has kept them in a state of separation is overcome, and the atoms rush again into union. The phenomena indicative or at least coincident with such an occurrence, are strikingly observable. Whether formed from the vapors ascending from the earth, or the accumulation of evaporative matter of volcanoes, clouds of huge magnitude, and of a dark and lowering aspect, stretch athwart the heavens in irregular but determinate course towards the rendezvous, where their operations are about to commence. In these threatening masses of clouds, considerable friction or attrition takes place from the force of the winds, etc. While these forces are thus, as it were, preparing for the assault, a strong commotion is perceptible, which is nothing more than an adjustment of power, producing in the act of obtaining a due balance, the lightning flash, and thunder. The metallic particles are thrown into agitation, their affinities are excited, and they rush together. Thus, again united, they form a body outweighing the specific gravity of the atmosphere, and are consequently borne to the earth in the form so well known as thunderbolts, or meteors. The carbon, sulphur and phosphorus, and the other alloys, are at the same time combined, and accelerate and augment the ignition of the fiery ball in its course towards the earth; this course, although doubtless modified by accidental circumstances, has been generally remarked as bearing on an angle of forty-five along a meridian from north to south. These meteors often travel to a great distance, and fall in parts where there are no appearances of storm, or any change in the atmosphere. These remarks may not, as I before observed, be deemed conclusive, or sufficiently strong to establish the theory here brought forward; they are, in truth, from a conscious inability in expressing my ideas, merely thrown out as inducements to inquiry, and to elicit the opinions of others, far more competent to elucidate and decide on a subject, unquestionably interesting.

N.B. Though perhaps, not directly bearing upon the subject, above treated, I will note down another conjecture. May not the zigzag tracings observed on the magnetic chart, be attributed to the electric currents taking their course towards the various volcanic inlets, which give them the readiest access to the grand source of electro magnetic power, situated in the centre of the earth?

The total inefficiency of the compass, occurring about the latitude of sixty-seven degrees, are familiar to the navigator. It is probable that this instrument, dependant as it is on the electro agency so variously distributed throughout the globe, having passed beyond the range of the volcanic concentration of the electro magnetic power, becomes, in a manner paralyzed, or incapable of a fixed determinative direction. Electricity, is indeed present and continues to the pole itself, but in a comparatively dormant state, the eternal snows opposing an insurmountable barrier, to all excitation, or disturbance of equilibrium.

Correspondents will oblige us by sending in their communications by Tuesday morning at latest.

AMERICAN RAILROAD JOURNAL.

Published by D. K. MINOR, 108 Chestnut St., Philadelphia.

Saturday, May 23, 1847.

**NOTICE TO CONTRACTORS.—ANDROS-COGGIN AND KENNEBEC RAILROAD.** Proposals will be received at the Railroad Office, in Lewiston, until the 17th of June next, for the Grading and Masonry of the 1st Division of the Road, extending from the Atlantic and St. Lawrence Road in Danville, to Green centre, 14½ miles.

Also, separately, for the Masonry and Woodwork of the Bridges across the Great and Little Andros-coggin Rivers, the Bridges to be constructed on Towne's plan.

Plans and Profiles will be ready for examination, and the route shown, on and after the 10th of June.

Satisfactory securities will be required of bidders unknown to the officers of the company.

The 2d Division, extending to Snow's Pond in Belgrade, 25 miles, will be ready for contract about the 25th of July; and the remainder of the road to Waterville, about the 20th of September.

HOBART CLARK, Agent A. & K. R. R.  
EDWARD APPLETON, Engineer.

Railroad Office, Lewiston, May 8, 1847. 4t21

**THE SUBSCRIBER** has on hand a good assortment of his best Leveling and Surveying Instruments, among them his improved Compass for taking angles without the needle—also Bells, suitable for Churches, Railroad Depots, etc.

ANDREW MENEELY.  
West Troy, May 12, 1847. 1y-21

Railroad to the Pacific.

We commence, in this day's Journal, the Speech of MR. WHITNEY, (delivered in the New York Assembly Chamber on the 30th ult.) upon his great scheme for a railroad to the Pacific. We shall publish it entire—as we believe it contains much information that will be readily appreciated, and because it gives the views of Mr. W. at length, upon his favorite plan for this immense work—which, at some day or other, will, without doubt, be accomplished—whatever may be the opinions in reference to it. We commend the Address to the notice of our readers.

Table of Railroads—Its Corrections, etc.

Thanks to the writer of the following letter, as it gives precisely the information desired to make the Table of American Railroads what we wish. It is dated "Transportation Office, Georgia Railroad and Banking Company, Augusta, Ga., May 1st, 1847," and says:

"DEAR SIR: In your Table of Railroads, 'No 127, Georgia,' please change the Revenue for 1845 to \$315,341 59, gross—and \$179,137 85, net. The Revenue for 1846 is—gross, \$409,935 46—net, \$252,033 10. A Commutation is allowed."

"The western terminus of the Western and Atlantic railroad, (No. 130) should now be entered

Dalton, instead of 'Oothcaloga;' the length 100 miles, instead of '80;' the maximum grade 33 feet, instead of '30;' and the fare per mile 5 cts., instead of '5½.'

"Another railroad, which you have not noticed, called Memphis Branch railroad, is in the process of construction, and will be put in operation in less than one year, from Kingston, Ga., to Rome, Ga.—Length, 17 miles; flat bar, 21 x 8; single track."

"Respectfully your obedient servant,  
"F. C. ARMS."

Niagara Suspension Bridge.

The following are the estimates of the revenue which it is supposed this work will yield when completed:

"In furtherance of the proposals that have been made for the erection of the bridge, capable of sustaining cars, etc., equal to 500 tons weight, at a cost of \$200,000, the following estimate has been made to show the advantage of the projected work, as a profitable investment of capital. To the estimated cost of construction, we may add \$25,000 more, to purchase land, buildings, etc., making the total cost of bridge, etc., \$225,000. It is estimated that the Lake passengers, to and from Buffalo, amount to 1,000,000 yearly. Assuming that one-fifth of the number going to and fro, should cross the suspension bridge and Great Western railroad, the number thus given, would be.....200,000

Add for visitors to the Falls and local travelers.....100,000

Probable number of travellers who would cross the bridge in a year.....300,000

Receipts from 300,000, at 12½ cents each...\$37,500

Merchandise, cattle, etc., say.....12,500

Probable revenue of the bridge.....\$50,000

Which, on the cost of \$225,000, would be over 52 per cent."

Iron in Alabama.

We learn from the Tuscaloosa Monitor, that a bloomery will soon be established near that city, for the manufacture of hollow ware and other descriptions of iron castings. In Bibb, Shelby and Talladega counties, bloomeries and forges have been in operation for some time; in the two former for a number of years—and the results so far are highly encouraging. The Monitor states that beds of the finest ore are found to an incalculable extent in Tuscaloosa county, and it is ascertained to be superior to any in the south or west. An ironmaster of Tennessee gives it the preference both for quantity and quality.

Outlet Lock at New Hope.

We learn from the Trenton State Gazette that the long desired communication between the Delaware Division of the Pennsylvania Canal, and the Feeder of the Delaware and Raritan Canal is about to be effected. It will contribute in no small degree, to the prosperity of this city, of the Delaware and Raritan Canal, and of the Lehigh Coal Companies.

The Pennsylvania Canal Commissioners were required, by an act passed in April, 1846, to make an outlet lock near Well's Falls, as soon as \$20,000 should be loaned the State for that purpose, at an interest of 5 per cent. to be paid out of a revenue raised by a toll of \$1 on every boat passing through the lock. The loan has been raised, and the construction of the lock commenced.

The Delaware and Raritan Canal Company have also begun to make a corresponding lock in their feeder, opposite this outlet lock; and boats can cross the river from one lock to the other. A few rocks

only must be blown out of the way. A dam, however, would have been better, but our legislature has refused to consent to its construction.

This improvement will shorten the distance from New Hope to Trenton, 26 miles, and make a saving of 52 miles in each trip of every boat from the Lehigh to New York and back. It will save the detention now caused by passing 14 locks twice, and the expense of steam-towing between Bristol and Bordentown. Each trip will, it is supposed, be shortened three or four days. A large portion of the trade of the Lehigh will take this course to New York, and the revenues of the state and the canal company be materially increased. Our farmers up and near our canal will feel the advantage too, of a direct communication with the lime-kilns on the Pennsylvania Canal.

We have not learned at what time this improvement will be completed, but presume it will be finished within this year.

Ocean Steam Navigation.

The New York Herald says the splendid steamship Washington is completed in all her parts, and will sail from that port on the first proximo, with a goodly number of passengers, among whom will be the Hon. Richard Rush, our newly appointed Minister to France, several other distinguished gentlemen, and as much freight as she can carry.

The Washington is the pioneer of the first American line, which will consist of four vessels in all, each equal in every respect to the Washington. The building of the second is progressing with due speed, and before the year 1848 all of them will have been completed, and running between New York and Southampton, and Bremen.

The first day of June, we have said, is the day fixed for the Washington to sail. On the same day, one of the new French line of steamers will leave Havre for New York. This latter line will also be composed of four vessels; so that these two lines will compose eight vessels plying directly to that port, commencing on the first of next month. After these lines will have been in operation, we shall have the new Cunard line, and the new American line, of which E. K. Collins, Esq. is the principal, each of which will be composed of four vessels likewise. These will commence early in the year 1848.

RECAPITULATION.

Ocean Steam Navigation Co.,	4
French line,	4
Collins' line,	4
New Canard line,	4

Total number of steamers, - - - 16

Thus, sixteen steamers will ply regularly between the port of New York and the old world, by which we will have a weekly communication with England, France, and other countries, independent of the Boston line of four steamers.

Telegraph to New Orleans.

The agent of the Telegraph line from Washington City to New Orleans, has arrived at the latter place, with an engineer, after having examined the route between that place and Mobile, and the work will be commenced immediately, with a strong force of laborers—the wire cord and other materials are in a state of preparation, and will shortly be shipped at New York.

The State of Virginia has, by a Legislative act, subscribed for \$30,000 of the stock, and the contractors have arranged with the board of public works, to construct the work through the State to the North Carolina line along the railroads. The work is rapidly progressing through the State of North and

South Carolina, where a large force is engaged on the different sections.

#### James River and Kanawha Company.

At an adjourned meeting of the Stockholders of the above company, held on Friday evening last, it was resolved and adopted, as we learn from the Richmond Times, that the salary of the President be reduced from \$2500 and travelling expenses, to \$2000. That the salary of the Secretary be reduced from \$2000 to \$1500. That the salary of the Assistant Clerk be reduced from \$900 to \$500. That the salary of the Chief Engineer be \$3500, and travelling expenses.

Major Walter Gwynn was elected Chief Engineer. Mr. Wm. B. Chittenden was unanimously elected President. Mr. C. O. Gerberding was unanimously elected Secretary of the Company in place of Mr. Chittenden, chosen President.

An interesting discussion took place on the subject of the salary of the President and Chief Engineer, and the propriety of conferring both offices on the same person. It was finally decided, as the resolutions indicate, to separate the offices.

#### Tunnelling the St. Lawrence River.

The railroad from Boston to Ogdensburg will cross Lake Champlain at Rouse's Point—near the Canada line—by a bridge 3,880 feet, the longest ever projected in this country. The depth of water will not exceed 90 feet. After reaching Missisquoi Bay the road will run to the village of Swanton, and thence through St. Albans, to Burlington, where it will form a junction with the two roads now building to connect that place with Boston. Rouse's Point is 90 miles distant from the St. John's railroad at Laprairie opposite Montreal. The two roads can easily be united by an easy grade.

"With a view of connecting Montreal with the Boston road"—says a late number of the Monroe Democrat—"a charter was granted a year since to build a bridge over the narrowest part of the St. Lawrence, 1,500 feet long, and of sufficient height to allow vessels to pass beneath. Many persons in Montreal, well qualified to judge, suppose this to be impossible on account of the great height, the rapid current of the river, which runs at the rate of six miles an hour, and the rush of ice in the spring.—The cost will not be less than one million of dollars. The feasibility of this project has caused much discussion in Montreal, and given rise to a new plan of avoiding the river by a tunnel, the feasibility of which can scarcely be doubted, as the bottom is of rock, that can be easily worked. Tunnelling is common in Europe, where many canals and railroads pass through hills and under streams. In this country, the Baltimore and Ohio, as well as the Albany and Boston railroads, pass through tunnels. The first tunnel made in England was constructed by Brinley, who ran a canal through a hill uniting the valley of the Weaver with that of the Trent. The work was so constructed that only small boats could be propelled by the boatmen lying on their backs and pushing along with their feet. It was, however, a great improvement on the pack horse system of passing the mountains.

"There is at Worsley a canal under ground nine miles long, the termination of which is in the coal mines. When the Duke of New Castle was constructing it, the people thought him insane; but it has yielded a handsome income on its cost. The first tunnel, properly speaking, on a large scale, was made by the Liverpool and Manchester railway company, under the direction of the well known engineer, Stephenson. It is 2,750 feet long, 25 wide,

and 25 high. After that was completed, tunnels became common. The longest in the world, is on the Manchester and Leeds railway, through a chain of mountains, familiarly called the 'Backbone of England.' How to cross this chain, was a problem from the days of the Romans, down to the time that the company referred to, bored them through with a tunnel two and a half miles long, cut most of the way through solid rock. Above the opening, the mountain is, in many places, 800 to 1000 feet high. The Lancashire and Carlisle road passes through a tunnel, the construction of which is considered the great achievement of the age in this species of engineering, on account of the solidity of the rock bored through.

"The proposed tunnel, under the St. Lawrence, at its narrowest part, near St. Helen's Island, will be about one-third of a mile from shore to shore, and about one-third the length of the principal tunnels in England. The depth of the water in the river above is 43 feet. The work would be an achievement creditable to Canadian enterprise; and we have no doubt, from the spirit manifested already, that the project will be carried into effect."

#### Railroads in Massachusetts.

Twenty years ago, Mr. NATHAN HALE, Editor of the Boston Daily Advertiser, wrote a series of articles on railroads, showing their superiority to all other modes of travel, both for freight and passengers—their importance in reviving the declining trade of that city—and the certainty of their proving a safe investment for capitalists. For a year or two the subject met with no favor in any quarter. It was considered so visionary and ridiculous, that it was difficult for two persons to discuss it face to face without laughing. When the Legislature met, a progressive member from Lowell, with great presumption, moved the appointment of a committee to inquire into the expediency of surveying a route for a railroad between Boston and Lowell. It was received with all sorts of scoffs, gibes and ridicule.—One "country member" moved to amend it, by adding another survey from Boston to the moon, the latter being considered quite as feasible and important as the other. The Legislature was inexorable, and refused to grant a cent for any surveys. To quiet the clamors of some half-dozen of what were considered very fussy individuals, they were sanctioned as a sort of self-appointed committee, to collect facts on the subject at their own expense, and report to the next Legislature.

During the summer the committee were industriously engaged—the successful opening of the Birmingham and Manchester railway arrested public attention—Mr. Hale devoted his talents, and a liberal portion of his paper, to urging the importance of the subject, and as the Daily Advertiser was an old conservative journal, considered generally infallible by capitalists, the project gradually appeared more reasonable; and at the next session of the Legislature, a company was incorporated to construct a railroad from Boston to Worcester, and Mr. Nathan Hale was elected its first President. After numerous delays, disappointments, and attempts by many of the discouraged stockholders, to discontinue or suspend the work, during the financial embarrassments that followed General Jackson's "removal of the deposits," it was opened on the 6th of July, 1835, and the most brilliant results followed. A new company was incorporated, which pushed it on to Springfield, and eventually to Albany; and other lines were rapidly formed to Lowell, Providence, Portland, etc., diverging from Boston as a centre, to almost every point in the compass.

There are now fifteen different railroad companies in the State, owning 710 miles of road, built at a cost of about \$30,000,000, each paying dividends ranging from six to ten per cent. per annum. The stocks of railroads have the preference by all classes who are seeking to make permanent investments.—Their stupendous results in a pecuniary, moral and social point of view, are too well known to require a remark.

#### Copper Mines in New Jersey.

The immense stores of mineral wealth in our country are being daily brought to light, and the subject has already excited much interesting research and scientific attention. The great copper beds of the northern lakes bid fair to produce millions to the government, under the recent action of Congress, and we perceive that the Canadian Parliament has adopted a system of regulations looking to the encouragement of enterprise in opening mines on the British side.

Recent operations, says the Pennsylvanian, have opened the eyes of capitalists to the mineral wealth of our immediate sister State, New Jersey. We have already alluded to the Flemington copper mines, now in successful operation, and in the hands of the present company, promising to be a most valuable investment. An article in the New York Tribune, gives a graphic and interesting description of a discovery recently made in another section of the same state, based upon a recent visit to the spot, made by the editor of that paper, Mr. Greeley, whose opinions, we believe to be honest and sincere. He has taken great pains to examine the Allegheny mines, and his report is certainly very flattering.—To all who have any desire to embark in such an investment, opinion like this is useful in the extreme—for there is often too little examination and prudence, and too much disposition to be carried away by a desire to amass large profits at once.

We understand that specimens of the Allegheny copper ore have been smelted at Flemington, which have produced over 39 per cent. Several of our scientific men have made essays, and with most flattering results.

While upon this subject, the following from the North American, of a late date, may be interesting:

"As there appears to be a good deal of anxiety in regard to copper mines at present, we give the following from the Tribune, copied by that Journal from a London paper. In speaking of the discoveries of gun cotton, and the use of ether in surgical operations, the editor says:

"The third discovery of 1846, is perhaps even of greater importance than either of the former. We allude to the lately patented process for smelting copper, by means of electricity. The effect of this change will be quite prodigious. It produces, in less than two days, what the old process required three weeks to effect. And the saving of fuel is so vast, that in Swansea alone the smelters estimate their annual saving in coals at no less than five hundred thousand pounds. Hence it is clear that the price of copper must be so enormously reduced as to bring it into use for a variety of purposes from which its cost at present excludes it.

"The facility and cheapness of the process, too, will enable the ore to be largely smelted on the spot. The Cornish mine proprietors are anxiously expecting the moment when they can bring the ore which lay in the mine yesterday, into a state to be sent to market to-morrow; and this at the very mouth of the mine."

"This discovery will be very valuable here if the mines in New Jersey prove productive and lasting. We see, by the way, that the editor of the Tribune has just paid a visit to the Allegheny copper mine, and has returned with a good opinion of it."

## MASSACHUSETTS ANNUAL RAILROAD REPORTS.

Return of the New Bedford and Taunton R.R., under the Act of April 16, 1846.

The company are now relaying the sleepers on the road, and have contracted for a number of new passenger and freight cars.

No fatal accident has occurred to any passenger, or other person, during the year.—

One passenger only has been injured, caused by his attempt to enter the cars while in motion; being a poor man, travelling with his family, the company voluntarily paid the expense for board and physician's bills, until his recovery.

The directors have returned, as far as they are able, from the books of the company, all the items required by the act of April 16th, 1846. They find it impracticable to return in detail, other items required by said act, for the reason that the accounts and records of the company have not been kept with a view of ever being called upon to answer such minute inquiries. All which is respectfully submitted.

David R. Greene, Ward M. Parker, Thomas Mandell, Matthew Luce.

#### Railroad to the Pacific.

[From the Albany Evening Journal.]

SPEECH OF MR. WHITNEY.

The following is a sketch of Mr. WHITNEY's remarks in the Assembly Chamber, on the evening of the 30th inst.—

The object of my having asked this indulgence, gentlemen, is, that I might have an opportunity of explaining to you a project for a Railroad from Lake Michigan to the Pacific Ocean. I will first give the progress of this project. It has been before the public for nearly three years. I presented a memorial to the last session of 28th Congress, praying for a grant of the public land sixty miles wide from Lake Michigan to the Ocean, with which, by sale and settlement, to build this road. A committee of that body gave a unanimous report in its favor, recommending it to the people, and recommending the public lands as the only means for such a work. During the summer of 1845, I explored and examined a part of the route. My object, to examine the soil and surface, and ascertain what part of the route (then not fully known) was feasible for a road, if the lands would be likely to sell and settle, and produce means for the work; if material, timber, stone, etc., could be had on the route, and if the streams could be bridged, and where. The soil and surface far exceeded my expectations; timber on the border of the Lake, and a little 90 miles west of the Mississippi; then none on to the Rocky Mountains. The streams can be bridged; the Mississippi at or near Prairie du Chene, and the Missouri at above Council Bluffs, but at no place below that point.

At the commencement of the 29th Congress I again present a memorial, praying the same object, which memorial was referred to the committee on public lands in the Senate; the subject was thoroughly examined in all its bearings, and the committee unanimously reported in its favor, and introduced a bill, granting the land prayed for; the bill passed to a second reading, and ordered printed with the report. No further action had at that session. During the last

session, the committee, though composed in part of different members, was unanimous in its favor; but it being a short session, the Mexican war and other exciting subjects, prevented action. Strong expressions in its favor have been made throughout the country by the Public Press almost universally, by public meetings in many of our large cities, and resolutions by Legislatures of several States. Yet the work is so large, promising such vast results, that the mind in many instances is frightened from a fair investigation of the project and the simplicity of the work itself. I start upon the ground that no work, no enterprise, is too great, too magnificent, when dependent alone upon the labor of man for its accomplishment, furnishing itself the sure and sufficient reward for that labor. I will now, gentlemen, proceed in my plain and simple business manner (as you will have perceived I am not a public speaker) to explain this great project; a work promising such vast results as to almost overwhelm the mind; yet I hope to make it appear plain and simple.

The first consideration for any work or project is its feasibility and means to carry it out.

Its feasibility I will first explain. We all know the topography of the Mississippi Valley or Basin, that from the great Lakes to the Gulf, and from the Rocky Mountains to the base of the Alleghenies, is one inclined plain, without rock, mountain, or even hill, and without impediment to the construction of a road, except where the streams cannot be bridged, and where the bottom lands are too wide and too soft for such a work.

From the Lake to the Pass in the mountains a road may be built on a straight line by compass if you please; from the Lake to the Mississippi the grade for any one mile would not exceed 25 feet—thence to the Pass the average is about 6 feet—thence to the ocean the route is more difficult though perfectly feasible; as was shown from the Senate's committee report, taken from the report of Colonel Fremont, who measured the elevations daily from the Missouri to the navigable waters of the Columbia River; and from other travellers, from which Mr. Whitney read extracts, full and clear, showing the route to be feasible, as by the words of the committee:—"A consideration of the facts in the premises, therefore, leaves no doubt of the practicability of the proposed route for a Railroad from the shore of Lake Michigan to the navigable waters of the Columbia River." He said, this point seems settled. The means for the accomplishment of the work. It is not at all probable that Congress will ever appropriate money for such a work; and there are serious objections to the carrying on of such a work by the Government. In the first place it would require years to complete a survey, and then the route must be fixed upon by Congress, and most likely the work would never be commenced, and surely, like the Cumberland Road, never completed. I do not ask or require a survey—I do not ask for one dollar of money—and can commence the work as soon as the

grant is made. The route from the Lake to the River could be fixed upon and the work commenced without delay; to the mountains the route well known; and while the work is progressing from the Lake the entire route could be examined, surveyed and fixed upon.

It is a work beyond the power of individual enterprise, nor can it be done by States not formed. An entire wilderness, it becomes absolutely necessary to connect the settlement of the country with the building of the road.

I have sought, and believe have matured a plan which shall leave with Congress the power of control, and of holding all its security, making it a national road, while at the same time the work could be carried on as an individual enterprise, freed from the immense government patronage, which, as a government work it would create, and, also, freed from the delays, expenses, and insurmountable difficulties sure to arise from constant Legislative changes of direction. I ask Congress to set apart (not grant to me) 60 miles wide of public land from Lake Michigan to the Pacific Ocean, for this especial purpose. I make the starting point from the Lake because, first, as the road would add value to the lands; and, as the land is the only source of means, the road must be located where the land on its line could be applicable to it. Land distant from the road could not be made available, and therefore the project would fail.

There are other important reasons why this should be the starting point. It is all important to have a cheap and direct water communication with the Atlantic, while the road is being built, to take laborers, settlers and materials to the starting point; to have easy communication with a settled country around, to furnish food for the laborers and settlers. It is necessary to have timber and other material convenient; and there is timber on the borders of the Lake, and could be taken on by the road; but from any other starting point on either the Mississippi or Missouri rivers, the difference in cost of transportation for the material alone forbid the commencement of the work. And it is all-important that the starting point should be from where timber can be taken by the road for the settlers, for buildings and fences; for that immense distance of 1,200 miles where there is none, and could not be got there except by the road. From the Lake to the Mississippi, somewhere between Milwaukee and Green Bay, nearly the 60 miles wide can be found unoccupied.

From the Mississippi through to the ocean an entire wilderness. From the Lake onward for 800 miles, the land is of the very best quality for the production of breadstuffs, the surface beautiful, without rock or mountain, or even hill, just enough rolling and descending to let the water off, all covered with a rich grass for grazing or harvest, and enough for millions of cattle; no preparation wanted for a crop; the farmer wants but the plough, the seed, the scythe, and the sickle. About 300 miles of this 800, except on the border of the lake, there is timber only sufficient for agricultural purposes, buildings and

fences, the other 500 miles, and so onward to the mountains, entirely without timber, but as there is an abundance of coal all to the mountain, and timber in the northern part of Wisconsin, it can be taken on by the road at low tolls sufficient for building and fences, to places where there is none, cheaper than the land could be cleared; so that for settlers, particularly those from Europe, with the road, it is better without than with timber, but without the road can never be settled. After the 800 miles to the pass in the mountains, the land is represented as very poor, but I am inclined to believe the facilities which the road would create must render a part of it productive and useful.

From the Pass to the Ocean, I am disposed, from the information I have been able to procure, to believe there are more lands suitable for culture and grazing than we have inferred from different writers.

It is estimated that the road will be, from the Lake to the Ocean, 2,400 miles; that it will cost for a good road, heavy rail, \$20,000 per mile, and except this side the Missouri, cannot produce any income until all is completed, and must be kept in operation, for its own use, will cost, operations, repairs and all, when completed, \$70,000,000—the 2400 miles, by 60 wide, together 92,160,000 acres, one half of which is considered as worth little or nothing without the road, but it is believed the road will enhance the value so as to produce the sum required. This, then, gentlemen, is the capital stock for this great work, to be brought into life and use by the work itself.

It will be seen that the entire project depends upon the 800 miles of land on the first part of the route, which is fast being taken up by settlers, and will soon be so much so as to defeat the project forever; for I do not believe there can ever be any other means than the lands, and when they are gone all is gone—more than 1200 miles without timber, mostly very poor land, and can never settle without the road to give the only means of communication with civilization and markets. I will now give you the simple plan by which I propose to carry out this great work.

As I have said before, I do not ask Congress to grant to me even one acre of land until the road is completed in advance. I first build 10 miles of road at my own expense, which will cost \$20,000 per mile; one mile of the land 60 miles wide is 36,000 acres, allowing for waste land and expenses of sale, will, at \$1½ per acre, produce about \$40,000, equal to build 2 miles of road. When the 10 miles is completed to the satisfaction of a commissioner appointed by government, then and then only, I have 5 miles or one half of the lands with which to reimburse myself, the other half to be sold and the proceeds held in the treasury as a fund, and so on for the 800 miles. Afterwards, to the mountains and to the ocean, when the entire 60 miles do not furnish means to continue the road, then this fund is to be applied to that purpose. And, gentlemen, from your own experience, I think you must be per-

suaded that the facilities which the road must undoubtedly give to settlement, would furnish means quite as fast as it could be applied to the construction of the road. You will perceive the plan is founded entirely upon the wilderness lands, and can only be carried out by connecting the sale and settlement thereof with the building of the road which cannot fail of being of vast importance and benefit to the settlers. With this road commenced, how changed would be the condition of emigrants?—Now they land upon our shores, from their inexperience in a strange land their little means is soon wasted, and many become burdensome to our citizens. And those who go to the far west are obliged from necessity to select their home remote from any means of communicating with markets, without any reward for labor until the first crop is grown, and then the cost of transit takes all, nothing left for an exchange for other comforts and necessities of life, he is surrounded with an abundance of earthly products and still wants; he does not get a reward for his labor to aid in sustaining the other branches of industry.

But commence this road, and the emigrant would have a fixed point of destination. He would not be detained in our cities, but pass on through our river, canal, and the lakes to his new home. If he had 50, 100 or more dollars, he could give one half towards paying for his land; the other half would build his cabin and get in his first crop. Then his labor would be wanted on the road to pay the balance for his land. The next season his crops ripened, and wanted by those who come as he was the season before. And those who come without money, their labor on the road would purchase the land, and they too would soon become independent; and comfort and happiness would surround all. And that would be the moral influence? Necessity often, yes, almost always, tempts man to vice and crime; but place him where his labor receives its just and proper reward, and you raise him. I care not how low he may have been, you elevate him to what his Creator intended him—to a man—and he may rear an offspring, respectable, honorable, and filling the highest places in the land.

The questions have been asked by many:—“How is the road to be protected from the Indians through a wilderness of such vast extent? And how is it to be supplied with water and fuel? And what will support it and keep it up?”

To the first I answer, if the road is built, it can only be done by the sale of the land and settlement of the country on its line, which will be a sufficient protection, and through where the land is poor, the constant business and operations of the road would protect it. The Indian disappears with the game; and it cannot be supposed that game such as buffalo and elk, the dependence of the Indian, would remain long in the vicinity of a railroad constantly in use, as this must be, even for its construction.

Fuel and water. Of the former, coal, there is an abundance all to the Rocky

Mountains and the other side. It has been found on the Columbia river and Vancouver's island.

Water; to the Missouri we cross living streams each ten to twenty miles; from the Missouri to the Pass, we go parallel with, and if necessary, directly on the banks of rivers, from the Pass to the ocean, probably follow the courses of the streams.

(To be Continued.)

#### ITEMS.

**New Spark Arrester.**—We find in an exchange, a brief notice of an invention in this line, by a mechanic of this city—name not given. Its principal peculiarity consists in the arrangement of pipes which conduct the smoke through a horizontal chamber containing a quantity of water, into which all the sparks and cinders are deposited, inasmuch that a white cambric handkerchief was not soiled by being held over the top of the smoke pipe. The trial was made with both coal and pine wood fuel. We wish the inventor ample success, though he may be aware that the use of a water chamber for catching the sparks has been projected and rejected some years since.

**Application** is to be made to the next Legislature of Connecticut, by the Norwich and Worcester railroad company, for liberty to change the track between the upper and lower depots in Norwich, so that it may run in a north and west direction.

**Wealth of the River Amazon, South America.**—We some time since noticed the fact, that a celebrated English nautical and mining engineer had been exploring the country up the Amazon and made some valuable discoveries as to the existence of extensive deposits of the precious metals, auriferous sand in the streams, and many botanical specimens quite unknown in this country. A company was formed in the United States to endeavor to reap the advantages of these discoveries; and the French sent out an expedition two or three years since, which has, however, turned out unsuccessful, as another is now forming to go out in the Astrolabe corvette and Alecton steamer of eighty horse power. The Academy of Science, under the direction of M. Arago, have given all the necessary instruction to the officers; and these vessels will leave, early in the spring, for the Brazils. From the discoveries which have been made, it is presumed that a communication exists between the Amazon and the Pacific, or, at least, a very slight interruption. The result is looked forward to with great interest by scientific men, as there appears to be no doubt entertained of the existence of large quantities of mineral wealth. The Anglo-American company are already prosecuting their researches, and have several narrow boats, drawing but little water, some of which are worked by steam, far up the river. From these exertions it is not too much to expect that we shall soon be in possession of some most interesting information of the mineral and other natural resources, the inhabitants, zoology, botany, and so forth, of this interesting but little known portion of the globe.

**Railroad Travel.**—From present indications there will be during the present season a greater amount of travelling than ever before in this country. The railroads in every direction have in prospect a rich harvest, for it is upon the passenger travel that they reap the largest profits. It is greatly desired, in view of these facts, that every possible precaution may be taken to avoid accidents and loss of life. With wholesome rules, rigidly enforced, we are sure many of the accidents that happen, might be avoided. A statement now before us says, nearly 800,000 passengers have been carried over the Albany and Troy road since its commencement, without the slightest injury or the loss of a single drop of blood to any of the passengers. This is highly creditable, and though we do not believe that the number of accidents by railroad travelling, compared with the greater number of the passengers passing over them, approaches the number of casualties by stage coaches, we still think that, by more efficiently enforced regulations, many of the accidents that now occur might be avoided, to the safety of life and to the profit of companies, resulting from the lessened destruction of railroad property, and the increased travel which the assurance of safety would invite. The fewer accidents and more profitable management by our more systematic neighbors in the eastern States, are proof of this. Notwithstanding the greater amount of travel there, accidents seldom occur, and as regards the profits of their railroads, the fact that there is not now a railroad running from Boston, the stock of which is not above par, is conclusive. What is true of railroads at the east, a very short season of experience will show to be true throughout the union. Railroads cannot fail to become immensely profitable.—*Ledger.*

**Auburn and Rochester Railroad.**—This road having been made the special object of attack by the Buffalo Express, it has been promptly vindicated by the Rochester papers. The Express had charged that it was the worst managed road on the line, and the mail failures, west, were mainly attributable to it. The Rochester Democrat furnishes a table of the time of departure and arrival of trains between Auburn and that place, for nine days, from which it appears that the train has started from Auburn but once at the regular hour, and then it arrived at Rochester in time. Twice it has left fifteen minutes behind, but arrived in time. In all the other cases it has been obliged to wait from one to four hours for the arrival of the eastern trains. The average time is 5 hours and 31 minutes, notwithstanding it has been obliged to lose time at meeting places, being, in consequence of the delay, an irregular train. The trains from Rochester to this place run with such precision, that some of our citizens set their clocks by it, and so far from being a badly managed road, we doubt if there is a better in the country. The agents and engineers are not only men of much experience and understand their business perfectly, but are also gentlemanly and accommodating to a degree that attracts general attention.—*Can. Rep.*

**Ogdensburg Railroad.**—A writer in the Boston Courier shows the advantages to that city of the Ogdensburg railroad in a strong light. He says that if the road had been opened this spring, Boston would have been a gainer by half a million of dollars, because she could have sold that amount of goods for the west, which would have reached their destination a month sooner than by the Erie canal. This is true so far as this year is concerned, but there is not usually so great a difference in the opening of the lake and canal.

**Appointment of Civil Engineer.**—We are pleased to learn that James Herron, Esq., of this city, distinguished for his knowledge of mechanics and scientific acquirements, has been appointed Chief Engineer at the United States Navy Yard at Pensacola, to superintend the public works which Congress has authorized to be constructed at that place, and the plans of which devised by Mr. Herron, have already been adopted.

Mr. Herron will, we doubt not, do justice to the appointment, and render good service to the government.

### BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

### MISSING NUMBERS

#### OF THE RAILROAD JOURNAL.

Subscribers, who wish to obtain Missing Numbers of Back Volumes of this Journal, will do well to apply immediately.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

**PIG AND BLOOM IRON.**—THE SUBSCRIBERS are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by

A. WRIGHT & NEPHEW,  
Vine St. Wharf, Philadelphia.

**CHAMPLAIN & CONNECTICUT RIVER RAILROAD.**—Notice to Contractors.—Proposals will be received until the 1st day of June, 1847, for the Grading, Mowing and Bridging of that part of the Champlain and Connecticut River Railroad, extending from the west side of the summit at Mt. Holly to the Village of Brandon, a distance of about 24 miles, and being the whole uncontracted portion of said road.

Maps, Profiles and Specifications may be found after the 20th of May next at the Office of the Engineer in Rutland, where every necessary information will be given.

The line will be divided in sections of convenient length for construction, and from those to whom the work may be awarded, satisfactory security will be required.

Proposals may be left with the undersigned, at Burlington—with George T. Hodges, Esq., at Rutland—or with William Henry, Esq., at Bellows Falls.

The work will be awarded at Rutland, as soon after the 1st of June, as the necessary examination of the bids can be made. By order of the Board,  
T. FOLLETT, President.

Office of the C. & C. R. R. Co.,  
Burlington, Vt., April 29, 1847.

**RAILROAD IRON.**—THE "MONTGOMERY" Iron Company, Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to  
MURDOCK, LEAVITT & CO.,  
Agents.

1748 77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC CEMENT.** This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floods, and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper barrels, by JOHN W. LAWRENCE,  
142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 33 1/2

**A. & G. MALSTON & CO., NO. 4**  
South Front St., Philadelphia, Pa.

Have now on hand, for sale, Railroad Iron, viz: 180 tons 2 1/2 x 1/2 inch Flat Punched Rails, 20 ft. long. 25 " 2 1/2 x 1/2 " Flange Iron Rails. 75 " 1 x 1/2 " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures. 11f

### LOCOMOTIVE AND CAR AXLES.

The Subscribers are now prepared to receive orders for the well known and approved Reading Locomotive and Car Axles—drawn to any required pattern from Bloom Iron only. Address

SAM'L KIMBER & CO.,

Willow Street Wharf,  
Philadelphia, Pa.

**RAILROAD IRON.**—THE NEW JERSEY Iron Company, Boonton, N. J., are now preparing to make Railroad Bars, and are ready to take orders or make contracts for Rails, deliverable after the first of December next. Apply to

FULLER & BROWN, Agent,

No. 139 Greenwich, corner of Cedar street.

September 18, 1846. 1029

**RAILWAY IRON.**—DAVIS, BROOKS & Co., No. 69 Broad Street, have now in port on Ship-board, 200 Tons of the best English heavy H Rails, 60 lbs. to the lineal yard, which they offer for sale on favorable terms, also, about 6 to 700 Tons now on the way, to arrive shortly, of the same description of Rail. 402

### TO CONTRACTORS.—KENNEBEC AND PORTLAND RAILROAD.

Proposals will be received at this office until the 15th of May, for the Grading and Mowing of 28 miles of this road, extending from North Yarmouth to Bowdoinham, and the Branch Road from Brunswick to Bath, including the masonry for the Bridges across the Androscoggin, New Meadows and Cathance rivers. The line of road and the plans and profiles will be ready for examination on the 10th of May; after which time any information in relation to the work can be had at this office, or of the Resident Engineers on the line of the road.

Persons unknown to the officers of the company, must accompany their bids with satisfactory evidence of their ability to execute the work.

The remainder of the line from Bowdoinham to Augusta, 21 miles, will be ready for contract about the 15th of June; of which due notice will be given.

GEO. S. GREENE, Eng. K. & P. R. R.

Engineers Office, K. & P. R. R.)

Brunswick, Me., April 6, 1847. 1m16

**THE SUBSCRIBER IS PREPARED TO** execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip.

New York.

# RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER

her having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d Avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

## ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—

For sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tinner ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,

75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.		Weight per fathom.	Diameter of iron.	
	INCH.	LB. OZ.	INCH.	LB. OZ.		LB.	INCH.	Tons.
11	4 1/2	13 5	10	21 -		50	1 5/16	20
13	3 1/2	8 3	8 1/2	16 -		27	1 1/16	13 1/2
14	3 1/4	6 11	7 1/2	12 8		17	9/16	10 1/2
15	2 3/4	5 2	6 1/4	9 4		13 1/2	1/2	7 1/2
16	2 1/2	4 3	6	8 8		10 1/2	7/16	7

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 360 lbs., and so on in proportion. 1724

## THE SUBSCRIBERS, AGENTS FOR

the sale of  
Codorus,  
Glendon,  
Spring Mill and  
Valley,  
} Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

SAM'L KIMBER & CO.,  
50 North Wharves,  
Philadelphia, Pa.

Jan. 14, 1846. [174]

## RAILWAY IRON.—THE BEST QUALITY

of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by

DAVIS, BROOKS & CO.,  
68 Broad St., New York.

Jan. 2. [117]

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

(Signed,)

WILLIAM ROE, Supt of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

(Signed,)

G. A. NICOLL,

Supt. Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

(Signed,)

T. L. SWINN,

Jersey City, November 4, 1845. N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

(Signed,)

JOHN LEACH,

Jamaica November 12, 1845. } 1719 Supt. Motive Power.

## NICOLL'S PATENT SAFETY SWITCH

for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without coming or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Castleboro, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee

G. A. NICOLL,

Reading, Pa.

## TO RAILROAD COMPANIES AND MANUFACTURERS OF RAILROAD MACHINERY.

The subscribers have for sale Am. and English bar iron, of all sizes; English Mower, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tires for locomotive engines, and other railroad carriage wheels, made from common and double refined E. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

THOMAS & EDMUND GEORGE,

N. E. cor. 12th and Market sts. Philad. Pa.

## RAILROAD IRON.—THE SUBSCRIBER'S

New Rail Iron Mill at Phoenixville, Pa., is expected to be ready to go into operation by the 1st of September, and will be capable of turning out 20 to 40 tons or finished Rails per day. They are now prepared to receive orders to that extent, deliverable after the 1st of October next, for heavy rails of any pattern now in use, equal in quality and finish to best imported.

PIG IRON.—They are also receiving weekly 150 to 200 tons of No. 1 Phoenix Foundry Iron, well adapted for light castings.

REEVES, BUCK & CO.,

45 North Water St., Philadelphia, or by their Agent, ROBT. NICHOLS, 79 Water St., New York,

## RAILROAD SCALES.—THE ATTENTION

of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 30 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearings and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLICOTT & ABBOTT.

Factory, 9th street, near Cones, cor. Melon st. Office, No. 3 North 5th street, Philadelphia, Pa.

**Railroad Travel.**—From present indications there will be during the present season a greater amount of travelling than ever before in this country. The railroads in every direction have in prospect a rich harvest, for it is upon the passenger travel that they reap the largest profits. It is greatly desired, in view of these facts, that every possible precaution may be taken to avoid accidents and loss of life. With wholesome rules, rigidly enforced, we are sure many of the accidents that happen, might be avoided. A statement now before us says, nearly 800,000 passengers have been carried over the Albany and Troy road since its commencement, without the slightest injury or the loss of a single drop of blood to any of the passengers. This is highly creditable, and though we do not believe that the number of accidents by railroad travelling, compared with the greater number of the passengers passing over them, approaches the number of casualties by stage coaches, we still think that, by more efficiently enforced regulations, many of the accidents that now occur might be avoided, to the safety of life and to the profit of companies, resulting from the lessened destruction of railroad property, and the increased travel which the assurance of safety would invite. The fewer accidents and more profitable management by our more systematic neighbors in the eastern States, are proof of this. Notwithstanding the greater amount of travel there, accidents seldom occur, and as regards the profits of their railroads, the fact that there is not now a railroad running from Boston, the stock of which is not above par, is conclusive. What is true of railroads at the east, a very short season of experience will show to be true throughout the union. Railroads cannot fail to become immensely profitable.—*Ledger.*

**Auburn and Rochester Railroad.**—This road having been made the special object of attack by the Buffalo Express, it has been promptly vindicated by the Rochester papers. The Express had charged that it was the worst managed road on the line, and the mail failures, west, were mainly attributable to it. The Rochester Democrat furnishes a table of the time of departure and arrival of trains between Auburn and that place, for nine days, from which it appears that the train has started from Auburn but once at the regular hour, and then it arrived at Rochester in time. Twice it has left fifteen minutes behind, but arrived in time. In all the other cases it has been obliged to wait from one to four hours for the arrival of the eastern trains. The average time is 5 hours and 31 minutes, notwithstanding it has been obliged to lose time at meeting places, being, in consequence of the delay, an irregular train. The trains from Rochester to this place run with such precision, that some of our citizens set their clocks by it, and so far from being a badly managed road, we doubt if there is a better in the country. The agents and engineers are not only men of much experience and understand their business perfectly, but are also gentlemanly and accommodating to a degree that attracts general attention.—*Canan. Rep.*

**Ogdensburg Railroad.**—A writer in the Boston Courier shows the advantages to that city of the Ogdensburg railroad in a strong light. He says that if the road had been opened this spring, Boston would have been a gainer by half a million of dollars, because she could have sold that amount of goods for the west, which would have reached their destination a month sooner than by the Erie canal. This is true so far as this year is concerned, but there is not usually so great a difference in the opening of the lake and canal.

**Appointment of Civil Engineer.**—We are pleased to learn that James Herron, Esq., of this city, distinguished for his knowledge of mechanics and scientific acquirements, has been appointed Chief Engineer at the United States Navy Yard at Pensacola, to superintend the public works which Congress has authorized to be constructed at that place, and the plans of which devised by Mr. Herron, have already been adopted.

Mr. Herron will, we doubt not, do justice to the appointment, and render good service to the government.

### BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

### MISSING NUMBERS

#### OF THE RAILROAD JOURNAL.

Subscribers, who wish to obtain Missing Numbers of Back Volumes of this Journal, will do well to apply immediately.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

**PIG AND BLOOM IRON.**—THE SUBSCRIBERS are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by  
A. WRIGHT & NEPHEW,  
Vine St. Wharf, Philadelphia.

**CHAMPLAIN & CONNECTICUT RIVER RAILROAD.**—Notice to Contractors.—Proposals will be received until the 1st day of June, 1847, for the Grading, Masonry and Bridging of that part of the Champlain and Connecticut River Railroad, extending from the west side of the summit at Mt. Holly to the Village of Brandon, a distance of about 34 miles, and being the whole uncontracted portion of said road.

Maps, Profiles and Specifications may be found after the 20th of May next at the Office of the Engineer in Rutland, where every necessary information will be given.

The line will be divided in sections of convenient length for construction, and from those to whom the work may be awarded, satisfactory security will be required.

Proposals may be left with the undersigned, at Burlington—with George T. Hodges, Esq., at Rutland—or with William Henry, Esq., at Bellows Falls.

The work will be awarded at Rutland, as soon after the 1st of June, as the necessary examination of the bids can be made. By order of the Board,  
T. FOLLETT, President.

Office of the C. & C. R. R. Co., }  
Burlington, Vt., April 29, 1847. }

**RAILROAD IRON.**—THE "MONTOUR Iron Company," Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to  
MURDOCK, LEAVITT & CO.,  
Agents.

1y48

77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC Cement.** This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight papered barrels, by JOHN W. LAWRENCE,  
142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 39 1y

**A. & G. HALSTON & CO., NO. 4**  
South Front St., Philadelphia, Pa.

Have now on hand, for sale, Railroad Iron, viz: 180 tons 2½ x ½ inch Flat Punched Rails, 20 ft. long. 25 " 2½ x ½ " Flange Iron Rails. 75 " 1 x ½ " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures. 11f

### LOCOMOTIVE AND CAR AXLES.

The Subscribers are now prepared to receive orders for the well known and approved Reading Locomotive and Car Axles—drawn to any required pattern from Bloom Iron only. Address

SAML KIMBER &amp; CO.,

Willow Street Wharf,  
Philadelphia, Pa.

4tf

### RAILROAD IRON.—THE NEW JERSEY

Iron Company, Boonton, N. J., are now preparing to make Railroad Bars, and are ready to take orders or make contracts for Rails, deliverable after the first of December next. Apply to  
FULLER & BROWN, Agent,

No. 139 Greenwich, corner of Cedar street.

September 18, 1846.

1033

### RAILWAY IRON.—DAVIS, BROOKS

& Co., No. 68 Broad Street, have now in port on Ship-board, 200 Tons of the best English heavy H Rails, 60 lbs. to the lineal yard, which they offer for sale on favorable terms, also, about 6 to 700 Tons now on the way, to arrive shortly, of the same description of Rail. 46tf

### TO CONTRACTORS.—KENNEBEC AND PORTLAND RAILROAD.

Proposals will be received at this office until the 15th of May, for the Grading and Masonry of 28 miles of this road, extending from North Yarmouth to Bowdoinham, and the Branch Road from Brunswick to Bath, including the masonry for the Bridges across the Androscoggin, New Meadows and Cuthance rivers. The line of road and the plans and profiles will be ready for examination on the 10th of May; after which time any information in relation to the work can be had at this office, or of the Resident Engineers on the line of the road.

Persons unknown to the officers of the company, must accompany their bids with satisfactory evidence of their ability to execute the work.

The remainder of the line from Bowdoinham to Augusta, 31 miles, will be ready for contract about the 15th of June; of which due notice will be given.

GEO. S. GREENE, Eng. K. &amp; P. R. R.

### THE SUBSCRIBER IS PREPARED TO

execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip.

New York.

1y10

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

### ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.

For sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,  
75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.	Weight per fathom.	Diameter of iron.	Tons.	
	INCH.	LBS. OZ.	INCH.	LBS. OZ.	LBS.	INCH.		
11	4½	13 5	10	21 -	50	15-16	30	
13	3½	8 3	8½	16 -	27	11-16	13½	
14	3¼	6 11	7½	12 8	17	9-16	10½	
15	2¾	5 2	6½	9 4	13½	1-2	7½	
16	2½	4 3	6	8 8	10½	7-16	7	

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1y24

### THE SUBSCRIBERS, AGENTS FOR

the sale of  
Codorus,  
Glendon,  
Spring Mill and  
Valley, } Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

SAM'L KIMBER, & CO.,  
59 North Wharves,  
Jan. 14, 1846. [1y4] Philadelphia, Pa.

**RAILWAY IRON.—THE BEST QUALITY** of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by

DAVIS, BROOKS & CO.,  
Jan. 2. [1y4] 68 Broad St., New York.

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLICOTT & ABBOTT.  
Factory, 9th street, near Coates, cor. Melon st.  
Office, No. 3 North 5th street,  
Philadelphia, Pa. 1y35

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 30 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,]

WILLIAM ROX, Sup't of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed,] G. A. NICOLL,

Sup't Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,]

T. L. SMITH,

Jersey City, November 4, 1845.

N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed,]

JOHN LEACH,

Jamaica November 12, 1845.

1y19 Sup't Motive Power.

### NICOLL'S PATENT SAFETY SWITCH

for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee  
G. A. NICOLLS,  
Reading, Pa.

ja45

### TO RAILROAD COMPANIES AND MANUFACTURERS

of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

THOMAS & EDMUND GEORGE,  
a45 N. E. cor. 12th and Market sts., Philad., Pa.

### RAILROAD IRON.—THE SUBSCRIBER'S

New Rail Iron Mill at Phoenixville, Pa., is expected to be ready to go into operation by the 1st of September, and will be capable of turning out 30 to 40 tons or finished Rails per day. They are now prepared to receive orders to that extent, deliverable after the 1st of October next, for heavy rails of any pattern now in use, equal in quality and finish to best imported.

PIG IRON.—They are also receiving weekly 150 to 200 tons of No. 1 Phoenix Foundry Iron, well adapted for light castings.

REEVES, BUCK & CO.,  
45 North Water St., Philadelphia,  
or by their Agent, ROBT. NICHOLS,  
284 79 Water St., New York.

## DAVENPORT & BRIDGES'

### CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

### THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trallis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trallis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trallis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.	
4,224 Timbers, 11 ft. long, 3 x 6 inches =	
68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	
4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs. at 4½ cts. =	101 25
Workmanship free of patent charge =	600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.

Civil Engineer and Patentee.

No. 277 South Tenth St., Philadelphia. 331

### FRANKLIN HOUSE,

No. 105 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,  
D. K. MINOR.

CHAS. MINOT, Sup't.

## SUMMER ARRANGEMENT.—NEW YORK AND ERIE RAILROAD LINE, from April

1st until further notice, will run daily (Sundays excepted) between the city of New York and Middletown, Goshen, and intermediate places, as follows:

### FOR PASSENGERS—

Leave New York at 7 A.M. and 4 P.M.

" Middletown at 6½ A.M. and 5½ P.M.

FARE REDUCED TO \$1.25 to Middletown—way in proportion. Breakfast, supper and berths can be had on the steamboat.

### FOR FREIGHT—

Leave New York at 5 P.M.

" Middletown at 12 M.

The names of the consignee and of the station where to be left, must be distinctly marked upon each article shipped. Freight not received after 5 P.M. in New York.

Apply to J. F. Clarkson, agent, at office corner of Duane and West sts. H. C. SEYMOUR, Sup't. March 25th, 1846.

Stages run daily from Middletown, on the arrival of the afternoon train, to Milford, Carbondale, Honesdale, Montrose, Towanda, Owego, and West; also to Monticello, Windsor, Binghamton, Ithaca, etc., etc. Agent on board. 131y

## NORWICH AND WORCESTER RAILROAD.

Summer Arrangement. Change of

Hours. Commencing on

Wednesday, April 21, 1847.

Accommodation Trains, daily, (except Sunday.)

Leave Norwich, at 6 a.m., and 4½ p.m. Leave

Worcester, at 8½ a.m., and 4½ p.m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston, and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 2½ p.m. train from Boston.

New York Train via Steamboat—Leave Norwich for Boston, every morning, except Monday, on the arrival of the stamboat from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 6½ p.m., daily, except Sunday, stopping at Danielsonville and Norwich.

Freight Trains daily each way, except Sunday.—Leave Norwich at 7, and Worcester at 6 30 a.m. Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are Less when paid for Tickets than when paid in the Cars. 321y

**LITTLE MIAMI RAILROAD.—OPEN TO SPRINGFIELD—Distance 84 miles—**

connecting at Xenia and Springfield with Messrs. Neil, Moore, & Co's. daily daylight lines of stages going east and north, to Columbus, Zanesville, Wheeling, Cleveland, and Sandusky City, via Urbana, Bellefontaine, Kenton, and the Mad river and lake Erie railroad, or Columbus, Delaware, and the Mansfield and Sandusky City railroad—forming, by these connections, the cheapest and most expeditious route to Buffalo, Niagara Falls, Rochester, Albany, New York, and Boston.

On and after Thursday, August 13, 1846, until further notice, a Passenger train will run as follows: Leave Cincinnati daily at 9 A. M., for Milford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Old Town, Yellow Springs, and Springfield.

Returning, will leave Springfield at 4 hours 35 minutes A. M. A line of Hacks runs in connection with the Cars, between Deerfield and Lebanon.

FARE—From Cincinnati to Lebanon...	\$1 00
" " " Xenia.....	1 50
" " " Springfield..	2 00
" " " Columbus...	4 00
" " " Sandusky city	8 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company, on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at of a passage for every \$500 in value over that amount.

The 1½ P. M. train from Cincinnati, and the 2 40 P. M. train from Xenia, will be discontinued on and after Monday, the 10th instant.

A freight train will run daily.  
47tf W. H. CLEMENT, Sup't.

**BALTIMORE AND OHIO RAILROAD. MAIN STEM. The Train carrying the**

Great Western Mail leaves Baltimore every morning at 7½ and

Cumberland at 8 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburgh and Hancock, connecting daily each way with—the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Pittsburgh. Time of arrival at both Cumberland and Baltimore 5½ P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pittsburgh \$10, and time about 32 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$12. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

**WASHINGTON BRANCH.**

Daily trains at 9 A. M. and 5 P. M. and 12 at night from Baltimore and at 6 A. M. and 5½ P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. s13y1

**MANUFACTURE OF PATENT WIRE**

Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tilters etc., by JOHN A. ROEBLING, Civil Engineer, Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition. 2v191y

**NEW YORK & HARLEM RAILROAD CO.—Winter Arrangement.**

On and after Monday, November 23,

1846, the cars will run as follows:

Leave 27th street for 42d street, Deaf and Dumb Institute, Yorkville, Harlem Morrianna, and Williams' Bridge, at 7 o'clock a.m. From City Hall for above named places, 2 p.m. [freight train,] 2 30 p.m. 5 p.m. to Morrisania only.

Leave City Hall for Harlem, Morrisania, Fordham and Williams' Bridge, at 7 45 a.m., and 10 45 a.m.; 1 15 p.m., 2 p.m. [freight train,] 2 30 p.m. and 3 45 p.m.

Leave City Hall for Hunt's Bridge, Bronx, Tuckahoe, Hart's Corners White Plains, Davis' Brook, Unionville and Pleasantville, [Pleasantville 4 miles from Sing Sing,] 7 45 and 10 45 a.m.; 1 15 p.m., 2 p.m. [freight train,] and 3 45 p.m.

**RETURNING.**

Leave Pleasantville, at 8, 10, [freight train,] and

11, a.m.; 1 30, and 4, p.m.

Leave White Plains, at 8 12, 10 30, [freight train]

and 11 20 a.m.; 1 50, and 4 20, p.m.

Leave Tuckahoe, 8 35, 10 55, [freight train,] and

11 35, a.m.; 2 05, and 4 35, p.m.

Leave Williams' Bridge at 7 45, 8 50 and 11 50 a.

m.; 2 40, 4, and 4 50 p.m.

Leave Morrisania 8 and 9 05 a.m.; 12 05, 2 35,

4 20, 5 05 and 6 p.m.

Leave Yorkville, at 8 12 a.m.; 4 35 and 6 15 p.m.

**SUNDAY ARRANGEMENTS.**

Leave City Hall for Pleasantville and intermedi-

ate places, at 7 45 a.m.; 1 15 and 3 p.m.

Leave Pleasantville for City Hall, at 8 a.m.; 11,

and 3 15 p.m.

Leave City Hall for Williams' Bridge and intermedi-

ate places, 10 45 a.m.; 2 30 p.m.

Leave Williams' Bridge for City Hall, at 8 50

and 11 50 a.m.; 1, 3 45 and 4 05 p.m. 1y49

**PHILADELPHIA, WILMINGTON & BALTIMORE RAILROAD.—1847.****Summer Arrangement.**

Philadelphia for Baltimore, 8 a.m. and 10 p.m.

Baltimore for Philadelphia, 9 a.m. and 8 p.m.

Connecting with Mail Lines North, South & West.

On Sundays, only the 10 P. M. Lines run.

The Boat Lines, via Newcastle & Frenchtown R.R.

Leave Philadelphia at 3½ p.m. } No line on Sun-

Leave Baltimore at 3 p.m. } day.

Accommodation Trains between Philadelphia &

Wilmington.—Philadelphia to Wilmington, 8 a.m.,

mail, 12½ p.m., 4 p.m., 7 p.m., 10 p.m. mail. Wil-

mington to Philadelphia, 7 a.m., 1 p.m., mail, 4½ p.

m.; 7 p.m., 12½ a.m., night mail.

J. R. TRIMBLE,

2f Engineer and General Superintendent.

**GEORGIA RAILROAD. FROM AUGUSTA to ATLANTA—171 MILES.**

AND WESTERN AND ATLANTIC RAILROAD FROM AT-

LANTA to OOTHICALOGA, 80 MILES.

This Road in connection with

the South Carolina Railroad and

Western and Atlantic Railroad now forms a con-

tinuous line, 368 miles in length, from Charleston

to Oothicaloga on the Oostenaula River, in Cass Co.,

Georgia.

**RATES OF FREIGHT.**

		Between Augusta and Oothicaloga and Dalton, 250 miles.	Between Charleston, Oothicaloga and Dalton, 355 miles.
1st class.	Boxes of Hats, Bonnets, and Furniture, per cubic foot.....	\$0 16	\$0 26
2d class.	Boxes and Bales of Dry Goods, Sadlery, Glass, Paints, Drugs and Confectionary, per 100 lbs.	1 00	1 50

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention. **ANDREW C. GRAY**, a45 President of the Newcastle Manuf. Co.

**R**AILROAD IRON AND LOCOMOTIVE Tyres imported to order and constantly on hand by **A. & G. RALSTON** Mar. 20th 4 South Front St., Philadelphia. 28th

**V**ALUABLE PROPERTY ON THE MILL Dam For Sale. A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 68,497 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x32 ft. with lathes, work benches, Work shop, 86x36 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, turnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45½ feet two stories high, with a shed part 45½x20 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 200 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to **HENRY ANDREWS**, 48 State st., or to **CURTIS, LEAVENS & CO.**, 106 State st., Boston, or to **A. & G. RALSTON & Co.**, Philadelphia. ja45

**T**O RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.

**PASCAL IRON WORKS.**

**WELDED WROUGHT IRON TUBES**

From 4 inches to 1 in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T, L, and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by **MORRIS, TASKER & MORRIS.** Warehouse S. E. Corner of Third & Walnut Streets, PHILADELPHIA.

**T**O LOCOMOTIVE AND MARINE ENGINE Boiler Builders. Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

**MORRIS TASKER & MORRIS,** Warehouse S. E. corner 3d and Walnut Sts., Philadelphia. 11f

**P**ATENT INDESTRUCTIBLE WATER

Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York.

**J. BALL & CO.**

**Birkenhead—Its Rise and Progress.**

We find in the Railway Record, of 10th April, the following account of the new city of Birkenhead—opposite Liverpool, on the Mersey. From this account, we predict that it will become a powerful rival to its prosperous neighbor.

"Birkenhead is certainly one of the great phenomena of the age; and, in its rapid growth and leading physiology, strikingly exhibits the character of that influence which commerce is beginning more and more potently to exercise in the social and political affairs of nations. Formerly, kings and courts were the principal founders of cities; and to their pleasures and expenditures the inhabitants looked for support. We have changed all that. Other kinds of considerations altogether determine the sites of towns. The interests of commerce are become more powerful than the interests of courts. New elements entered into our social system with the introduction of steam as a motive power, and revolutionized all the old modes of national development. Other authorities prescribe the grooves in which human events shall move, than political legislators. Governments could not have made a Birkenhead without enormous cost and loss. Of commerce, it has sprung up with a good percentage of profit in its hands. Here is a large, a beautiful, and wealth town, rising as it were spontaneously out of the earth, not at the arbitrary dictate of a powerful despot, but in the quiet way of national growth, and solely in obedience to the requirements of an ever-increasing commerce. Commerce has certainly become a most imposing power! A very few years ago—we remember it perfectly—a few houses fronting the river, looking very desolate in their solitude, and some poor fishermen's huts, constituted the whole of the town, now counting its inhabitants by tens of thousands, and boasting its splendid squares, streets, crescents, and parks: and, within these dozen years, we recollect the bounds of Sir William Stanley running down a fox, and hearing the huntsman's bugle in a wild spot where now stands a square of considerable architectural pretensions, larger than Belgrave square, in London, and every mansion in which has long been tenanted by the commercial and monied aristocracy of the place.

"Birkenhead has grown up chiefly under the direction of a few enterprising individuals. It has, consequently, had all the advantages of unity of effort and design, in its general arrangements, both of public and private buildings, and in carrying into effect the original plans with regard to all those sanitary regulations which the researches of the last few years have placed at the service of the large builder. The founders of Birkenhead determined to make it a model city. They have studied the requirements of populous towns, for the better preservation of the public health—and they have spared no cost to render their infant community as free from the ordinary elements of deterioration as possible. In this respect they have set a noble example to the rest of England. The streets are wide, airy and straight, cutting each other at right angles or running in parallels. This ar-

range gives them something of the prim monotony of the streets of Washington; but if it detract from the picturesque, it serves to promote a free circulation of air—the great desideratum of crowded cities. The houses are only permitted to be built on approved plans. Model cottages for the poor, furnishing many of the conveniences which the houses of the middle classes are without in the metropolis of the country, have been erected, and are let out at an incredibly low rate—and yet they are found to produce a good percentage on the outlay. The market is a fine building—one of the finest of the kind in the kingdom—airy, spacious, plentifully supplied with water, and cooled with refreshing fountains—in every respect utterly unlike the reeking nooks and dens which, to the disgrace of London, are permitted to engender all sorts of foul air and disease in the densest districts of the metropolis. The slaughter houses, those fatal hotbeds of fevers in London, are built at some distance from the town, and are so constructed as to prevent accumulation of decaying matters, and are provided with effective means for carrying them off. Besides these enlightened regulations, tending to procure a constant supply of fresh air, light and water, for the preservation of the public health, a wise forethought determined the projectors to set aside forever, for the benefit of the public, a large piece of ground as a park. This has been laid out with walks, trees, etc., at a cost of nearly £130,000. Yet this will soon be repaid in the advancing value of the surrounding properties, all of which will be let or sold for building purposes. Commercial transactions have taught the inhabitants of Birkenhead that the most liberal policy is ever in the end the most remunerative—a fact that cannot be too well and widely known.

"As a port, Birkenhead offers many advantages to the shipping of all nations.—When completed, the docks will be sufficiently capacious to float all the merchant navy of the world; while, from their form, and the railways being brought down to the edge of the water, they will afford facilities for loading and unloading goods, such as, perhaps, no other seaport in Europe can boast of.

Besides this, there are river advantages on the northern bank of the Mersey. Many eminent engineers have expressed the opinion that Liverpool was on the wrong side of the water. The authorities have likewise resolved to permit the use of lights and fires on board, as in the ports of London, Bristol, etc.—a boon of considerable importance to the crews, and especially to those of American vessels.

"One of the great advantages to commerce likely to arise from the rivalry of the two ports, will be a reduction of the dues now levied upon all goods and shipping in Liverpool. The town dues and the dues on goods, which in Liverpool amount to £200,000 per annum, will not be levied in Birkenhead;—and this amount will be saved to the owner, who will naturally enough use the new docks. In order to maintain her position, Liverpool

will be forced to reduce, if not altogether abolish, her most obnoxious imposts upon shipping, and to offer new inducements for the merchants of continental Europe and America to enter into still more intimate commercial relations with those great manufacturing districts of Lancashire and Yorkshire of which she is the natural outlet to foreign States. With one of the richest corporations in the world, she can well afford this reduction. But the men of Liverpool understand all this too well to need our pointing out."

**Printing Telegraph.**

We find the following article in the London Mining Journal of 10th April. Its statements would be highly interesting to the people of this country, if correct—but, like many other good things, they are too good to be true—during the present year. We have accomplished much in the erection of Telegraphs in this country, upon an improved and superior plan, invented by Professor Morse, for which he is entitled to rich rewards, both in a pecuniary point of view, and in the high regard of his countrymen; but we have not yet, that we are aware of, commenced the erection of a single line on the plan here designated the "Printing Telegraph"—though we have not a doubt but that improvements will be made upon the present plan, equal to those made and making upon the locomotive engine.

The plan of Telegraph of Mr. Morse, which alone is in use in this country, has no printing machine attached; but communicates by dots and lines—made upon paper passing under a point, acted upon by the electric fluid communicated at the other end of the wire—which, by various combinations, represent words, to be written out by the operator, or his assistant. We give this statement, as we find it, at length.

**"Brett's Electric Printing Telegraph.—"**

We had much pleasure in witnessing the operation of this highly useful and important invention, on Saturday last, at the offices in Parliament street. Hitherto the electric telegraph has been confined to the conveyance of verbal messages, which are read by peculiar signs on an indicating dial; and on that account its utility must, to a great extent, be limited. Mr. Brett, however, introduced to us, on Saturday last, an apparatus by which any two parties may themselves carry on a negotiation, or correspondence, and which will be unerringly printed at the rate of 87 letters per minute, without limit of distance either by sea or land. At one extremity of a line of telegraph is fixed a small box, containing a row of keys (similar to those of a pianoforte) and marked with the letters of the alphabet, which is connected by a single wire to a printing machine at the other extremity, containing a wheel, having on its circumference corresponding letters; a slight electric power is sufficient to regulate the motion of the whole, and the instant that a key representing any particular letter is touched at one end of the line, the corresponding letter of the type wheel prints—and the alarm bell rings—at the other. The communications are printed on a scroll of paper of unlimited length, from which any portion of the correspondence may be cut off at pleasure. The oceanic line, (of which Mr. J. Brett is the originator) is equally simple and practicable

—so that a communication made in London could be instantly printed in Dublin, Paris, Berlin, etc. Licenses have been already granted by the patentees to the enterprising house of Messrs. Livingston, Wells & Co., of New York, for the formation of lines of telegraphic communication in North America, to the extent of upwards of 4000 miles. These lines are in rapid progress towards completion, and partly in actual operation, realizing the most sanguine expectations of the patentees and the public. It is expected that in December next, they will be complete from Halifax, through Lower and Upper Canada, and across Niagara, will reach New York, and extend to Washington and New Orleans—so that the moment a vessel arrives at either port, the news it conveys can be printed simultaneously throughout that vast continent, at the rate of 87 letters per minute, without limit of distance. A line has been completed across the Allegheny mountains, and it has worked admirably between Philadelphia and Pittsburg—a distance 300 miles. The journals of Pittsburg have published the proceedings of Congress of one afternoon, on the following morning; and this is the case with all the news from the great cities of the Atlantic coast. The message of the Governor to the Legislature of New York, delivered at Albany on the 7th January, and consisting of two columns and a half of solid nonpareil, was published in New York two hours after its delivery, having been transmitted sentence by sentence by the electric telegraph. Mr. Brett had the honor of a visit from his Royal Highness the Comte de Montemolin, who appeared to take great interest in the invention, and expressed himself much pleased with it, and printed his own name by means of the telegraph. We have little doubt that it will supersede our present system, from its many superior advantages; and the government, in particular, ought not to lose sight of so important a power. The following may be stated as a few of the advantages of this patent: 1. The immediate communication of government orders and despatches to all parts of the empire, and the instant return of answers to the same, from the seats of local governments, etc., all delivered in an unerring and printed form. 2. A general telegraphic postoffice system, uniting the chief and branch offices in London, in connection with all the offices throughout the kingdom; for transmitting messages of business, etc., from merchants, brokers, tradesmen and private persons, at a fixed rate of charge; these communications would be printed on paper, and all enclosed in sealed envelopes, and addressed by confidential clerks, and issued by special messengers or the usual postoffice delivery. 3. The advantages of this plan, applied to police arrangements throughout the United Kingdom, and to the army and navy departments, must be at once obvious to the government. By it, instructions might be conveyed instantaneously, and the movements of the forces so regulated that any available number of them may be brought together at any given point, in the shortest possible time necessary for their

conveyance. These are some of the advantages, others readily suggest themselves, viz: general communication between stations on the coast, such as lighthouses, channels, islands, etc., so that a general supervision of the coast might be obtained for the use of the navy, Lloyd's, and for the prevention, of smuggling, etc. This invention, which, as our readers are aware, is of American origin, is held unitedly by Mr. Brett and Mr. R. E. Rouse, an American."

**"Submarine Electro Telegraph.**—An experiment, completely successful, was witnessed, on Saturday last, in the Isle of Wight, of the powers of Mr. Nott's electric telegraph. A perfect and rapid communication was established between East and West Cowes by means of a single wire sunk across the channel. The telegraphs were attached, one being placed at the Medina Hotel, and the other at the opposite side of the channel, near the Fountain Hotel. The signal bells were rung simultaneously, and the telegraphs commenced working and communicating questions and answers with the greatest precision and certainty, with a galvanic battery of low power, showing that a single isolated wire immersed in the water could carry the electric current a distance of half a mile. The water brought back the current to its source, without the slightest perceptible dispersion or loss of the dynamic power. This experiment demonstrates the perfect practicability of submarine communication, and the question as to its application may be said to be satisfactorily solved. The consequences can scarcely be as yet appreciated, though they are wonderful to contemplate. Instantaneous communication may be established between places divided by estuaries and channels, and islands and continents brought into immediate proximity of correspondence."

#### Locomotive Traction—Its Progress.

##### Galloway's Engine for Inclined Planes.

We published, in the last number of the Journal, a description of "Crampton's" improved locomotive, the "Namur," built for the Namur and Liege railroad, from the London Mining Journal, of April 10th, with an engraving. We now give a description of Galloway's locomotive for ascending inclined planes, from the Railway Record of the same date. The editor of the Record says: "We had an opportunity on Saturday last, and again on Thursday, of inspecting the engine constructed for ascending inclined planes, at present perfectly impracticable with the existing locomotives, in the most favorable weather. The engine has been working experimentally for some months past, on a severe incline laid down alongside the southern side of the Gt. Western line, near the Maidenhead station."

The invention is by Mr. Elijah Galloway, C. E., and consists in fitting to the locomotive a pair of horizontal (or nearly horizontal) driving wheels, and causing them to act on each side of an intermediate rail laid midway between the ordinary rails of each line. These driving wheels are pressed towards each other by means of springs, the pressure of which can be adjusted by screws. The nuts of the screws are toothed wheels, acted upon by a worm, the axis of which is carried up so as to be within the reach of the driver,

and the pressure can, therefore, be regulated to whatever the springs will bear, even when the train is in motion. The horizontal driving wheels are intended to be of the same diameter as the vertical driving wheels, and to act with them simultaneously, by means of connecting or coupling rods. It is proposed to lay the intermediate rails on the inclines only, so that on the levels the train will be propelled by the ordinary driving wheels; but, on coming to the foot of the incline, the additional wheels will run on to and embrace the middle rail, which is pointed so as to allow the wheels to snatch it with facility, and thus in addition to the bite of gravity, there may be obtained any requisite increased amount of bite. The great object of the invention, therefore, is obviously to avoid slipping, which is a most formidable drawback to locomotive traction, for the power of the locomotive depends solely upon the bite or adhesion between the driving wheels and the rails—and in wet weather, or when the rails are covered with snow or ice, this bite becomes so much reduced, that the only way of insuring the progress of the train is by employing additional engines, the locomotive failing, (as Mr. Robert Stevenson stated in his evidence before the Select Committee of the House of Commons, on Atmospheric Railways,) not for want of power, but for want of bite upon the rail.

The experimental engine employed on Thursday was an old engine belonging to the Great Western company, and made by Tayleure & Co. We believe it was the first engine employed on the line. It has been altered to Mr. Galloway's plan, by removing the ordinary driving wheels and substituting two horizontal wheels of three feet diameter, placed so as to nip a middle rail. The experiment, therefore is so far unfavorable to the invention, that the tractive force is obtained solely by the new driving wheels. With this drawback, however, the engine ascends a gradient of 1 in 19, with a gross load of about 32 tons. It also descends with ease and regularity, being controlled by a brake which acts upon the horizontal wheels; and as this breaking power is also dependent on the pressure on the middle rail, it is capable of being carried to a much greater extent than when the brake is applied to the tender—too much pressure on the brakes merely converting the tender into a sledge. The power, after its adaptation to Mr. Galloway's plan of this engine, is stated by Mr. D. Gooch (the company's locomotive engineer) in the following report:

*Gt. Western Railway Engineer's Office }  
Paddington, March 25, 1847. }*

"The following is the result of the experiment I made with Mr. Galloway's locomotive engine, in which the driving wheels are placed horizontally, and act against the sides of a central rail:

Weight of engine,	20 tons.
Weight of load	13½ "
	33½ "

"This weight was taken at a slow speed up an incline of 1 in 19, with a pressure on

the boiler of 60 pounds on the inch, and calculating the power of the engine and actual duty performed, we have as follows:

"With steam at 60 pounds in the boiler, the average effective pressure on the pistons, after deducting back pressure, will be about 50 pounds on the inch; then the area of the two cylinders  $308 \times 50 = 15,400$  pounds, and double stroke of piston equal 32 inches, and circumference of driving wheel, 116 inches.

"Therefore, as 116 inches : 15,400 :: 32 : 4,248 tractive power on the rim of the wheel.

"And gravity per ton 1 in 19 = 118 pounds.  
Friction, do., . . . . . 7

$124 \times 33.5$

tons = 4,187.5 pounds, resistance overcome.

"Therefore,  $4,248 - 4,117 = 61$  pounds, the total loss from the friction of the working parts of the engine which I think is as small a loss as can be hoped for in any class of engines. And from the facility of applying screws to increase the weight on the driving wheels to any required amount, there is no difficulty from slipping.

(Signed,) "DANIEL GOOCH."

We have stated that the novelty of this plan is the obtaining of an extra bite, when such is necessary, to prevent slipping. Archimedes said he could lift the world if he had but a fulcrum; and the difficulty of the locomotive engineer has been heretofore a similar one—the fulcrum has fluctuated with the weather, and in all cases it is limited to the adhesion due to the weight of the engine. An instance of the consequence of this state of things is furnished on the Lickey incline of the Birmingham and Gloucester railway, which is a gradient of 1 in 37 for upwards of three miles. To ascend this incline, an assistant engine is employed, weighing between (if we recollect rightly) 50 and 60 tons—the net load, in many cases, not exceeding 20 or 30 tons. The additional engine, therefore, at least doubles the gross load in such cases, and requires, of course, a corresponding increase of power to surmount the gradient. If the necessary bite can be ensured, engines of the ordinary power and weight would ascend this gradient without the aid of an assistant.

The principle admits of modifications according to the objects sought to be obtained, namely,

First. Increasing the power by increase of bite; and

Secondly. Increasing the power by reducing the size of the driving wheels.

The first of these conditions only would be requisite, where the engine can surmount the gradient of a line in dry weather, but fails when it is wet or greasy.

The second would give the power of ascending inclines where the present locomotive could not move under any circumstances whatever; because by reducing the diameter of the driving wheels, we convert speed into power.

The introduction of such a system, if it succeed to the extent anticipated, will most materially affect the cost of construction, especially through countries where good gradients can be obtained only by resorting to

heavy works, such as tunnels, cuttings, embankments, etc.; and when we consider that by works alone the cost of a railway may be made to vary from £8,000 to £50,000 per mile, the value of an invention which dispenses with those works will be readily appreciated. Nor does it follow that by concentrated gradients, such as would arise from taking more nearly the surface of the country, a great reduction of the mean speed would result, for the conversion of speed into power on ascending the steep inclines would be in some measure compensated for on the descent. It is stated that taking a gradient of 1 in 40 is a maximum. An engine having five feet driving wheels, and power equal to that of the Great Western engine, when secure from slipping, would draw a load of 100 tons at a speed of 30 miles at least per hour, up such a gradient.

#### The Iron Trade

In the London Mining Journal, of April 24th, we find the following article in relation to the iron trade.

"We have in this Journal steadily maintained that the importation of breadstuffs from America, coupled with the altered tariff on the importation of iron into America, would make the Americans customers to a greater extent than formerly for pig and manufactured iron; and the Glasgow market, since the arrival of the Hibernia, is represented to be at the beginning of a considerable advance, although at present, quotations cannot be given much higher.

"In the City article of the Times, the favorable accounts by the Hibernia are confirmed—but without giving credit to the extent of the orders for British manufactures, spoken of in some quarters, it is stated the accounts by this packet furnish signs of a decidedly 'good' trade.

"In our last number, it is recorded in the new Customs Bill, presented to the Chambers by the Minister of Finance, in France, there is a clause exempting sheet iron, iron in bars, copper and zinc, from the payment of all import duty, provided they be employed in the construction of vessels for the merchant navy, within one year after their importation, which is an additional reason for the better appearance of the pig iron market in Scotland.—These evidences of prosperity, in the present state of the money and corn market, argue favorably for an important advance in iron, when the present, to a certain degree, depressing influences are removed; and removed they assuredly will be, as the operation of the exchanges draws back a proportion of bullion left, and now leaving, the country; and the American orders, consequent on the profits of breadstuffs, increasing American expenditure, create a demand for articles of dress, and other British manufactures.

"With reference to railway undertakings, the 200,000 men employed still continue their work, and railway debentures advance in the estimation of the public. In connection with the present value of money, a morning contemporary observes, 'Were the investments in railways a mere speculative bubble, the measures now pursued by the bank would soon put them *hors de combat*—but experi-

ence has shown that the security is as good as the public funds; and as debentures, bearing 5 per cent. interest, are equivalent to a 3 per cent. of stock at 60, with the certainty of the return of the whole amount of the capital, no such disparity, as now exists between them, can be long maintained.' Looking to the future, when the minds of the commercial community can be settled with respect to the next harvest, and these prospects be favorable, there appears every reason to expect, not only an extensive business throughout the manufacturing districts, but a rapid advance in the completion of the railways, on which so large a number of laborers have now, for several months, been daily employed. The question arises, can the iron be supplied when required? and will not the competition, to have the necessary supplies, create an important advance—seeing, that without iron, no line can be put into working order? In conclusion, the 200,000 men employed are preparing roads to require, in one year, the entire make of iron in England, Wales and Scotland—and with this important fact before them, we again leave the iron trade to form their own conclusions."

#### Dublin and Kingston Railway.

We give the following extracts from the last annual report of this company, that our readers may be able to compare it with former reports published in this Journal in relation to the same work; and to show that low fares and frequent trains, especially in connection with large cities, produce good Dividends.

**Directors' Report to the Annual Meeting, April 15.**—The Extension Act, obtained in the last session of Parliament, has provided for half-yearly meetings and half-yearly statements of accounts; and at the first of those meetings under that Act, held on the 16th of October last, the Board presented a Report, with a short abstract of the accounts for the preceding six months, informing you at the same time that they would lay before you on this occasion a detailed statement of accounts and the usual statistical returns for the whole year, so as to enable you to compare them with the previous annual statements. Accordingly they now submit the following statistical returns, with which it has been the practice for several years past to commence their Reports:—

Number of passengers booked at all the stations,	1,668,650
Last year,	1,747,100
Decrease,	70,450
Estimated trips by subscribers,	635,260
Last year,	601,513
Increase,	33,747
Gross number of passengers, subscribers included,	2,903,910
Last year,	2,348,614
Decrease,	44,703
Subscriptions received,	£7,901 1 10
Last year,	7,598 12 10
Increase,	£298 9 0
Gross income from all sources (exclusive of Dalkey),	£51,691 15 9
Last year,	53,036 19 1
Decrease,	£1,345 3 11

You will participate in the regret of the Board that these statements do not exhibit the progressive increase which they have usually shown; but much as this is to be regretted, it cannot excite surprise. The awful calamity which has fallen on this country has not been confined in its effects to the mere immediate sufferers, and one consequence has been a very general anxiety to limit expenditure wherever practicable. This has not only caused a considerable diminution of traffic, but, combined with other circumstances, has tended to produce nearly a total cessation of building in all those districts which affect your income, with the single exception of the neighborhood of Dalkey. The Board, however, confidently hope that the present very general depression will have only a temporary effect, and that as all the elements of the prosperity of the company remain unchanged, there will be a corresponding reaction at no distant period.

The relaying of the road with heavier rails has been completed within the year, and all the old rails sold, leaving a balance of 1,977l. 8s. 2d. against that account, part of which 948l. 3s. has been charged against the unappropriated balance of the contingent fund, and the remainder, 1,029l. 5s. 2d., has been charged to profit and loss.

The appropriation of 2,000l. per annum for the purpose of liquidating the debenture loan having been discontinued by a special general meeting of the 29th of August, 1844, in pursuance of a recommendation from the Board, they have now directed that the sum to the credit of this account amounting to 4,000l., shall be transferred to that of profit and loss.

There appears to be a considerable increase upon this year's account in the expenditure of the locomotive and carriage department, but this is accounted for by the fact that the whole of the new work executed within the year—the outlay upon which has exceeded 4,000l.—has been charged in the

present accounts to annual expenditure, while in last year's account a large proportion of the cost of new engines and carriages was, with your sanction, charged to the contingent fund. A considerable addition has been made by this outlay to the value of your stock of engines and carriages.

On the Dalkey line the atmospheric apparatus has continued to work with great regularity during the past year, the attraction of novelty having, however, nearly ended, there has been some reduction of income from it, but the great impulse which has been given to building in the neighborhood of Dalkey, gives the Board reason to expect that there will be a corresponding increase in the receipts of both lines.

The balance of the profit and loss account applicable to dividend is 9,007l. 11s. 4d.; and the Board declare a dividend for the half-year of 4l. 10s. per share on the original shares of the company, amounting to 9,000l., which will be payable on and after Monday, the 26th inst.

*Revenue Account for Year ended Feb. 28.*

*Patent Office Report.*

The Report of the Commissioner of Patents, lately published, shows that during the year ending December 1, 1846, there were 1272 applications for patents. The number of patents issued during the same period was 619, including 13 re-issues, 5 additional improvements, and 59 designs. The number of patents expired, 473. Three applications for extensions have been made, two of which were rejected, and one is still pending. Two patents have been extended by Congress.

There have been received by the commissioner \$50,264 16, of which sum \$11,068 99 have been repaid on applications withdrawn, and for money paid in by mistake. The expenses of the office during the year were as follows: for salaries, \$10,142 97; temporary clerks, \$5,785 61; contingent expenses, \$7,485 19; compensation of district judge, \$100; library, \$675 96; agricultural statistics, \$2,610 68—making the total amount of expenses, \$33,700 41. There was also paid for the restoration of records and drawings, \$786 31, and for duplicate models, \$585—making the aggregate of expenditures, including the amount paid back on withdrawals, \$46,158 71; leaving a balance to be carried to the credit of the patent fund of \$4,105 45.

The amount of money in the treasury to the credit of the patent fund, on the 1st of January, 1845, was \$182,459 00. The balance paid in on the 1st of January, 1847, increases it to \$186,565 14.

The commissioner, in his report, speaks of the existing law by which a subject of Gr. Britain is compelled to pay into the treasury the sum of \$500 before his application can be examined, and the citizens and subjects of all foreign countries to pay \$300 on their respective applications. He says:

"These duties were designed to bear some proportion to the duties required of American citizens making applications for patents in other countries, and on that ground may, perhaps, be justified and defended.

"The effect of this provision is unquestionably to prevent the introduction into this country of many useful and valuable discoveries, which would otherwise be patented and introduced. Similar high duties have the effect to exclude American inventions from other countries. Thus all countries are injured by this system of taxing genius for the exertion of its powers, in order to obtain comparatively a very small and trifling amount of revenue.

"It affords no protection to the American inventor to keep out the discoveries of his foreign emulator (not rival) in the arts, by

taxing the emanations of his genius with high duties, while the country would derive much benefit from their introduction."

The details which follow the report, says the Washington Union, are full of new and interesting facts, and the whole volume embraces nearly four hundred pages.

Correspondents will oblige us by sending in their communications by Tuesday morning at latest.

#### AMERICAN RAILROAD JOURNAL.

Published by D. K. MINOR, 106 Chestnut St., Philadelphia.

Saturday, May 29, 1847.

#### Androscoggin and Kennebec Railroad.

It will be seen by the advertisement in the Journal that a portion of this road is now ready for the contractors, and that the remaining portions are to be in readiness in July and September next. This is truly going ahead—and we wish the enterprising and spirited friends of the work all the success in its early completion, that they can possibly desire.

#### Philadelphia and Trenton Railroad.

The Philadelphia and Trenton Railroad is completed nearly to Bridesburg, the track having been relaid with a very heavy rail, rolled at the Trenton Mills, of a pattern altogether new. When the road is completed, and the trains make their usual speed, this line will connect with the morning line for New York, by which means Philadelphia passengers will be able to get in New York at 9½ o'clock in the morning. This will make four regular daily lines between the cities.

#### The Railroads.

At the last accounts, stockholders of the Connells-ville Railroad Company, had held a meeting in Pittsburgh and exhibited a strong disposition against continuing the negotiations with the Baltimore and Ohio Railroad Company.

A letter was presented from John P. Kennedy, asking ten days delay before closing the negotiation. The following resolution was adopted:

"Resolved, That in compliance with the request of John P. Kennedy, Esq., a zealous friend of the Pittsburgh connection, the stockholders do now adjourn, to meet again at this place on the 29th inst."

There was a strong feeling evinced at the meeting in favor of co-operation with Philadelphia, in the construction of the road.

Meantime, the work of the Pennsylvania Railroad, to unite the two business capitals of this State, will be pushed forward with vigor, and the benefits will be early felt at both extremities, and along the line.

#### Lewiston and Waterville Railroad.

If any of our friends have ever doubted whether this enterprise would really be undertaken, we think their skepticism is likely to be soon dissipated. By

the notices of the Directors, it appears that the work is to be driven on this season with the utmost energy. They have just ordered an assessment of five per cent. to be paid by the 16th of June next, and have also ordered to be put under contract 15½ miles of the road, from the junction with the Atlantic and St. Lawrence Railroad to Greene Centre. They have resolved too, that the section from Greene Centre to the head of Snow's Pond shall be put under contract by the 15th of July, and the residue of the road to Waterville in September next.

#### The Boston Lines.

There will be no lack of conveyance between New York and Boston during the present season. There are the two night lines by the Norwich and Stonington routes, with two excellent boats each. The Long Island route, through by daylight: and another by way of New Haven and Springfield. There is also an evening line by the Hartford boat, and probably another by steamboat to Providence. Besides these, a new line is opened via Fall River, which will probably be one of the most popular, as well as pleasant routes; and if a traveller is not satisfied with any of these, he can take a night line to Albany, and proceed to Boston at about the same rate of fare, or take the route of Bridgeport and Housatonic to meet the Albany cars at West Stockbridge, and thence by the Western to Boston.

#### The Canals.

We learn that the communication between the Delaware Division of the Pennsylvania Canal, and the feeder of the Delaware and Raritan Canal, will be made during the present season. The Canal Company have commenced their portion of the work, and the Canal Commissioners of Pennsylvania have obtained the loan which they were authorized to make for the work on their side, and they will proceed to distribute the contracts as speedily as possible. The present plan is to deepen the channel across the Delaware, and thus avoid any interruption to the raftmen or other interests engaged on the river.

#### Rochester Four Trade-Tolls.

The following is a statement of the flour shipped east from Rochester on the Erie canal during the first week of canal navigation:

From opening of navigation to May 8th....42,031  
Do. to same date in 1846.....39,900

Increase in 1847.....2,131

It will be seen that the amount of flour shipped in 7 days this year exceeds the quantity shipped last year in 22 days.

The tolls received during the first week of navigation, are as follows:

1847.....\$16,678 50  
1846.....7,440 00

Increase in 1847.....\$9,264 50

#### Railway Traffic.

The editor of the Railway Chronicle—April 24—says: "From our official returns, it appears that the amount of traffic for the last week, on upwards of 2,730 miles of railway, was £159,019, thus accounted for:—£85,638, for the conveyance of passengers only, £39,010 for the carriage of goods, and a remainder of £34,371 for passengers and goods together, not respectively apportioned; being an increase of £24,496 over the corresponding week of last year, when the mileage was about 1,920."

May 1—"It appears that the amount of traffic for the last week, on upwards of 2,730 miles of railway was £161,735, thus accounted for:—£84,223 for the conveyance of passengers only, £42,060 for the car-

riage of goods, and a remainder of £35,432 for passengers and goods together, not respectively apportioned; being an increase of £22,748 over the corresponding week of last year, when the mileage was about 1,920.

#### Puddling Iron.

Some of our readers, says the Scientific American, may not know what is to be understood by the term "puddling iron"—It is simply putting pig or scraps of iron into a heated furnace, where it melts and boils, being constantly stirred until it becomes dry or hard enough to form a ball. It is then taken from the furnace, put under a heavy hammer, and made into blooms which are drawn between heavy rollers into rods or bars to suit customers.

#### Iron Trade in England.

There appears to be a slight depression in this branch of business. The enormous demand, however, for railway purposes, which is not likely, from present appearances, to diminish, will, we think, sustain the present prices, if not cause an advance.

IRON.—Welsh and Staffordshire have been quiet during the week; Scotch pigs have receded, and there are sellers at quotations; In Swedish and Russian nothing doing.

GLASGOW PIG IRON TRADE, April 28.—Pig iron participates in the present general depression of trade. In the absence of speculation in the article, and from the chariness of consumers about buying, prices are receding every week. Something like a panic seized the holders this week, and numerous parcels changed hands at from 68s. 6d. to as low as 67s. 6d. Now, at this low figure, there are no buyers, and a further decline is looked for.

#### The City of Reading.

The annexed remarks, from the United States Gazette, will be read with satisfaction. None can feel a deeper interest in the advancement of the city of Reading than ourselves, and we are happy to note the improvements alluded to below, in that rapidly thriving place. The Gazette says "the good people of Reading are rejoicing in the revival and re-establishment of the Branch of the Bank of Pennsylvania in their city. Yes, the city of Reading—henceforth no longer to be designated by the quaint, old-fashioned cognomen—Reading-town, celebrated only for its annual Fair, and the manufacture of felt hats. We say again, the city of Reading—and a city indeed it has become, not only by legislative fiat, actual incorporation, municipal regulation and appliances from Lord Mayor down, but worthy of the rank, by its population, extent, vast establishments, abounding wealth, and the evidences it every where furnishes of vigorous and successful enterprise. Why, this ancient Borough, surrounded by a population of some sixty thousand Germans, where it was as necessary a few years ago to speak Dutch to make yourself generally understood, as it is still

to speak French to get along comfortably in Montreal or Quebec, will soon present a fair chance to attain a respectable standing in society, and to transact ordinary business with the knowledge of English alone. Their Court House no longer occupies the centre of the street, between the market houses. A new structure has recently been erected for the Courts and public records, upon a liberal scale, in a commanding site, of beautiful proportions, with classic adornments, and magnificent steeple, surmounted by a statue of Justice, which should have been, but for which, if we mistake not, a figure of Liberty has been substituted for the sake of more symmetrical finish. Let the Architect, our own Walter, take the responsibility of this, and let no one say the people of Old Berks reverence the Liberty Cap more than the Scales and Sword of Justice.

And what is still more to their honor, a new county prison has recently been commenced, with Haviland for the Architect, with the liberal appropriation of fifty thousand dollars, and more, upon the plan of solitary confinement and labor, embracing all the new improvements in warming and ventilation, and for exercise and supervision."

#### Atlantic and Ohio Telegraph.

The neglect of the Patentees to ratify the compromise made by Mr. O'REILLY for the immediate construction of the Telegraph Line, from Pittsburgh to Cincinnati and Louisville, is calling forth much complaint at the West. One writer says, "The indignation of the Western people is now showing itself in good earnest. The abandonment of the compromise is loudly called for, and pushing ahead upon the original basis, which has thus far baffled all opposition and detraction."—The Cincinnati Daily Chronicle says:

"We see the Gazette, and occasionally other writers, ask what has become of the Magnetic Telegraph West? We are not one of the Stockholders, but we suspect we know what is the matter with it. The company formed here, had to rely upon the assent of Messrs. Kendall, Smith & Co. The latter were unwilling to give up a portion of their profits to the O'Reilly Company, who possessed the legal right to make the line West, under their contract. Kendall & Co. hold back, and no reliance can be placed upon them whatever. They have not yet given their assent to the contract.

"It was announced some time since, that the O'Reilly Company had commenced making their line West from Pittsburgh. We hope, that as the injunction was removed, they will continue, and finish the line to Cincinnati. There is one thing, the companies looking to profits from Magnetic Telegraphs, should remember, *Lightning* can't be patented, and *wires* can't be patented; for they are in universal use. Nothing is patented, then, but Mr. Morse's particular method of writing down the recruits. Change this method, by any new invention or different construction, and another Company may make another line. This is an important fact, in the idea of future profits from these Companies."

The Telegraph Line between Philadelphia and Pittsburgh is in most admirable working order and continues to give universal satisfaction. Much credit is due to the industry, ingenuity and gentlemanly bearing of the Superintendent, Jas. D. Rym, Esq., and the young gentleman operators on the line for the popular favor it has attained. We annex the following from the Daily Advertiser of this city:

"We learn from an authentic source that this model line fully sustains the high estimate of its capabilities, which was formed prior to its going into operation. No breaks occur daily to interrupt communication, but every thing goes on with the utmost regularity. The substantial manner in which the line was constructed, ensures a degree of permanency which is sadly wanted in most other lines.

"We understand that every thing is now in rea-

diness for the extension of the line from Pittsburgh west. Mr. O'Reilly will superintend the work in person—a fact which affords an ample guarantee that it will be done well and speedily. Mr. O'R., by his indefatigable exertions, and unquestioned integrity, has won the unlimited confidence of the business men and the press, in the section of country which he has traversed. That he will continue to enjoy it, we both hope and believe.

"We may add, for the information of stockholders in the Philadelphia and Pittsburgh line, that a dividend will be declared on the 1st July, and afterwards quarterly.

#### Railroads.

The Trenton (Tenn.) Emporium, in a lengthy and well-written article upon the subject of railroads—in connection with the great resources of the south and west—remarks that "the valley of the Mississippi is destined not only to sustain its own countless millions of future population, but to furnish large supplies of various kinds, to other less favored sections of our own country, and to become the granary and storehouse of a large portion of the civilized world. The millions of the products of this teeming region must find their way by various outlets to the Atlantic seaboard, or to the Gulf of Mexico, there to be consumed or to be shipped to foreign countries. The father of waters and its tributaries afford a natural, but a long, tedious and dangerous outlet, for the surplus products of the great valley, and the foresight and enterprize of our brethren of the Eastern States and cities have already opened various artificial channels, for diverting this immense trade, from its down stream tendency, more directly to their own ports and warehouses. First turnpike roads, rivers and canals were constructed or improved for this purpose; but, more recently, railroads, for travel and transportation, and telegraphic wires, for the transmission of intelligence, have given a new impetus to the traffic through these channels, and to the Herculean efforts now making for their multiplication and extension. Not less than six or seven great lines between the Atlantic ports and the great valley of the west have already been commenced, and are now in more or less rapid progress. Even in the extreme northeastern section of the Union—Portland is endeavoring through Canada, and by way of the Lakes, to reach this mine of inexhaustible wealth, and her works, in concert with those of Canada, are now being prosecuted with energy. Next comes Boston, with her immense capital, her noble enterprize and her far-reaching policy. Not content with one great line of communication with the great west, she avails herself of the improvements of all her neighbors, and is vigorously pressing forward in at least two directions, for the great prize, contending with New York in her own proper sphere, and passing the Niagara through Upper Canada, she will speedily penetrate the rich and populous regions beyond Lake Erie. Her superior forecast and energy draw all within her vortex.

The Empire city, after completing her great Erie canal, relying upon her superior natural advantages, rested from her labors for a time, until she found herself outstripped by her more enterprising neighbor. But now being awakened to the danger, is pushing forward the New York and Erie railroad, hoping to regain her supremacy.

Pennsylvania also is not idle, but in addition to her canal and railroad communication with Pittsburg, is now strenuously urging forward her Great Central railway, which it is in contemplation to extend speedily through the capitals of Ohio, Indiana and Illinois, to the Mississippi, at St. Louis or Alton.—This, when completed, will be the most important

of all the principal railways penetrating the great valley.

Next in order comes the Baltimore and Ohio railroad, one of the first and boldest enterprizes of the time. Through many difficulties, this undertaking of late has advanced under better auspices. It is, however, to be feared, that competition with rival lines may dim its prospects, and retard its progress.

The Old Dominion has at length opened her eyes to the importance of securing a participation in the traffic of the great western valley, and has recently granted a very favorable charter to the Richmond and Ohio road, which it is hoped will induce enterprising capitalists to embrace it with avidity.

Last, though not least in importance, and of the most immediate interest to the southern section of the Union, come the works of South Carolina and Georgia, which now united have nearly reached the southern boundary of Tennessee. An advantageous charter has been granted to the Nashville and Chattanooga railroad company, which promises speedily to commence operations; and this, with the Central railroad, now in contemplation, will complete the communication between the Mississippi river and the Atlantic, at Charleston and Savannah.

These railroads are the iron bands that will bind the various sections of our beloved country together by a community of interest and fraternal feeling, and it is hoped, will render our union indissoluble. The last named of these great public works being of paramount and vital importance to the State of Tennessee, particularly to our portion, it will receive further attention in future numbers."

#### Philadelphia, Wilmington, and Baltimore Railroad Company.

Our readers are aware that for several weeks past an effort has been made on the part of the stockholders and bondholders of this company, for the purpose of relieving it from a large portion of its heavy indebtedness, and improving the condition of the road.

We are happy to state, adds the Gazette, that on the 1st inst. this important and much desired arrangement was fully accomplished, and the debts of the corporation greatly reduced.

The only debt of the Company at this time, is the funded mortgage loan, payable in 1860, and amounting to \$2,161,776 05. The second mortgage loan of £192,500 sterling and the entire floating debt, have been extinguished by a conversion into the stock of the Company at par.

By this arrangement, the annual interest, payable by the Company, is reduced to the sum of seventy thousand dollars. Every note of the Corporation has been paid—and with the large and increasing business of the road, there is now a sure guarantee that its condition will be improved, and the speed of travel increased between the two cities.

The greater portion of the stock of this Company has recently been purchased by capitalists in New England, who have taken it under the conviction that a main line of Railroad, connecting two such cities as Philadelphia and Baltimore, must become productive of handsome profits, if properly improved and equipped, and judiciously managed.

As an earnest of their intention to place the work in an improved condition, we learn that the Iron is now on hand to relay ten miles of track, when the whole line will be continuous heavy edge rail.

This desirable arrangement, which required the unanimous consent of all parties in interest, has been a work of great labor, and we heartily congratulate all the parties and the public upon its successful consummation.

to speak French to get along comfortably in Montreal or Quebec, will soon present a fair chance to attain a respectable standing in society, and to transact ordinary business with the knowledge of English alone. Their Court House no longer occupies the centre of the street, between the market houses. A new structure has recently been erected for the Courts and public records, upon a liberal scale, in a commanding site, of beautiful proportions, with classic adornments, and magnificent steeple, surmounted by a statue of Justice, which should have been, but for which, if we mistake not, a figure of Liberty has been substituted for the sake of more symmetrical finish. Let the Architect, our own Walter, take the responsibility of this, and let no one say the people of Old Berks reverence the Liberty Cap more than the Scales and Sword of Justice.

And what is still more to their honor, a new county prison has recently been commenced, with Haviland for the Architect, with the liberal appropriation of fifty thousand dollars, and more, upon the plan of solitary confinement and labor, embracing all the new improvements in warming and ventilation, and for exercise and supervision."

#### Atlantic and Ohio Telegraph.

The neglect of the Patentees to ratify the compromise made by Mr. O'REILLY for the immediate construction of the Telegraph Line, from Pittsburgh to Cincinnati and Louisville, is calling forth much complaint at the West. One writer says, "The indignation of the Western people is now showing itself in good earnest. The abandonment of the compromise is loudly called for, and pushing ahead upon the original basis, which has thus far baffled all opposition and detraction."—The Cincinnati Daily Chronicle says:

"We see the Gazette, and occasionally other writers, ask what has become of the Magnetic Telegraph West? We are not one of the Stockholders, but we suspect we know what is the matter with it. The company formed here, had to rely upon the assent of Messrs. Kendall, Smith & Co. The latter were unwilling to give up a portion of their profits to the O'Reilly Company, who possessed the legal right to make the line West, under their contract. Kendall & Co. hold back, and no reliance can be placed upon them whatever. They have not yet given their assent to the contract.

"It was announced some time since, that the O'Reilly Company had commenced making their line West from Pittsburgh. We hope, that as the injunction was removed, they will continue, and finish the line to Cincinnati. There is one thing, the companies looking to profits from Magnetic Telegraphs, should remember, *Lightning* can't be patented, and *wires* can't be patented; for they are in universal use. Nothing is patented, then, but Mr. Morse's particular method of writing down the recruits. Change this method, by any new invention or different construction, and another Company may make another line. This is an important fact, in the idea of future profits from these Companies."

The Telegraph Line between Philadelphia and Pittsburgh is in most admirable working order and continues to give universal satisfaction. Much credit is due to the industry, ingenuity and gentlemanly bearing of the Superintendent, JAS. D. REED, Esq., and the young gentleman operators on the line for the popular favor it has attained. We annex the following from the Daily Advertiser of this city:

"We learn from an authentic source that this model line fully sustains the high estimate of its capabilities, which was formed prior to its going into operation. No breaks occur daily to interrupt communication, but every thing goes on with the utmost regularity. The substantial manner in which the line was constructed, ensures a degree of permanency which is sadly wanted in most other lines.

"We understand that every thing is now in read-

iness for the extension of the line from Pittsburgh west. Mr. O'Reilly will superintend the work in person—a fact which affords an ample guarantee that it will be done well and speedily. Mr. O'R., by his indefatigable exertions, and unquestioned integrity, has won the unlimited confidence of the business men and the press, in the section of country which he has traversed. That he will continue to enjoy it, we both hope and believe.

"We may add, for the information of stockholders in the Philadelphia and Pittsburgh line, that a dividend will be declared on the 1st July, and afterwards quarterly.

#### Railroads.

The Trenton (Tenn.) Emporium, in a lengthy and well-written article upon the subject of railroads—in connection with the great resources of the south and west—remarks that "the valley of the Mississippi is destined not only to sustain its own countless millions of future population, but to furnish large supplies of various kinds, to other less favored sections of our own country, and to become the granary and storehouse of a large portion of the civilized world. The millions of the products of this teeming region must find their way by various outlets to the Atlantic seaboard, or to the Gulf of Mexico, there to be consumed or to be shipped to foreign countries. The father of waters and its tributaries afford a natural, but a long, tedious and dangerous outlet, for the surplus products of the great valley, and the foresight and enterprize of our brethren of the Eastern States and cities have already opened various artificial channels, for diverting this immense trade, from its down stream tendency, more directly to their own ports and warehouses. First turnpike roads, rivers and canals were constructed or improved for this purpose; but, more recently, railroads, for travel and transportation, and telegraphic wires, for the transmission of intelligence, have given a new impetus to the traffic through these channels, and to the Herculean efforts now making for their multiplication and extension. Not less than six or seven great lines between the Atlantic ports and the great valley of the west have already been commenced, and are now in more or less rapid progress. Even in the extreme northeastern section of the Union—Portland is endeavoring through Canada, and by way of the Lakes, to reach this mine of inexhaustible wealth, and her works, in concert with those of Canada, are now being prosecuted with energy. Next comes Boston, with her immense capital, her noble enterprize and her far-reaching policy. Not content with one great line of communication with the great west, she avails herself of the improvements of all her neighbors, and is vigorously pressing forward in at least two directions, for the great prize, contending with New York in her own proper sphere, and passing the Niagara through Upper Canada, she will speedily penetrate the rich and populous regions beyond Lake Erie. Her superior forecast and energy draw all within her vortex.

The Empire city, after completing her great Erie canal, relying upon her superior natural advantages, rested from her labors for a time, until she found herself outstripped by her more enterprising neighbor. But now being awakened to the danger, is pushing forward the New York and Erie railroad, hoping to regain her supremacy.

Pennsylvania also is not idle, but in addition to her canal and railroad communication with Pittsburg, is now strenuously urging forward her Great Central railway, which it is in contemplation to extend speedily through the capitals of Ohio, Indiana and Illinois, to the Mississippi, at St. Louis or Alton.—This, when completed, will be the most important

of all the principal railways penetrating the great valley.

Next in order comes the Baltimore and Ohio railroad, one of the first and boldest enterprizes of the time. Through many difficulties, this undertaking of late has advanced under better auspices. It is, however, to be feared, that competition with rival lines may dim its prospects, and retard its progress.

The Old Dominion has at length opened her eyes to the importance of securing a participation in the traffic of the great western valley, and has recently granted a very favorable charter to the Richmond and Ohio road, which it is hoped will induce enterprising capitalists to embrace it with avidity.

Last, though not least in importance, and of the most immediate interest to the southern section of the Union, come the works of South Carolina and Georgia, which now united have nearly reached the southern boundary of Tennessee. An advantageous charter has been granted to the Nashville and Chattanooga railroad company, which promises speedily to commence operations; and this, with the Central railroad, now in contemplation, will complete the communication between the Mississippi river and the Atlantic, at Charleston and Savannah.

These railroads are the iron bands that will bind the various sections of our beloved country together by a community of interest and fraternal feeling, and it is hoped, will render our union indissoluble. The last named of these great public works being of paramount and vital importance to the State of Tennessee, particularly to our portion, it will receive further attention in future numbers."

#### Philadelphia, Wilmington, and Baltimore Railroad Company.

Our readers are aware that for several weeks past an effort has been made on the part of the stockholders and bondholders of this company, for the purpose of relieving it from a large portion of its heavy indebtedness, and improving the condition of the road.

We are happy to state, adds the Gazette, that on the 1st inst. this important and much desired arrangement was fully accomplished, and the debts of the corporation greatly reduced.

The only debt of the Company at this time, is the funded mortgage loan, payable in 1860, and amounting to \$2,161,776 05. The second mortgage loan of £192,500 sterling and the entire floating debt, have been extinguished by a conversion into the stock of the Company at par.

By this arrangement, the annual interest, payable by the Company, is reduced to the sum of seventy thousand dollars. Every note of the Corporation has been paid—and with the large and increasing business of the road, there is now a sure guarantee that its condition will be improved, and the speed of travel increased between the two cities.

The greater portion of the stock of this Company has recently been purchased by capitalists in New England, who have taken it under the conviction that a main line of Railroad, connecting two such cities as Philadelphia and Baltimore, must become productive of handsome profits, if properly improved and equipped, and judiciously managed.

As an earnest of their intention to place the work in an improved condition, we learn that the Iron is now on hand to relay ten miles of track, when the whole line will be continuous heavy edge rail.

This desirable arrangement, which required the unanimous consent of all parties in interest, has been a work of great labor, and we heartily congratulate all the parties and the public upon its successful consummation.

Total amount expended for land, land-damages and fences ..	595,393 62
For locomotives, per last report .....	20,350 95
For locomotives, paid during the past year .....	15,722 41
Total amount expended for locomotives .....	36,073 36
For passenger and baggage cars, per last report .....	13,437 94
For passenger and baggage cars, paid during the past year .....	11,172 44
Total amount expended for passenger and baggage cars .....	24,610 38
For merchandize cars, per last report, [including gravel cars, \$1,700] ..	9,800 00
For merchandize cars, paid during the past year, [including gravel cars, \$2,500] ..	8,722 30
Total amount expended for merchandize cars .....	18,522 30
For engineering and other expenses, per last report ..	18,542 10
For engineering and other expenses, paid during the past year .....	7,070 00
Total amount expended for engineering and other expenses ..	25,612 10
[Amount paid on account of construction of Abington and Bridgewater branch] .....	17,906 95
Total cost of road and equipment .....	\$1,397,058 77

## CHARACTERISTICS OF ROAD.

Length of road .....	37 miles.
Length of single track .....	27 miles.
Length of double track .....	None except turnouts.
Length of branches owned by the company, stating whether they have a single or double track .....	
Weight of rail per yard in main road .....	56 pounds.
Weight of rail per yard in branch roads .....	
Maximum grade, with its length in main road .....	39 6 ft., length 6000 ft.
Maximum grade, with its length in branch roads ..	
Total rise and fall in main road .....	5072 feet.
Total rise and fall in branch roads .....	
Shortest radius of curvature, with length of curve in main road .....	716 ft., length 500 ft.
Shortest radius of curvature, with length of curve in branch roads .....	
Total degrees of curvature in main road .....	790° 30'.
Total degrees of curvature in branch roads .....	
Total length of straight line in main road .....	30 miles, 179 feet.
Total length of straight lines in branches .....	
Aggregate length of truss bridges .....	94 ft. [Branch.
Whole length of road unfinished on both sides .....	6-8 miles, Abington

## DOINGS DURING THE YEAR.

Miles run by passenger trains .....	63,073
Miles run by freight trains .....	22,642
Miles run by other trains .....	19,750
Total miles run .....	105,465
Number of passengers carried in the cars .....	213,144
Number of passengers carried one mile .....	3,459 271
Number of tons of merchandize carried in the cars ..	116,197
Number of tons of merchandize carried one mile ..	229,394
Number of passengers carried one mile, to and from other roads .....	26,225
Number of tons carried one mile, to and from other roads .....	
Average rate of speed adopted for passenger trains, including stops .....	20 miles per hour.
Average rate of speed adopted for freight trains, including stops .....	12½ do.
Estimated weight in tons of passenger trains, including engine and tender, but not including passengers, hauled one mile .....	
Estimated weight of merchandize trains, including engine and tender, but not including freight, hauled one mile .....	

## EXPENDITURES FOR WORKING THE ROAD.

For repairs of road, maintenance of way, exclusive of wooden truss bridges and renewals of iron ..	\$8,604 06
For repairs of truss bridges .....	
For renewals of iron, including laying down .....	
For wages of switch-men, gate-keepers and flag-men .....	
For removing ice and snow .....	
For repairs of fences, gates, houses for flag-men, gate-keepers, switch-men, tool-houses .....	
Total for maintenance of way .....	8,604 06

## MOTIVE POWERS.

For repairs of locomotives .....	2,723 21
For new locomotives to cover depreciation .....	
For repairs of passenger cars .....	1,950 20
For new passenger cars to cover depreciation .....	
For repairs of merchandize cars .....	1,599 63
For new merchandize cars to cover depreciation ..	
For repairs of gravel and other cars .....	
Total for maintenance of motive power .....	6,273 14

## MISCELLANEOUS.

For fuel and oil .....	11,905 65
For salaries, wages and incidental expenses, chargeable to passenger department .....	12,049 50
For salaries, wages and incidental expenses, chargeable to freight department .....	5,959 69
For gratuities and damages .....	655 00
For taxes and insurance .....	210 50
For ferries .....	
For repairs of station building, aqueducts, fixtures, furniture .....	
For interest .....	
For amount paid other companies in tolls for passengers and freight carried on their roads, specifying each company .....	
For amount paid other companies as rent for use of their roads, specifying each company .....	3,000, Worcester railroad.
For salaries of president, treasurer, superintendent, law expenses, office expenses of the above offices, and all other expenses not included in any of the foregoing items .....	8,572 52

## INCOME DURING THE YEAR.

## For Passengers:

1. On the main road exclusively, including branch owned by company .....	101,857 64
2. To and from other roads, specifying what:	

## For Freight:

1. On main road and branches owned by company ..	20,403 95
2. To and from other connecting roads:	
U: S. mails, rents, and miscellaneous expenses .....	3,449 67
Total income .....	125,711 26
Net earnings after deducting expenses .....	68,481 20

## DIVIDENDS.

Surplus not divided .....	63,000 00
Surplus last year .....	5,481 20
Total surplus .....	5,481 20

## ESTIMATED DEPRECIATION BEYOND RENEWALS, VIZ:

Road and bridges .....	
Buildings .....	
Engines and cars .....	

Nathan Carruth, John Sever, Isaac L. Hedge, Jacob H. Loud, William Thomas, Josiah Quincy, Jr., Uriel Crocker.

Railroad to the Pacific.  
 SPEECH OF MR. WHITNEY.  
 (Continued from page 333.)

The last question is answered partly by the answer to the first, that the settlement which must take place, will, of itself, maintain it. And it will be seen that this will be the shortest, cheapest, and most direct route even from Europe to Asia, and all the Islands of the Pacific and Indian Oceans.

Mr. WHITNEY here exhibited a large skeleton map showing our exact position, in the centre of the world, with the Atlantic on one side, and the Pacific on the other side of us. Europe, with her population of 250,000,000, and Asia, with 700,000,000, this road to be the centre of, and thoroughfare for all. He, also, exhibited, and read tables of distances for the present route around the cape, and the distances for routes by proposed canals, all compared with this railroad, which tables are at foot. He, also, explained and described the importance of the commerce of Asia, China particularly, and showed conclusively that it may all be brought on this road. He, also, showed that the expenses of bringing teas and such-like goods from China to New York by this road, the lakes and our canal, would be as low as it now is by ship. He then said:—

The necessity for this road must be manifest to all, as the only means by which almost all the vast country through which it would pass can ever be settled, or made of use to mankind; and as the only means of connexion and intercourse with Oregon, on which subject I will read from the report of Senate's committee, page 13:—

"Another powerful consideration in favor of the proposed road the committee will advert to. It is the probability of the occurrence, that, as the Territory of Oregon, now so distant from us, fills up with an enterprising and industrious people from the several States, they will attract to them settlers from different parts of Europe, all wishing to share in the benefits of our free government, and claiming its protecting care, which cannot be enjoyed or bestowed in full measure, by reason of the difficulty of access by land and by water. A well grounded apprehension seems then to exist, that unless some means like the one proposed, of rapid communication with that region, be devised and completed, that country, soon to become a State of vast proportions and immense political importance, by reason of its position, its own wants, unattended to by this government, will be compelled to establish a separate government—a separate nation—with its cities, ports, and harbors, inviting all the nations of the earth to a free trade with them. From their position, they will control and monopolize the valuable fisheries of the Pacific, control the coast trade of Mexico, South America, and the Sandwich islands, and other islands of the Pacific, of Japan, of China, and of India, and become our most dangerous rival in the commerce of the world. In the opinion of the committee, this road will bind these two great geographical sections indissolubly together, to their mutual advantage, and be the cement of a union which time will but

render more durable, and make it the admiration of the world."

It has been objected that such a work cannot be built and carried on through a wilderness. I answer. If it was not a wilderness I could not have the only means, the lands, for such a work, and I propose to make the work itself change the wilderness, the waste, to cities, towns, villages, and richly cultivated fields. It is also objected, that our country is not old enough and without population to embark in an enterprise so vast. I answer. We have already about 8,000 miles of railroad in operation at a cost or outlay of about \$160,000,000; that our population is at this time 21,000,000, will double in twenty-two years, and if we have been able up to this time, with our small population and smaller means to complete the 8,000 miles, by the double of our population and consequent double of means, we shall be as able to double the miles of railroad; and the comparison is greatly in favor of the future, because many of our present railroads are exclusively means of travel, and have not developed sources of production and wealth. Our increase of population in twenty-two years would give for this road and the Pacific 11,000,000, and leave ten millions for the old State.

But let us see what we want for this road. I make my calculations, and predicate the whole upon the sale and settlement of the 800 miles of the first part; therefore this 800 miles by 60 miles wide, would give 30,720,000 acres. Now allow 160 acres for each family of 5 persons, and it would require 195,000 families, together 960,000 souls. It will require from the commencement five years to complete this 800 miles, (and 15 years the entire) and to sell and settle the 800 miles in 5 years would require per annum 38,400 families, or 192,000 souls; but as it is not necessary to sell and settle more than one half while the entire 800 miles is being built, 19,200 families, or 96,000 souls per annum is all that would be wanted, which is less than 1-7th of our now yearly increase of population; and only about half of what we may expect the yearly emigration from Europe during that period.

It has been my endeavor to show that this road can be built upon the plan I have proposed, and that the means which I have asked for will be made ample only by the road, and I hope I have not failed so to do. But there are other views and opinions to satisfy—there are those, who (perhaps without examination) think or fear, too much may be gained to those who may be interested with me in the work, that it may create much individual power, accumulate lands in individual hands, etc., etc. In answer, I say the land is now worth little or nothing; if of any value hereafter, that value would be derived from the road alone, and those who buy the land on its borders would receive all the benefit; that the lands must be sold and settled, or the road cannot be built; and as the government have 1,000,000,000 millions of acres, there could be no monopoly in sale; if the price demanded too high the lands

would not sell and the road not built; that lands cannot accumulate because the act will provide and fix the time of sale at public auction, and in lots of 40 to 160 acres. As to individual power that can never obtain, because at the will of the people Congress could at any time repeal the act, or make such enactments as would be necessary; and if its management at any time should operate to the disadvantage of the people, why, there could be but one voice against the many, and a change forced to take place. Benefit to myself—I have not undertaken this work with the expectation of benefit to myself; it will probably (if I succeed) require all my life, and were I to gain millions it could do me no good. I have undertaken it for the good of my country first, and after that all mankind, and think if I should live to see its accomplishment, I shall not be disappointed in its results; that it can be completed with the means proposed I am full well persuaded. I think I have examined the subject in all its bearings.

The road being built from the public lands, will, when done, be public property, and not subject to tolls beyond sufficient to keep in repairs and operation; and in order to attain the object we aim at, (to make it the thoroughfare for the commerce of all Asia) it will be necessary to keep it under one general management, so that its operation may be regular and punctual from one end to the other; which I should be directed by Congress, under individual management, the same as the building of the road: Therefore, I propose to keep it in repairs and operation, and I further propose to pay for all the lands at 16 cents per acre—subject to sale as directed by the Act of Congress fixing and regulating the tolls of the road at each session ever afterwards.

I might speculate upon the future, and predict what will be the vast results from the accomplishment of this great work; but it has been my object to give you a plain, simple statement, based upon facts only—and you can see all. The subject is before you. The field is open to the mind, and I think, plain to all. It will open to settlement and cultivation a wilderness more than 2500 miles in extent, giving it free intercourse and rapid communication with all the world. It will so extend agricultural production, and afford exchanges to sustain all other branches of industry, so that I may be almost allowed to say, it will give every man, woman and child the means to live if they will work. It will give us the means, and force the completion of the New York and Erie, the Pennsylvania, the Baltimore and Ohio, the Richmond and Ohio, and the Charleston roads, to Ohio, where they will all join in one, and run on to join this where it crosses the Mississippi, when the grand centre will be near the Missouri, when it will require but 2½ days to any city on the Atlantic, 2½ days to the Pacific, and 25 to any part of the Globe. Thus, we are brought together at the grand centre as one family in 2½ days, and the whole world to the same centre as one nation in 25 days. And it would carry with it from

Ocean to Ocean a belt of population 3400 miles in extent, with the same manners, habits, thoughts, actions, interests, yes, religion, the centre of, and grand thoroughfare for, all the world, a flood of light, life and liberty, which should spread over, enlighten and enliven the heathenism of all Asia.

*Comparison between voyages to be made through a proposed Canal at Nicaragua and those actually made via Cape Horn and the Cape of Good Hope.*

The following calculations are from the authority of Prof. Wittish, of the London University, and calculated from Plymouth, from New York for voyages around the Capes, would vary distance but little, but from New York to the proposed canal, would be 1500 to 2000 miles less:—

**To Valparaizo via Cape Horn.**  
 From Plymouth to the Canaries.....1,400  
 Thence to the region of Calms or 6 deg. N. lat. east of Cape de Verdes.....1,500  
 Thence to the Equator through the Calms....360  
 From the Equator to Cape Frio.....1,500  
 Thence to 40 deg. S. lat.....1,100  
 Thence to Statenland.....1,000  
 From its eastern cape to 60 deg. S. lat. and 65 deg. W. long. and around Cape Horn to 59 deg. W. long.....840  
 Thence to 60 deg. S. long. close to the meridian of 85 deg.....1,250  
 Thence to Valparaizo.....450

Requiring 100 to 117 days.....miles 9,400

**To Valparaizo, via the proposed Canal:—**  
 From Plymouth to 25 deg. N. lat. and 30 deg. W. long.....1,600  
 Thence to the straits between San Lucia and St. Vincent.....2,200  
 Thence to San Juan de Nicoragua.....1,400  
 Passage through the canal.....278  
 From Realejo to Guayaquil.....1,100  
 Thence to Callao.....900  
 Thence to Valparaizo.....1,500

Requiring 100 to 106 days.....miles 8,978

**To Sydney or Australia, via Cape of Good Hope:**

From Plymouth to the Equator, as before....3,260  
 From the Equator to the Island of Trinidad...1,220  
 Thence to the Cape north of Tristan d'Acunha 3,250  
 From the Cape to Bass' Straits between 38 and 40 deg. S. lat.....2,850  
 Thence to Sydney.....450

Requiring 120 to 133 days.....miles 14,030

**To Sydney or Australia, via the proposed Canal:**

From Plymouth to Realejo, through the Canal 5,478  
 Thence to Galapagos Island.....756  
 Thence past the Marquesas to 150 deg. W. long.....3,600  
 Thence to 180 deg. W. long. and 28 deg. S. lat. through the Island.....2,000  
 Thence to Sydney.....2,000

Requiring 105 days.....miles 13,528

From Sydney to Eng., via Cape Horn...13,848 136  
 " " " via Canal.....14,848 138

**To Canton (China) via Cape of Good Hope, during northeast monsoon:—**

From Plymouth to the Cape as before.....7,730  
 Thence past the island of St. Paul's to 110 E. L. and 32 S. L.....4,620  
 Thence to Allas Straits between Lombock and Sumbama.....1,560  
 Thence to Pitt's Straits.....1,230  
 Thence to Pellew Islands.....540  
 Thence to Ballinglang Straits.....600  
 Thence to Canton.....600

Requiring 120 to 150 days.....miles 16,880

**To Canton, via the proposed Canal north-east monsoon:—**

From Plymouth to Realejo through the canal 5,478  
 Thence to Canton between 10 and 20 N. L. through Formosa Straits.....10,360

Requiring 111 days.....miles 15,838

**Homeward, Canton to England, via Cape Good Hope:—**

During southwest monsoon...14,910..110 to 130 days.  
 do to do via Canal S. W. do. 15,558..129 days.

**To Singapore, via the Cape of Good Hope, during southeast monsoon:—**

From Plymouth to the Cape as before.....7,730  
 Thence to Auger Point in Sunda Straits.....6,050  
 Thence to Singapore.....560

Requiring 100 to 130 days.....miles 14,350

**To Singapore, via the proposed canal, during such southeast monsoon:—**

From Plymouth to Realejo through the canal...5,478  
 Thence to the Ladrone.....8,600  
 Thence to Pitt's Straits.....680  
 Thence to Gasper Straits.....2,600  
 Thence to Singapore.....380

Requiring 110 to 130 days.....miles 17,739

**To Singapore, via the Cape, N. E. monsoon, 14,350, 100 to 130 days.**

**To Singapore, via the canal, N. E. monsoon, 16,578, 100 to 117 days.**

The following sailing distances were calculated by Lieut. Maury, at the United States Observatory, Washington:—The distance from New York by proposed railroad to the Pacific is estimated at 3,400 miles, but will probably fall short of that distance. Sixteen miles per hour for freight and thirty for passengers, with one day for delays, is estimated for the railroad, and twelve miles per hour for steamers in the Pacific, etc. with ample time for coaling, detention, etc. In estimating for sail vessels, the freight time on the road is taken.

To calculate from England, 3,000 miles distance, and thirty days for sail and ten for steamers is to be added.

From New York by railroad to Columbia river or to San Francisco, 3,400 miles, eight days for freight, five and a half days for passengers.

**To Japan, via Railroad to the Pacific.**

To the Pacific, as before...3,400 8 54  
 Thence to Japan.....4,000 30 to 35 144

7,400 miles 43 sail 30 steam.

**To Chang-hai in China, at the mouth of the great Yang-tse-keang, which at a short distance from its mouth crosses the great canal at Peking, and where all the commerce of the vast Empire of China centres, and where all the foreign commerce (when this road is opened) will be carried on, is from N. York to the Pacific, as before,**

3,400 8 54  
 Thence to Chang-hai 5,400 35 to 40 90

8,800 miles. 49 sail. 25 steam.

The distance to Canton would be 800 miles greater.

**To Austria, via the proposed railroad.**

From N. Y. to Pacific, as before.....3,400 8 54  
 Thence to Austria, via Sandwich Islands.....6,000 40 22

9,400 mls. 48 sail. 274 steam.

**To Singapore, via the proposed Railroad:**

From N. Y. to Pacific, as before.....3,400 8 54  
 Thence to Singapore, via the Ladrone and other Islands.....6,660 50 25

10,060 mls. 58 sail. 304 steam.

All the commerce of the Pacific and Indian Oceans may be carried on in steamers from Oregon, because the steamers could be supplied with fuel (coal) from Oregon, (Vancouver's Island particularly) Japan, China, as low down as Formosa and Australia. But for any other route the fuel (coal) must be taken from England or the Northern States, and the long voyages to China, to Australia and Singapore would require fuel beyond the capacity to carry.

#### ITEMS.

**New Fashioned Railroad.**—M. Audrand, an individual well known in Paris for his unremitting exertions, for the last seven years, to perfect a system of railroad travelling by means of compressed air, seems at length in a fair way to succeed, he has laid down a way 100 yards long, upon which a carriage, built for the purpose, is impelled, upon his new principle, with an ease and smoothness heretofore not attained on the ordinary railroads. There is no locomotive necessary to move it, inasmuch as this is accomplished through a tube laid in the centre of the road, with a pipe by its side, which keeps up the motive power. This system, the inventor undertakes to show, is vastly preferable in all respects, to that of the atmospheric. It combines all of its advantages, while it is subject to none of its imperfections. It unites entire safety with the capacity to run 15 to 50 miles per hour. The cost of keeping it in motion is stated to be less than one-half of that of engine-propelled carriages. We can place but little confidence in the invention, however, without having some definite description of its peculiarities of construction.

**Iron Trade of America.**—There are no data by which we can ascertain the quantity of iron produced in the United States, prior to 1810. At that time, according to the official returns, the quantity of bar iron made in this country was 24,471 tons, then valued at \$2,640,778, of which 10,969 tons were made in Pennsylvania. From that time to 1830, the quantity had increased to 112,866 tons; in addition to which, 25,250 tons of castings were also made—the value of both amounted to \$13,323,760; in making this quantity 29,254 men were employed, and 146,273 subsisted, whose annual wages amounted to \$8,776,420, and that in their support the farmer furnished food to the value of 4,000,400 dollars.

The average quantity of hammered iron imported into the United States from 1821 to 1830, was about 26,200 tons annually, and of rolled iron about 5600 tons—making, together, 31,800 tons, and valued at 1,762,000 dollars.

The whole quantity of hammered and rolled iron consumed in the United States in 1830, may be estimated at about 144,666 tons.—

Railroad to the Pacific.  
 SPEECH OF MR. WHITNEY.  
 (Continued from page 333.)

The last question is answered partly by the answer to the first, that the settlement which must take place, will, of itself, maintain it. And it will be seen that this will be the shortest, cheapest, and most direct route even from Europe to Asia, and all the Islands of the Pacific and Indian Oceans.

Mr. WHITNEY here exhibited a large skeleton map showing our exact position, in the centre of the world, with the Atlantic on one side, and the Pacific on the other side of us. Europe, with her population of 250,000,000, and Asia, with 700,000,000, this road to be the centre of, and thoroughfare for all. He, also, exhibited, and read tables of distances for the present route around the cape, and the distances for routes by proposed canals, all compared with this railroad, which tables are at foot. He, also, explained and described the importance of the commerce of Asia, China particularly, and showed conclusively that it may all be brought on this road. He, also, showed that the expenses of bringing teas and such-like goods from China to New York by this road, the lakes and our canal, would be as low as it now is by ship. He then said:—

The necessity for this road must be manifest to all, as the only means by which almost all the vast country through which it would pass can ever be settled, or made of use to mankind; and as the only means of connexion and intercourse with Oregon, on which subject I will read from the report of Senate's committee, page 13:—

"Another powerful consideration in favor of the proposed road the committee will advert to. It is the probability of the occurrence, that, as the Territory of Oregon, now so distant from us, fills up with an enterprising and industrious people from the several States, they will attract to them settlers from different parts of Europe, all wishing to share in the benefits of our free government, and claiming its protecting care, which cannot be enjoyed or bestowed in full measure, by reason of the difficulty of access by land and by water. A well grounded apprehension seems then to exist, that unless some means like the one proposed, of rapid communication with that region, be devised and completed, that country, soon to become a State of vast proportions and immense political importance, by reason of its position, its own wants, unattended to by this government, will be compelled to establish a separate government—a separate nation—with its cities, ports, and harbors, inviting all the nations of the earth to a free trade with them. From their position, they will control and monopolize the valuable fisheries of the Pacific, control the coast trade of Mexico, South America, and the Sandwich islands, and other islands of the Pacific, of Japan, of China, and of India, and become our most dangerous rival in the commerce of the world. In the opinion of the committee, this road will bind these two great geographical sections indissolubly together, to their mutual advantage, and be the cement of a union which time will but

render more durable, and make it the admiration of the world."

It has been objected that such a work cannot be built and carried on through a wilderness. I answer. If it was not a wilderness I could not have the only means, the lands, for such a work, and I propose to make the work itself change the wilderness, the waste, to cities, towns, villages, and richly cultivated fields. It is also objected, that our country is not old enough and without population to embark in an enterprise so vast. I answer. We have already about 8,000 miles of railroad in operation at a cost or outlay of about \$160,000,000; that our population is at this time 21,000,000, will double in twenty-two years, and if we have been able up to this time, with our small population and smaller means to complete the 8,000 miles, by the double of our population and consequent double of means, we shall be as able to double the miles of railroad; and the comparison is greatly in favor of the future, because many of our present railroads are exclusively means of travel, and have not developed sources of production and wealth. Our increase of population in twenty-two years would give for this road and the Pacific 11,000,000, and leave ten millions for the old State.

But let us see what we want for this road. I make my calculations, and predicate the whole upon the sale and settlement of the 800 miles of the first part; therefore this 800 miles by 60 miles wide, would give 30,720,000 acres. Now allow 160 acres for each family of 5 persons, and it would require 195,000 families, together 960,000 souls. It will require from the commencement five years to complete this 800 miles, (and 15 years the entire) and to sell and settle the 800 miles in 5 years would require per annum 38,400 families, or 192,000 souls; but as it is not necessary to sell and settle more than one half while the entire 800 miles is being built, 19,200 families, or 96,000 souls per annum is all that would be wanted, which is less than 1-7th of our now yearly increase of population; and only about half of what we may expect the yearly emigration from Europe during that period.

It has been my endeavor to show that this road can be built upon the plan I have proposed, and that the means which I have asked for will be made ample only by the road, and I hope I have not failed so to do. But there are other views and opinions to satisfy—there are those, who (perhaps without examination) think or fear, too much may be gained to those who may be interested with me in the work, that it may create much individual power, accumulate lands in individual hands, etc., etc. In answer, I say the land is now worth little or nothing; if of any value hereafter, that value would be derived from the road alone, and those who buy the land on its borders would receive all the benefit; that the lands must be sold and settled, or the road cannot be built; and as the government have 1,000,000,000 millions of acres, there could be no monopoly in sale; if the price demanded too high the lands

would not sell and the road not built; that lands cannot accumulate because the act will provide and fix the time of sale at public auction, and in lots of 40 to 160 acres. As to individual power that can never obtain, because at the will of the people Congress could at any time repeal the act, or make such enactments as would be necessary; and if its management at any time should operate to the disadvantage of the people, why, there could be but one voice against the many, and a change forced to take place. Benefit to myself—I have not undertaken this work with the expectation of benefit to myself; it will probably (if I succeed) require all my life, and were I to gain millions it could do me no good. I have undertaken it for the good of my country first, and after that all mankind, and think if I should live to see its accomplishment, I shall not be disappointed in its results; that it can be completed with the means proposed I am full well persuaded. I think I have examined the subject in all its bearings.

The road being built from the public lands, will, when done, be public property, and not subject to tolls beyond sufficient to keep in repairs and operation; and in order to attain the object we aim at, (to make it the thoroughfare for the commerce of all Asia) it will be necessary to keep it under one general management, so that its operation may be regular and punctual from one end to the other; which I should be directed by Congress, under individual management, the same as the building of the road: Therefore, I propose to keep it in repairs and operation, and I further propose to pay for all the lands at 16 cents per acre—subject to sale as directed by the Act of Congress fixing and regulating the tolls of the road at each session ever afterwards.

I might speculate upon the future, and predict what will be the vast results from the accomplishment of this great work; but it has been my object to give you a plain, simple statement, based upon facts only—and you can see all. The subject is before you. The field is open to the mind, and I think, plain to all. It will open to settlement and cultivation a wilderness more than 2500 miles in extent, giving it free intercourse and rapid communication with all the world. It will so extend agricultural production, and afford exchanges to sustain all other branches of industry, so that I may be almost allowed to say, it will give every man, woman and child the means to live if they will work. It will give us the means, and force the completion of the New York and Erie, the Pennsylvania, the Baltimore and Ohio, the Richmond and Ohio, and the Charleston roads, to Ohio, where they will all join in one, and run on to join this where it crosses the Mississippi, when the grand centre will be near the Missouri, when it will require but 2½ days to any city on the Atlantic, 2½ days to the Pacific, and 25 to any part of the Globe. Thus, we are brought together at the grand centre as one family in 2½ days, and the whole world to the same centre as one nation in 25 days. And it would carry with it from

Ocean to Ocean a belt of population 3400 miles in extent, with the same manners, habits, thoughts, actions, interests, yes, religion, the centre of, and grand thoroughfare for, all the world, a flood of light, life and liberty, which should spread over, enlighten and enliven the heathenism of all Asia.

*Comparison between voyages to be made through a proposed Canal at Nicaragua and those actually made via Cape Horn and the Cape of Good Hope.*

The following calculations are from the authority of Prof. Wittish, of the London University, and calculated from Plymouth, from New York for voyages around the Capes, would vary distance but little, but from New York to the proposed canal, would be 1500 to 2000 miles less:—

To Valparaizo via Cape Horn.	
From Plymouth to the Canaries.....	1,400
Thence to the region of Calms or 6 deg. N. lat. east of Cape de Verds.....	1,500
Thence to the Equator through the Calms.....	360
From the Equator to Cape Frio.....	1,500
Thence to 40 deg. S. lat.....	1,100
Thence to Statenland.....	1,000
From its eastern cape to 60 deg. S. lat. and 65 deg. W. long. and around Cape Horn to 89 deg. W. long.....	840
Thence to 60 deg. S. long. close to the meridian of 85 deg.....	1,250
Thence to Valparaizo.....	450

Requiring 100 to 117 days.....miles 9,400

To Valparaizo, via the proposed Canal:—	
From Plymouth to 25 deg. N. lat. and 30 deg. W. long.....	1,600
Thence to the straits between San Lucia and St. Vincent.....	2,200
Thence to San Juan de Nicoragua.....	1,400
Passage through the canal.....	278
From Realejo to Guayaquil.....	1,100
Thence to Callao.....	900
Thence to Valparaizo.....	1,500

Requiring 100 to 106 days.....miles 8,978

To Sydney or Australia, via Cape of Good Hope:	
From Plymouth to the Equator, as before.....	3,260
From the Equator to the Island of Trinidad.....	1,220
Thence to the Cape north of Tristan d'Acunha.....	3,250
From the Cape to Bass' Straits between 38 and 40 deg. S. lat.....	2,850
Thence to Sydney.....	450

Requiring 120 to 133 days.....miles 14,030

To Sydney or Australia, via the proposed Canal:	
From Plymouth to Realejo, through the Canal.....	5,478
Thence to Galapagos Island.....	756
Thence past the Marquesas to 150 deg. W. long.....	3,600
Thence to 180 deg. W. long. and 28 deg. S. lat. through the Island.....	2,000
Thence to Sydney.....	2,000

Requiring 105 days.....miles 13,528

From Sydney to Eng., via Cape Horn.....	13,848	136
" " " via Canal.....	14,848	138

To Canton (China) via Cape of Good Hope, during northeast monsoon:—	
From Plymouth to the Cape as before.....	7,730
Thence past the island of St. Paul's to 110 E. L. and 32 S. L.....	4,620
Thence to Allas Straits between Lombeck and Sumbana.....	1,560
Thence to Pitt's Straits.....	1,230
Thence to Pellew Islands.....	540
Thence to Ballinglang Straits.....	600
Thence to Canton.....	600

Requiring 120 to 150 days.....miles 16,880

To Canton, via the proposed Canal north-east monsoon:—

From Plymouth to Realejo through the canal.....	5,478
Thence to Canton between 10 and 20 N. L. through Formosa Straits.....	10,360

Requiring 111 days.....miles 15,838

Homeward, Canton to England, via Cape Good Hope:—

During southwest monsoon..14,910.110 to 130 days. do to do via Canal S. W. do. 15,558..129 days.

To Singapore, via the Cape of Good Hope, during southeast monsoon:—

From Plymouth to the Cape as before.....	7,730
Thence to Auger Point in Sunda Straits.....	6,050
Thence to Singapore.....	560

Requiring 100 to 130 days.....miles 14,350

To Singapore, via the proposed canal, during such southeast monsoon:—

From Plymouth to Realejo through the canal.....	5,478
Thence to the Ladrone.....	8,600
Thence to Pitt's Straits.....	680
Thence to Gaspar Straits.....	2,600
Thence to Singapore.....	380

Requiring 110 to 130 days.....miles 17,739

To Singapore, via the Cape, N. E. monsoon, 14,350, 100 to 130 days.

To Singapore, via the canal, N. E. monsoon, 16,578, 100 to 117 days.

The following sailing distances were calculated by Lieut. Maury, at the United States Observatory, Washington:—The distance from New York by proposed railroad to the Pacific is estimated at 3,400 miles, but will probably fall short of that distance. Sixteen miles per hour for freight and thirty for passengers, with one day for delays, is estimated for the railroad, and twelve miles per hour for steamers in the Pacific, etc. with ample time for coaling, detention, etc. In estimating for sail vessels, the freight time on the road is taken.

To calculate from England, 3,000 miles distance, and thirty days for sail and ten for steamers is to be added.

From New York by railroad to Columbia river or to San Francisco, 3,400 miles, eight days for freight, five and a half days for passengers.

To Japan, via Railroad to the Pacific.

To the Pacific, as before.....	3,400	8	5½
Thence to Japan.....	4,000	30 to 35	14½
	7,400 miles	43 sail	20 steam.

To Chang-hai in China, at the mouth of the great Yang-tse-keang, which at a short distance from its mouth crosses the great canal at Pekin, and where all the commerce of the vast Empire of China centres, and where all the foreign commerce (when this road is opened) will be carried on, is from N. York to the Pacific, as before,

	3,400	8	5½
Thence to Chang-hai.....	5,400	35 to 40	20

8,800 miles. 48 sail. 25 steam.

The distance to Canton would be 800 miles greater.

To Austria, via the proposed railroad.

From N. Y. to Pacific, as before.....	3,400	8	5½
Thence to Austria, via Sandwich Islands.....	6,000	40	22

9,400 mls. 48 sail. 27½ steam.

To Singapore, via the proposed Railroad:

From N. Y. to Pacific, as before.....	3,400	8	5½
Thence to Singapore, via the Ladrone and other Islands.....	6,660	50	25
	10,060 mls.	58 sail.	30½ steam.

All the commerce of the Pacific and Indian Oceans may be carried on in steamers from Oregon, because the steamers could be supplied with fuel (coal) from Oregon, (Vancouver's Island particularly) Japan, China, as low down as Formosa and Australia. But for any other route the fuel (coal) must be taken from England or the Northern States, and the long voyages to China, to Australia and Singapore would require fuel beyond the capacity to carry.

#### ITEMS.

*New Fashioned Railroad.*—M. Audrand, an individual well known in Paris for his unremitting exertions, for the last seven years, to perfect a system of railroad travelling by means of compressed air, seems at length in a fair way to succeed, he has laid down a way 100 yards long, upon which a carriage, built for the purpose, is impelled, upon his new principle, with an ease and smoothness heretofore not attained on the ordinary railroads. There is no locomotive necessary to move it, inasmuch as this is accomplished through a tube laid in the centre of the road, with a pipe by its side, which keeps up the motive power. This system, the inventor undertakes to show, is vastly preferable in all respects, to that of the atmospheric. It combines all of its advantages, while it is subject to none of its imperfections. It unites entire safety with the capacity to run 15 to 50 miles per hour. The cost of keeping it in motion is stated to be less than one-half of that of engine-propelled carriages. We can place but little confidence in the invention, however, without having some definite description of its peculiarities of construction.

*Iron Trade of America.*—There are no data by which we can ascertain the quantity of iron produced in the United States, prior to 1810. At that time, according to the official returns, the quantity of bar iron made in this country was 24,471 tons, then valued at \$2,640,778, of which 10,969 tons were made in Pennsylvania. From that time to 1830, the quantity had increased to 112,866 tons; in addition to which, 25,250 tons of castings were also made—the value of both amounted to \$13,323,760; in making this quantity 29,254 men were employed, and 146,273 subsisted, whose annual wages amounted to \$8,776,420, and that in their support the farmer furnished food to the value of 4,000,490 dollars.

The average quantity of hammered iron imported into the United States from 1821 to 1830, was about 26,200 tons annually, and of rolled iron about 5600 tons—making, together, 31,800 tons, and valued at 1,762,000 dollars.

The whole quantity of hammered and rolled iron consumed in the United States in 1830, may be estimated at about 144,666 tons.—

The value of the various foreign manufactures of iron consumed in this country, on an average, from 1821 to 1830, was about 4,000,000 dollars yearly, making the whole amount of foreign iron and it manufactures annually consumed in the United States, say 5,762,000 dollars. If the whole quantity made in the United States in 1830, were computed in pig iron, it would amount to 191,736 tons—produced from 239 furnaces, averaging fifteen and a half tons each furnace per week—two-fifths of this quantity were made in Pennsylvania. The quantity made in all the States in 1837 may be fairly taken at 250,000 tons.—*Scribner's History of the Iron Trade.*

**Improved Vertical Water Wheel.**—Of the numerous recent improvements, or at least variations and modifications of water wheels, nineteen-twentieths of them have been on horizontal motions while the vertical motion—which is in most general use—has been comparatively overlooked. But we have recently examined the plan of a vertical wheel invented by Mr. W. C. Burbank, of Flatbush, N. Y., which appears likely to supersede to great extent, both the overshot and breast wheel for heavy water powers. The plan is decidedly novel and will evidently give more power, by five or ten per cent. than the overshot. We had thought of procuring an engraving, but that not being immediately convenient, we shall attempt a brief description without it. This may be called the vertical drum wheel, the periphery being close and without any appearance of buckets. It has a second close drum periphery within the first, from 10 to 20 inches distant, according to the quantity of water to be used. Between these two peripheries are arranged a series of buckets, constructed in the form of a V, with the angle in the centre. The space between the buckets is open at the sides of the wheel, and the water is supplied and discharged through these open spaces on both sides. Of course, whatever momentum there may be in the feeding current, is exerted on the wheel, and the water cannot escape till it reaches the lowest point of the circle, and then leaves the wheel freely, and without resistance.—*N. Y. Farmer and Mechanic.*

**Hydraulic Invention.**—A Mr. Steele, of Swansea, England, has invented a valve pipe for the purpose of trying whether as in the method in which our blood circulates, water can be raised to any height from the power of waves exerted upon a surface of water.—That this method will be useless for practical purposes, we have no doubt, as the power required to make the waves that would raise the water to any given height, would be far more economically expended by the force pump.

**American Iron.**—The Rochester Democrat states that iron was first made in this country in 1715, in Virginia. In Orange County, New York, a furnace was erected in 1751, and 1500 tons of pig, and 1000 tons of bar made annually. The great iron chain that crossed the Hudson river during the revolution, each link of which weighed 140 pounds, was made there. Peter Townsend made the first cannon there in 1816.

## BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

## MISSING NUMBERS OF THE RAILROAD JOURNAL.

Subscribers, who wish to obtain Missing Numbers of Back Volumes of this Journal, will do well to apply immediately.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

**NOTICE TO CONTRACTORS.—ANDROSCOGGIN AND KENNEBEC RAILROAD.** Proposals will be received at the Railroad Office, in Lewiston, until the 17th of June next, for the Grading and Masonry of the 1st Division of the Road, extending from the Atlantic and St. Lawrence Road in Danville, to Green centre, 14½ miles.

Also, separately, for the Masonry and Woodwork of the Bridges across the Great and Little Androscoggin Rivers, the Bridges to be constructed on Towne's plan.

Plans and Profiles will be ready for examination, and the route shown, on and after the 10th of June.

Satisfactory securities will be required of bidders unknown to the officers of the company.

The 2d Division, extending to Snow's Pond in Belgrade, 25 miles, will be ready for contract about the 25th of July; and the remainder of the road to Waterville, about the 20th of September.

HOBERT CLARK, Agent A. & K. R. R.  
EDWARD APPLETON, Engineer.

Railroad Office, Lewiston, May 8, 1847. 4t21

**CHAMPLAIN & CONNECTICUT RIVER RAILROAD.**—Notice to Contractors.—Proposals will be received until the 1st day of June, 1847, for the Grading, Masonry and Bridging of that part of the Champlain and Connecticut River Railroad, extending from the west side of the summit at Mt. Holly to the Village of Brandon, a distance of about 34 miles, and being the whole uncontracted portion of said road.

Maps, Profiles and Specifications may be found after the 20th of May next at the Office of the Engineer in Rutland, where every necessary information will be given.

The line will be divided in sections of convenient length for construction, and from those to whom the work may be awarded, satisfactory security will be required.

Proposals may be left with the undersigned, at Burlington—with George T. Hodges, Esq., at Rutland—or with William Henry, Esq., at Bellows Falls.

The work will be awarded at Rutland, as soon after the 1st of June, as the necessary examination of the bids can be made. By order of the Board,

T. FOLLETT, President.  
Office of the C. & C. R. R. Co.,  
Burlington, Vt., April 29, 1847. 3t20

THE SUBSCRIBER has on hand a good assortment of his best Leveling and Surveying Instruments, among them his improved Compass for taking angles without the needle—also Bells, suitable for Churches, Railroad Depots, etc.

ANDREW MENEELY.  
West Troy, May 12, 1847. 1y+21

**PIG AND BLOOM IRON.**—THE SUBSCRIBERS are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of iron is solicited by

A. WRIGHT & NEPHEW,  
Vine St. Wharf, Philadelphia. 12t

**RAILROAD IRON.—THE "MONTGOMERY" Iron Company,** Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to  
MURDOCK, LEAVITT & CO.,  
Agents.  
1y48 77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC Cement.** This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper-barrels, by JOHN W. LAWRENCE,  
142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 33 1y

**A. & G. RALSTON & CO., NO. 4**  
South Front St., Philadelphia, Pa.

Have now on hand, for sale, Railroad Iron, viz: 180 tons 2½ x 1 inch Flat Punched Rails, 20 ft. long. 25 " 2½ x 1 " Flange Iron Rails. 75 " 1 x 1 " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures. 11f

## LOCOMOTIVE AND CAR AXLES.

The Subscribers are now prepared to receive orders for the well known and approved Reading Locomotive and Car Axles—drawn to any required pattern from Bloom Iron only. Address

SAM'L KIMBER & CO.,  
Willow Street Wharf,  
Philadelphia, Pa. 4t

## RAILROAD IRON.—THE NEW JERSEY

Iron Company, Boonton, N. J., are now preparing to make Railroad Bars, and are ready to take orders or make contracts for Rails, deliverable after the first of December next. Apply to

FULLER & BROWN, Agent.  
No. 139 Greenwich, corner of Cedar street.  
September 18, 1846. 10t39

## RAILWAY IRON.—DAVIS, BROOKS

& CO., No. 68 Broad Street, have now in port on Ship-board, 200 Tons of the best English heavy H Rails, 60 lbs. to the lineal yard, which they offer for sale on favorable terms, also, about 6 to 700 Tons now on the way, to arrive shortly, of the same description of Rail. 46t

## TO CONTRACTORS.—KENNEBEC AND

PORTLAND RAILROAD.—Proposals will be received at this office until the 15th of May, for the Grading and Masonry of 28 miles of this road, extending from North Yarmouth to Bowdoinham, and the Branch Road from Brunswick to Bath, including the masonry for the Bridges across the Androscoggin, New Meadows and Cathance rivers. The line of road and the plans and profiles will be ready for examination on the 10th of May; after which time any information in relation to the work can be had at this office, or of the Resident Engineers on the line of the road.

Persons unknown to the officers of the company, must accompany their bids with satisfactory evidence of their ability to execute the work.

The remainder of the line from Bowdoinham to Augusta, 21 miles, will be ready for contract about the 15th of June; of which due notice will be given.

GEO. S. GREENE, Eng. K. & P. R. R.  
ENGINEERS OFFICE, K. & P. R. R.,  
Brunswick, Me., April 6, 1847. 1m16

## THE SUBSCRIBER IS PREPARED TO

execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip.  
New York. 1y10

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed.]

WILLIAM ROE, Sup't of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed.] G. A. NICOLL,

Sup't Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed.] T. L. SMITH,

Jersey City, November 4, 1845. N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot, }

[Signed.] JOHN LEACH,

Jamaica November 12, 1845. }

1y19 Sup't Motive Power.

## ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—

for sale or imported to order by the subscriber. These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,

75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.		Weight per fathom.	Diameter of iron.	
	INCH.	LBS. OZ.	INCH.	LBS. OZ.		LBS.	INCH.	Tons.
11	4½	13 5	10	24 -		50	15-16	20
13	3½	8 3	8½	16 -		27	11-16	13½
14	3½	6 11	7½	12 8		17	9-16	10½
15	2½	5 2	6½	9 4		13½	1-2	7½
16	2½	4 3	6	8 8		10½	7-16	7

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1y24

## THE SUBSCRIBERS, AGENTS FOR

the sale of  
Codorus,  
Glendon,  
Spring Mill and  
Valley, } Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

SAM'L KIMBER, & CO.,  
59 North Wharves,  
Jan. 14, 1846. [1y4] Philadelphia, Pa.

**RAILWAY IRON.—THE BEST QUALITY** of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by

DAVIS, BROOKS & CO.,  
Jan. 2. [1lf] 68 Broad St., New York.

## RAILROAD SCALES.—THE ATTEN-

tion of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLICOTT & ABBOTT.

Factory, 9th street, near Coates, cor. Melon st.  
Office, No. 3 North 5th street,  
Philadelphia, Pa.

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee  
G. A. NICOLLS,  
Reading, Pa.

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside. THOMAS & EDMUND GEORGE,  
245 N. E. cor. 19th and Market sts., Philad., Pa.

**RAILROAD IRON.—THE SUBSCRIBER'S** New Rail Iron Mill at Phoenixville, Pa., is expected to be ready to go into operation by the 1st of September, and will be capable of turning out 30 to 40 tons or finished Rails per day. They are now prepared to receive orders to that extent, deliverable after the 1st of October next, for heavy rails of any pattern now in use, equal in quality and finish to best imported.

**PIG IRON.**—They are also receiving weekly 150 to 200 tons of No. 1 Phoenix Foundry Iron, well adapted for light castings.

REEVES, BUCK & CO.,  
45 North Water St., Philadelphia,  
or by their Agent, ROBT. NICHOLS,  
79 Water St., New York.

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

### THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.		
4,324 Timbers, 11 ft. long, 3 x 6 inches =	68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs. at 4½ cts. =		101 25
Workmanship free of patent charge =		600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

**JAMES HERRON.**

Civil Engineer and Patentee.

No. 277 South Tenth St., Philadelphia. 331

### FRANKLIN HOUSE,

No. 105 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,

D. K. MINOR.

## BOSTON AND MAINE RAILROAD.

Upper Route, to Portland and the East.

SUMMER ARRANGEMENT, April 1, 1847.

### PORTLAND TRAINS.

Leave Boston at 7 A.M. and 2½ P.M.

Leave Portland at 7½ A.M. and 3 P.M.

### GREAT FALLS TRAIN.

Leave Boston at 5 P.M.

Leave Great Falls at 6½ A.M.

### HAVERHILL TRAINS.

Leave Boston at 11½ A.M. and 6-20 P.M.

Leave Haverhill at 6½ A.M. and 1½ P.M.

### READING TRAINS.

Leave Boston at 8½ A.M. and 8½ P.M.

Leave Reading at 6 A.M. and 1½ P.M.

### MEDFORD BRANCH TRAINS.

Leave Boston at 7½, 11½ A.M., 3½, 5½, 7 P.M.

Leave Medford at 6½, 8 A.M., 1½, 4½, 6 P.M.

The Depot in Boston is on Haymarket Square.

Passengers are not allowed to carry Baggage above \$50 in value, and that personal, unless notice is given, and an extra amount paid, at the rate of the price of a Ticket for every \$500 additional value.

1y31

CHAS. MINOT, Super't.

## SUMMER ARRANGEMENT.—NEW YORK AND ERIE RAILROAD LINE, from April

1st until further notice, will run daily (Sundays excepted) between the city of New York and Middletown, Goshen, and intermediate places, as follows:

### FOR PASSENGERS—

Leave New York at 7 A.M. and 4 P.M.

" Middletown at 6½ A.M. and 5½ P.M.

FARE REDUCED TO \$1.25 to Middletown—way in proportion. Breakfast, supper and berths can be had on the steamboat.

### FOR FREIGHT—

Leave New York at 5 P.M.

" Middletown at 12 M.

The names of the consignee and of the station where to be left, must be distinctly marked upon each article shipped. Freight not received after 5 P.M. in New York.

Apply to J. F. Clarkson, agent, at office corner of Duane and West sts. H. C. SEYMOUR, Sup't. March 25th, 1846.

Stages run daily from Middletown, on the arrival of the afternoon train, to Milford, Carbondale, Honesdale, Montrose, Towanda, Owego, and West; also to Monticello, Windsor, Binghamton, Ithaca, etc., etc. Agent on board. 13 tf

## NORWICH AND WORCESTER RAILROAD.

Summer Arrangement. Change of Hours. Commencing on

Wednesday, April 21, 1847.

Accommodation Trains, daily, (except Sunday.) Leave Norwich, at 6 a.m., and 4½ p.m. Leave Worcester, at 8½ a.m., and 4½ p.m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston, and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 2½ p.m. train from Boston.

New York Train via Steamboat—Leave Norwich for Boston, every morning, except Monday, on the arrival of the steamboat from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 6½ p.m., daily, except Sunday, stopping at Danielsonville and Norwich.

Freight Trains daily each way, except Sunday. Leave Norwich at 7, and Worcester at 6 30 a.m. Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are Less when paid for Tickets than when paid in the Cars. J. W. STOWELL, Sup't.

**LITTLE MIAMI RAILROAD.—OPEN TO SPRINGFIELD—Distance 84 miles—**

connecting at Xenia and Springfield with Messrs. Neil, Moore, & Co's. daily daylight lines of stages going east and north, to Columbus, Zanesville, Wheeling, Cleveland, and Sandusky City. via Urbana, Bellefontaine, Kenton, and the Mad river and lake Erie railroad, or Columbus, Delaware, and the Mansfield and Sandusky City railroad—forming, by these connections, the cheapest and most expeditious route to Buffalo, Niagara Falls, Rochester, Albany, New York, and Boston.

On and after Thursday, August 13, 1846, until further notice, a Passenger train will run as follows: Leave Cincinnati daily at 9 A. M., for Millford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Old Town, Yellow Springs, and Springfield.

Returning, will leave Springfield at 4 hours 35 minutes A. M. A line of Hacks runs in connection with the Cars, between Deerfield and Lebanon.

FARE—From Cincinnati to Lebanon	\$1 00
" " " Xenia	1 50
" " " Springfield	2 00
" " " Columbus	4 00
" " " Sandusky city	8 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company, on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at of a passage for every \$500 in value over that amount.

The 14 P. M. train from Cincinnati, and the 2 40 P. M. train from Xenia, will be discontinued on and after Monday, the 10th instant.

A freight train will run daily.

471f W. H. CLEMENT, Sup't.

**BALTIMORE AND OHIO RAILROAD. MAIN STEM.** The Train carrying the Great Western Mail leaves Bal-

timore every morning at 7½ and Cumberland at 8 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburgh and Hancock, connecting daily each way with—the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Pittsburgh. Time of arrival at both Cumberland and Baltimore 5½ P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pittsburgh \$10, and time about 32 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$12. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

**WASHINGTON BRANCH.**

Daily trains at 9 A. M. and 5 P. M. and 12 at night from Baltimore and at 6 A. M. and 5½ P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. 131y1

**MANUFACTURE OF PATENT WIRE**

Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by JOHN A. ROEBLING, Civil Engineer, Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition. 2v19 1y

**BALTIMORE AND SUSQUEHANNA Railroad.**—Reduction of Fare, Morning and Afternoon Trains between Balti-

more and York.—The Passenger trains run daily, except Sunday, as follows: Leaves Baltimore at.....9 a.m. and 3½ p.m. Arrives at.....9 a.m. and 6½ p.m. Leaves York at.....5 a.m. and 3 p.m. Arrives at.....12½ p.m. and 8 p.m. Leaves York for Columbia at.....1½ p.m. and 8 a.m. Leaves Columbia for York at.....8 a.m. and 2 p.m.

**FARE.**

Fare to York	\$1 50
" Wrightsville	2 00
" Columbia	2 12½

Way points in proportion.

**PITTSBURG, GETTYSBURG AND HARRISBURG.**

Through tickets to Pittsburg via stage to Harrisburg.....\$9  
Or via Lancaster by railroad.....10  
Through tickets to Harrisburg or Gettysburg...3  
In connection with the afternoon train at 3½ o'clock, a horse car is run to Green Spring and Owning's Mill, arriving at the Mills at.....5½ p.m. Returning, leaves Owning's Mills at.....7 a.m.

D. C. H. BORDLEY, Sup't.

Ticket Office, 63 North st.

**CENTRAL RAILROAD—FROM SAVANNAH to Macon. Distance 190 miles.**

This Road is open for the transportation of Passengers and Freight.

Rates of Passage, \$8 00. Freight—  
On weight goods generally.....50 cts. per hundred.  
On measurement goods.....13 cts. per cubic ft.  
On brls. wet (except molasses and oil).....\$1 50 per barrel.  
On brls. dry (except lime)....80 cts. per barrel.  
On iron in pigs or bars, castings for mills, and unboxed machinery.....40 cts. per hundred.  
On hhd. and pipes of liquor, not over 120 gallons.....\$5 00 per hhd.  
On molasses and oil.....\$6 00 per hhd.  
Goods addressed to F. WINTER, Agent, forwarded free of commission. THOMAS PURSE, y40 Gen'l. Sup't. Transportation.

**NEW YORK & HARLEM RAILROAD CO.—Winter Arrangement.**

On and after Monday, November 23, 1846, the cars will run as follows:

Leave 27th street for 43d street, Deaf and Dumb Institute, Yorkville, Harlem Morrianna, and Williams' Bridge, at 7 o'clock a.m. From City Hall for above named places, 2 p.m. [freight train], 2 30 p.m. 5 p.m. to Morrisania only.

Leave City Hall for Harlem, Morrisania, Fordham and Williams' Bridge, at 7 45 a.m., and 10 45 a.m.; 1 15 p.m., 2 p.m. [freight train], 2 30 p.m. and 3 45 p.m.

Leave City Hall for Hunt's Bridge, Bronx, Tuckahoe, Hart's Corners White Plains, Davis' Brook, Unionville and Pleasantville, [Pleasantville 4 miles from Sing Sing,] 7 45 and 10 45 a.m.; 1 15 p.m., 2 p.m. [freight train], and 3 45 p.m.

**RETURNING.**

Leave Pleasantville, at 8, 10, [freight train], and 11 a.m.; 1 30, and 4 p.m.

Leave White Plains, at 8 12, 10 30, [freight train] and 11 20 a.m.; 1 50, and 4 20 p.m.

Leave Tuckahoe, 8 35, 10 55, [freight train,] and 11 35 a.m.; 2 05, and 4 35 p.m.

Leave Williams' Bridge at 7 45, 8 50 and 11 50 a.m.; 2 40, 4, and 4 50 p.m.

Leave Morrisania 8 and 9 05 a.m.; 12 05, 2 35, 4 20, 5 05 and 6 p.m.

Leave Yorkville, at 8 12 a.m.; 4 35 and 6 15 p.m.

**SUNDAY ARRANGEMENTS.**

Leave City Hall for Pleasantville and intermediate places, at 7 45 a.m.; 1 15 and 3 p.m.

Leave Pleasantville for City Hall, at 8 a.m.; 11, and 3 15 p.m.

Leave City Hall for Williams' Bridge and intermediate places, 10 45 a.m.; 2 30 p.m.

Leave Williams' Bridge for City Hall, at 8 50 and 11 50 a.m.; 1, 3 45 and 4 05 p.m. 1y49

**PHILADELPHIA, WILMINGTON & BALTIMORE RAILROAD.—1847.****Summer Arrangement.**

Philadelphia for Baltimore...8 a.m. and 10 p.m.  
Baltimore for Philadelphia...9 a.m. and 8 p.m.  
Connecting with Mail Lines North, South & West.

On Sundays, only the 10 P. M. Lines run.

The Boat Lines, via Newcastle & Frenchtown R.R. Leave Philadelphia at 3½ p.m. } No line on Sun-Leave Baltimore at 3 p.m. } day.

Accommodation Trains between Philadelphia & Wilmington.—Philadelphia to Wilmington, 8 a.m., mail, 12½ p.m., 4 p.m., 7 p.m., 10 p.m. mail. Wilmington to Philadelphia, 7 a.m., 1 p.m., mail, 4½ p.m., 7 p.m., 12½ a.m., night mail.

J. R. TRIMBLE,

Engineer and General Superintendent.

**GEORGIA RAILROAD. FROM AUGUSTA to ATLANTA—171 MILES.**

AND WESTERN AND ATLANTIC RAILROAD FROM ATLANTA to OOTHCALOGA, 80 MILES.

This Road in connection with the South Carolina Railroad and Western and Atlantic Railroad now forms a continuous line, 388 miles in length, from Charleston to Oothcaloga on the Oostenaule River, in Cass Co., Georgia.

**RATES OF FREIGHT.**

	Between Augusta and Oothcaloga and Dalton. 350 miles.	Between Charleston, Oothcaloga and Dalton. 388 miles.
1st class. Boxes of Hats, Bonnets, and Furniture, per cubic foot.....	\$0 16	\$0 26
2d class. Boxes and Bales of Dry Goods, Sadlery, Glass, Paints, Drugs and Confectionary, per 100 lbs.	1 00	1 50
3d class. Sugar, Coffee, Liquor, Bagging, Rope, Cotton Yarns, Tobacco, Leather, Hides, Copper, Tin, Feathers, Sheet Iron, Hollow Ware, Castings, Crockery, etc.	0 60	0 85
4th class. Flour, Rice, Bacon, Pork, Beef, Fish, Lard, Tallow, Beeswax, Bar Iron, Ginseng, Mill Gearing, Pig Iron, and Grindstones, etc.....	0 45	0 70
Cotton, per 100 lbs.....	0 45	0 65
Molasses, per hogshead.....	8 50	13 50
" " barrel.....	2 00	3 25
Salt per bushel.....	0 17	
Salt per Liverpool sack.....		95
Ploughs, Corn Shellers, Cultivators, Straw Cutters, Wheelbarrows... 0 75		1 37

German or other emigrants, in lots of 20 or more, will be carried over the above roads at 3 cents per mile.

Goods consigned to S. C. Railroad Co. will be forwarded free of commissions. Freight may be paid at Augusta, Atlanta, or Oothcaloga.

J. EDGAR THOMSON,

Ch. Eng. and Gen. Agent.

Augusta, Sept. 2d, 1846.

44 1y

**THE WESTERN AND ATLANTIC Railroad.**—This Road is now in operation to Oothcaloga, a distance of 80 miles, and connects daily (Sundays excepted) with the Georgia Railroad.

From Kingston, on this road, there is a tri-weekly line of stages, which leave on the arrival of the cars on Tuesday, Thursday and Saturday, for Warrenton, Huntsville, Decatur and Tusculumbia, Alabama, and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga for Chattanooga, Jasper, Murfreesborough, Knoxville and Nashville, Tennessee.

This is the most expeditious route from the east to any of these places.

CHAS. F. M. GARNETT,

Chief Engineer.

Atlanta, Georgia, April 16th, 1846.

1y1

**CENTRAL AND MACON AND WESTERN**  
ern Railroads, Ga.—These Roads with the  
Western and Atlantic Railroad  
of the State of Georgia, form a  
continuous line from Savannah to Oothcaloga, Ga.,  
of 371 miles, viz:

Savannah to Macon—Central Railroad ..... 190  
Macon to Atlanta—Macon and Western ..... 101  
Atlanta to Oothcaloga—Western and Atlantic.. 80  
Goods will be carried from Savannah to Atlanta  
and Oothcaloga, at the following rates, viz:

	To Atlanta.	To Oothcaloga.
On Weight Goods—Sugar, Coffee, Liquor, Bagging, Rope, Butter, Cheese, Tobacco, Leather, Hides, Cotton Yarns, Copper, Tin, Bar & Sheet Iron, Hollow Ware & Castings.....	\$0 50	\$0 75

## FRENCH AND BAIRD'S PATENT SPARK ARRESTER.

**TO THOSE INTERESTED IN**  
Railroads, Railroad Directors and Managers are respectfully invited to examine an improved SPARK ARRESTER, recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger and freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. M'Kee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckley & Drury, Boston, will be promptly executed. FRENCH & BAIRD.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms. Philadelphia, Pa., April 6, 1844.

\*. The letters in the figures refer to the article given in the Journal of June, 1844. ja45

**PATENT HAMMERED RAILROAD, SHIP and Boat Spikes.** The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed. JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y.  
The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merriut, New York; J. H. Whitney, do.; E. J. Etting, Philadelphia; Wm. E. Coffin & Co., Boston. ja45

**MACHINE WORKS OF ROGERS,**  
Ketchum & Grosvenor, Patterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work.  
Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR,  
445 Paterson, N. J., or 60 Wall street, N. York. 1y

**PATENT RAILROAD, SHIP AND BOAT Spikes.** The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal Iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

\*. Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand. ja45

**SPRING STEEL FOR LOCOMOTIVES,**  
Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1 1/2 to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of.

The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,

**LITTLE MIAMI RAILROAD.—OPEN**  
TO SPRINGFIELD—Distance 84 miles—  
connecting at Xenia and Springfield with Messrs. Neil, Moore, & Co's. daily daylight lines of stages going east and north, to Columbus, Zanesville, Wheeling, Cleveland, and Sandusky City. via Urbana, Bellefontaine, Henton, and the Mad river and Lake Erie railroad, or Columbus, Delaware, and the Mansfield and Sandusky City railroad—forming, by these connections, the cheapest and most expeditious route to Buffalo, Niagara Falls, Rochester, Albany, New York, and Boston.

On and after Thursday, August 13, 1846, until further notice, a Passenger train will run as follows:  
Leave Cincinnati daily at 9 A. M., for Millford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Old Town, Yellow Springs, and Springfield.

Returning, will leave Springfield at 4 hours 35 minutes A. M. A line of Hacks runs in connection with the Cars, between Deerfield and Lebanon.

Fare—From Cincinnati to Lebanon....\$1 00  
" " " Xenia..... 1 50  
" " " Springfield.. 2 00  
" " " Columbus... 4 00  
" " " Sandusky city 8 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company, on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at of a passage for every \$500 in value over that amount.

The 14 P. M. train from Cincinnati, and the 9 40 P. M. train from Xenia, will be discontinued on and after Monday, the 10th instant.

A freight train will run daily.  
4741 W. H. CLEMENT, Supt.

**BALTIMORE AND OHIO RAILROAD.**  
MAIN STEM. The Train carrying the Great Western Mail leaves Baltimore

more every morning at 7½ and 10 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburgh and Hancock, connecting daily each way with—the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Pittsburgh. Time of arrival at both Cumberland and Baltimore 54 P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pittsburgh \$10, and time about 32 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$12. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

#### WASHINGTON BRANCH.

Daily trains at 9 A. M. and 5 P. M. and 13 at night from Baltimore and at 6 A. M. and 54 P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. s13y1

**MANUFACTURE OF PATENT WIRE**  
Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by  
JOHN A. ROEBLING, Civil Engineer,  
Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition. 2v191y

**CENTRAL RAILROAD—FROM SAVANNAH** to Macon. Distance 190 miles.

This Road is open for the transportation of Passengers and Freight. Rates of Passage, \$8 00. Freight—On weight goods generally... 50 cts. per hundred. On measurement goods..... 13 cts. per cubic ft. On brls. wet (except molasses and oil).....\$1 50 per barrel. On brls. dry (except lime)... 80 cts. per barrel. On iron in pigs or bars, castings for mills, and unboxed machinery..... 40 cts. per hundred. On hhds. and pipes of liquor, not over 190 gallons.....\$5 00 per hhd. On molasses and oil.....\$6 00 per hhd. Goods addressed to F. WINTER, Agent, forwarded free of commission. THOMAS PURSE, y40 Gen'l. Supt. Transportation.

**NEW YORK & HARLEM RAILROAD CO.—Winter Arrangement.**

On and after Monday, November 23, 1846, the cars will run as follows:

Leave 27th street for 49th street, Deaf and Dumb Institute, Yorkville, Harlem Morrisiana, and Williams' Bridge, at 7 o'clock a.m. From City Hall for above named places, 2 p.m. [freight train], 2 30 p.m. 5 p.m. to Morrisiana only.

Leave City Hall for Harlem, Morrisiana, Fordham and Williams' Bridge, at 7 45 a.m., and 10 45 a.m.; 1 15 p.m., 2 p.m. [freight train], 2 30 p.m. and 3 45 p.m.

Leave City Hall for Hunt's Bridge, Bronx, Tuckahoe, Hart's Corners White Plains, Davis' Brook, Unionville and Pleasantville, [Pleasantville 4 miles from Sing Sing], 7 45 and 10 45 a.m.; 1 15 p.m., 2 p.m. [freight train], and 3 45 p.m.

#### RETURNING.

Leave Pleasantville, at 6, 10, [freight train], and 11 a.m.; 1 30, and 4 p.m.

Leave White Plains, at 8 12, 10 30, [freight train] and 11 20 a.m.; 1 50, and 4 20 p.m.

Leave Tuckahoe, 8 35, 10 55, [freight train], and 11 35 a.m.; 2 05, and 4 35 p.m.

Leave Williams' Bridge at 7 45, 8 50 and 11 50 a.m.; 2 40, 4, and 4 50 p.m.

Leave Morrisiana 8 and 9 05 a.m.; 12 05, 2 35, 4 30, 5 05 and 6 p.m.

Leave Yorkville, at 8 12 a.m.; 4 35 and 6 15 p.m.

#### SUNDAY ARRANGEMENTS.

Leave City Hall for Pleasantville and intermediate places, at 7 45 a.m.; 1 15 and 3 p.m.

Leave Pleasantville for City Hall, at 8 a.m.; 11, and 3 15 p.m.

Leave City Hall for Williams' Bridge and intermediate places, 10 45 a.m.; 2 30 p.m.

Leave Williams' Bridge for City Hall, at 8 50 and 11 50 a.m.; 1, 3 45 and 4 05 p.m. 1y49

**PHILADELPHIA, WILMINGTON & BALTIMORE RAILROAD.—1847.**

#### Summer Arrangement.

Philadelphia for Baltimore... 8 a.m. and 10 p.m.  
Baltimore for Philadelphia... 9 a.m. and 8 p.m.  
Connecting with Mail Lines North, South & West.

On Sundays, only the 10 P. M. Lines run.  
The Boat Lines, via Newcastle & Frenchtown R.R. Leave Philadelphia at 3½ p.m. No line on Sun. Leave Baltimore at 3 p.m. day.

Accommodation Trains between Philadelphia & Wilmington.—Philadelphia to Wilmington, 8 a.m., mail, 12½ p.m., 4 p.m., 7 p.m., 10 p.m. mail. Wilmington to Philadelphia, 7 a.m., 1 p.m., 4½ p.m., 7 p.m., 12½ a.m., night mail.

J. R. TRIMBLE,

Engineer and General Superintendent.

**GEORGIA RAILROAD.—FROM AUGUSTA TO ATLANTA—171 MILES.**  
AND WESTERN AND ATLANTIC RAILROAD FROM ATLANTA TO OOTHALOGA, 80 MILES.

This Road in connection with the South Carolina Railroad and Western and Atlantic Railroad now forms a continuous line, 388 miles in length, from Charleston to Oothcaloga on the Oostaula River, in Cass Co., Georgia.

#### RATES OF FREIGHT.

	Between Augusta and Oothcaloga and Dalton.	Between Charleston, Oothcaloga and Dalton.
	250 miles.	388 miles.
1st class. Boxes of Hats, Bonnets, and Furniture, per cubic foot.....	\$0 16	\$0 26
2d class. Boxes and Bales of Dry Goods, Sadlery, Glass, Paints, Drugs and Confectionary, per 100 lbs.	1 00	1 50
3d class. Sugar, Coffee, Liquor, Bagging, Rope, Cotton Yarns, Tobacco, Leather, Hides, Copper, Tin, Feathers, Sheet Iron, Hollow Ware, Castings, Crockery, etc.	0 60	0 85
4th class. Flour, Rice, Bacon, Pork, Beef, Fish, Lard, Tallow, Beeswax, Bar Iron, Ginseng, Mill Gearing, Pig Iron, and Grindstones, etc.....	0 45	0 70
Cotton, per 100 lbs.....	0 45	0 65
Molasses, per hogshead.	8 50	13 50
" " barrel....	2 00	3 25
Salt per bushel.....	0 17	
Salt per Liverpool sack.		95
Ploughs, Corn Shellers, Cultivators, Straw Cutters, Wheelbarrows... 0 75	1 37	

German or other emigrants, in lots of 20 or more, will be carried over the above roads at 2 cents per mile.

Goods consigned to S. C. Railroad Co. will be forwarded free of commissions. Freight may be paid at Augusta, Atlanta, or Oothcaloga.

J. EDGAR THOMSON,  
Ch. Eng. and Gen. Agent.

Augusta, Sept. 2d, 1846.

**THE WESTERN AND ATLANTIC**  
Railroad.—This Road is now in operation to Oothcaloga, a distance of 80 miles, and connects daily (Sundays excepted) with the Georgia Railroad.

From Kingston, on this road, there is a tri-weekly line of stages, which leave on the arrival of the cars on Tuesday, Thursday and Saturday, for Warren-ton, Huntsville, Decatur and Tusculumbia, Alabama, and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga for Chattanooga, Jasper, Murfreesborough, Knoxville and Nashville, Tennessee.

This is the most expeditious route from the east to any of these places.

CHAS. F. M. GARNETT,  
Chief Engineer.

Atlanta, Georgia, April 16th, 1846.

**T**HE NEWCASTLE MANUFACTURING Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention. ANDREW C. GRAY, a45 President of the Newcastle Manuf. Co.

**R**AILROAD IRON AND LOCOMOTIVE Tyres imported to order and constantly on hand by A. & G. RALSTON, 4 South Front St., Philadelphia. Mar. 20th

**V**ALUABLE PROPERTY ON THE MILL Dam For Sale. A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 68,497 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x33 ft, with lathes, work benches, Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, furnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45½ feet two stories high, with a shed part 45½x20 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 200 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to HENRY ANDREWS, 48 State st., or to CURTIS, LEAVENS & CO., 106 State st., Boston, or to A. & G. RALSTON & Co., Philadelphia. ja45

**T**O RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.

PASCAL IRON WORKS.

**WELDED WROUGHT IRON TUBES**

From 4 inches to 4 in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 3500 lbs. per square inch, with Stop Cocks, T, L, and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by MORRIS, TASKER & MORRIS, Warehouse S. E. Corner of Third & Walnut Streets, PHILADELPHIA.

**T**O LOCOMOTIVE AND MARINE ENGINE Boiler Builders. Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by MORRIS TASKER & MORRIS, Warehouse S. E. corner 3d and Walnut Sts., Philadelphia. 11f

**P**ATENT INDESTRUCTIBLE WATER Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.

This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York. 28tf

J. BALL & CO.

**Cincinnati and St. Louis Railroad.**

The following highly interesting article, is communicated to the *Cincinnati Gazette*, by a correspondent, who is evidently well acquainted with the interests of the West. Although his views upon some points may not be in unison with those entertained by some others, yet we give place to the article, because it contains many facts of general interest. The writer says:

It is known to the readers of your paper that important movements have been had, at many places interested, within the last few months, towards effecting a connection by railroad, between Cincinnati and St. Louis. Until the unexpected refusal of the right of way through Illinois by her Legislature, no serious obstacle was anticipated to the immediate execution of this enterprise, which, from its projecting, enlisted the co-operation of so many enterprising men of both cities and along its contemplated route, that there seemed no reason to doubt its speedy achievement. But the interest of St. Louis and the State of Illinois in the immediate commencement of this work being thus cut off, it becomes a question whether sufficient remain to carry out a part of the original intention. This claims the more consideration now, because a convention, called to decide on the steps to be taken, will convene in a short time at Indianapolis, where matters will be submitted and determined, that must greatly affect the growth and prosperity of Cincinnati, for a series of years, if not for all time to come. This will be my excuse for attempting to direct the attention of the capitalists and business men of that city to this project, which though a subject of deep interest to a portion of Indiana, is one of paramount importance to Cincinnati.

Upwards of twenty years ago, the States of New York and Pennsylvania commenced a contest for the western trade, respectively under the guidance of De Witt Clinton and Dr. Lehman, and directed their efforts to this end towards effecting a communication by canals with the western waters. For several years after it began, no other States seemed disposed to enter the lists with them to compete for this prize. So distrustful, however, were many leading men of both States, as to the benefits promised by these undertakings, that they struggled through great opposition, and that of Pennsylvania only succeeded finally, by being encumbered with expensive branches; adjuncts permitted by its friends in order to bring collateral interests to secure the accomplishment of their main purpose. Chiefly from this cause the early friends of the Pennsylvania Canal have failed to realize their exalted anticipations; while those of the New York and Erie Canal found theirs exceeded, by the immense business which has crowded this work since its completion. This partial success on the part of Pennsylvania, during the first years in which these two canals were in operation, she hoped to render complete through the advantages given her over New York by the more extended term in which her canal would be annually navigable; but before the full effect of this could be tested by experience, both States were compelled to compete for this trade, on

disadvantageous terms, with other improvements projected from quarters, which, by geographical position, were supposed to be wholly precluded from entertaining any such pretensions. Unforeseen improvements of engines, by which those weighing many tons are made to pass over railroads without injury to them, and with augmented power and speed, has demonstrated the superior adaptation of these to all the purposes of travel and transport. Yankee sagacity was soon perceived availing itself of these improvements, to attract to Boston a portion of the wealth that was pouring into New York as the result of her enterprise; and the Western railroad is constructed at great expense for this purpose, which it fulfils to the great injury of New York City, in depriving her of a large share of the Lake trade.

In the meantime Pennsylvania is driven from the study of latitude and topography, to the adoption of more efficient means to retain a trade to which she had claimed a natural right to give direction, and which she saw centreing at Baltimore over the Baltimore and Ohio Railroad, instead of at Philadelphia over her own improvements, and for this purpose has resolved upon having a speedy connection by railroad between Philadelphia and Pittsburgh. The completion of some and the advanced state of others of the thoroughfares designed to appropriate western trade allows, as well as encourages, a modified policy on the part of those engaged in them, and the Western States are beginning to profit by the rivalry existing and increasing among these various works. The foregoing development of these successive movements reveals a position of affairs from which can be better understood the motives and purposes of those who are influential in directing the efforts at present making jointly, by many eastern and western states to mark out the channels through which the commerce of particular districts of country shall flow. Eastern capital is seeking investment in Western improvements, with the view of shaping their course so as to direct their traffic to particular cities on the Atlantic; and so as to make it answer the double purpose in its transit thither, of yielding a handsome return where invested, and augmenting the revenues of other and more important thoroughfares. It is to the especial influence which this state of circumstances is exerting over the commercial operations of Indiana, that I propose to invite the consideration of the citizens of Cincinnati.

Indiana is just recovering from the exhaustion, which succeeded the shock that she, in common with the country at large, sustained a few years ago in her financial affairs, and is beginning to direct her energies again towards opening outlets to market for her large surplus productions. Sectional divisions are shaping their efforts for this end in the direction which, from geographical position or other causes, offers the fairest prospect for its speedy accomplishment; and the value of the traffic already conducting on several of these incomplete works has centered capital and enterprise to them from abroad,

that have created new and important business relations. New York capital is largely employed in the business of the Wabash and Erie Canal, by which an extended belt of rich country is becoming habituated to look to that city for a market and for its foreign supplies; and the extension of that work to Evansville, provided for in the law adjusting the State debt, must greatly augment this, after making due allowance for that portion of it which will seek the southern terminus of the canal.

Again the Madison and Indianapolis railroad is creeping into the heart of the State, and while it is drawing to itself all the trade west of its extension north, that does not flow into the Wabash river or the Wabash and Erie Canal, its attractive influence is felt as far east as Rush county, from which and Hancock county, branch railroads are projected to connect with the one at present constructing from Shelbyville, in Shelby county, to form a junction with the Madison and Indianapolis railroad at Columbus. This latter road will be completed to Indianapolis the ensuing summer, when the company design to lay another track without delay, a single one being wholly inadequate to the business which, if not diverted, must be thrown upon it. A portion of the business conducted over this road at present reaches or emanates from Cincinnati, but its rapidly augmenting traffic will shortly operate a change in the present manner of conducting it, and enforce upon Madison the impolicy of sharing with Cincinnati a business which she ought to appropriate exclusively to herself.

From Indianapolis north, the unfinished portion of the Central canal will soon be taken up and extended to its junction with the Wabash and Erie canal, as originally designed. This is practicable at a small expense, some of the most expensive parts of the work being already finished. A bill was pending in our Legislature last winter, that provided for giving the northern division of this canal to a company on terms similar to those upon which the State surrendered the White Water canal, and was lost from being made a rider to the Butler bill, from which it was dismounted at too late a period of the session to permit the necessary formalities to be gone through with to secure its passage on its own legs. Unless some other enterprise shall divert the attention of those moving in this matter, our next Legislature will incorporate the Central Canal company, when it is probable the owners of the Wabash and Erie canal, whose revenues would be augmented by this tributary branch, will supply any small deficiency of means necessary to its completion, beyond what will be furnished by the counties through which it will pass.

Through the facilities which will be afforded by these three important works, the Wabash and Erie Canal, the Madison and Indianapolis Railroad, and the Northern Division of the Central Canal when in operation, the trade of a large portion of Indiana, that would under a different state of circum-

stances reach that city, must be diverted from Cincinnati, unless, by some countervailing policy, she can attract it thither. Suitable exertions made at once could probably effect this now, but if delay or indifference shall mark her course in reference to the only mode in which this is practicable, and a railroad fail to be commenced this summer to effect this object, the period is not remote when she will find, that no expenditure of capital or degree of exertion can fully retrieve the loss she must sustain, in having the trade of these large, productive, and growing regions of country directed to other points. We will lean upon the arm that will yield us the most support, and both interest and inclination at present, lead a majority of our citizens to desire to have it proffered from Cincinnati. The present posture of affairs demonstrates that her valuable trade is attracting attention abroad, and if it shall appear that she may pour her wealth into the lap of Cincinnati, upon condition her own resources create the facilities therefor, the broad and deep current that would otherwise set in that direction, will be dispersed into many streams, any one of which may equal that, to flow to that city. A tonnage estimated to be worth \$2,500,000 passed last year over the Wabash and Erie Canal from Lafayette to Toledo, no part of which probably paid her tribute, in any way; and that of the Madison and Indianapolis Railroad much short of what it might be made to do, and that to flow through the northern extension of the Wabash and Erie Canal, will pay still less.

The last six months has witnessed the transfer of a large portion of the stock of the Madison and Indianapolis Railroad to the hands of Eastern capitalists; and with the eagerness to command the stock of this road, will come the desire to share and control the business done on it. With a trade adequate to the capacity of a double track railway from Madison to the interior of the State, the capital and enterprise that will be attracted to that place will make it no contemptible rival of Cincinnati for the trade of Indiana; and to the commercial relations that will ramify thence, on a large portion of the State, may come to be added in time, a State pride that shall jointly raise us out of our present anomalous position of a state without a commercial metropolis.

The cities in the United States that have become preeminent from their wealth and prosperity, are so in the proportion in which, they have been distinguished for their public enterprise, in making themselves the focus, from which have radiated numerous artificial channels of commerce, which have placed them in connection with remote districts of country with which they have no natural associations. Remark the policy that has been pursued by the city of Boston. Instead of waiting until the urgent wants of her neighbors should compel them to create some facility of reaching a market, and of relying upon some natural advantages to co-operate with their necessities in dictating its direction, she has anticipated their tardy movements, and re-

garded neither mountain barrier, intercepting watercourse, nor remoteness of position, when the end to be achieved, was the commerce of a State. It is to be seen whether Cincinnati will profit by the lessons of thrift, taught by such enterprising cities, to the extent which her present advantages will admit. She has the power, and should have the sagacity, to turn much of the internal commerce of Indiana from the channels to which it is at present tending, in a direction to subserve her exclusive interests and on terms that would not be disregarded by any other city in the Union if made as practicable of acceptance.

Let the business men of that city give a glance to the map of Indiana, and remark the region of country along the route of the Saint Louis and Cincinnati Railroad—observe its rectangular connection with all the important inland communications through the State, at points remote from their outlets, and they cannot fail to see that these may all be made tributary to that main channel, instead of becoming its competitors. The immense amount of agricultural products that accumulate along the Wabash River, and the Wabash and Erie Canal, during periods of interrupted navigation, would seek a market over this road; and a judicious encouragement of this trade, at such times, would secure a large portion of it at others, when no obstruction to their navigation existed. The same remark will apply to the business of the Madison and Indianapolis Railroad, for the inducements presented by a more enlarged market, would attract the business of this road to Cincinnati in preference to Madison; especially if the additional encouragement were given to this trade, of low charges for transportation over the Saint Louis and Cincinnati Railway. The trade to be done on the Central Canal, running north from Indianapolis, in the absence of a direct and cheap mode of access to Cincinnati, will be divided between the Wabash and Erie Canal, and the Madison and Indianapolis Railroad.

If the trade which might be invited from all these sources, does not seem to be worth the effort, necessary on the part of Cincinnati to secure it, she must estimate it below its actual value or esteem herself incompetent to the undertaking. But the character of her citizens precludes the first inference; and a doubt of her ability to accomplish it, can only result from a failure to engage an interest, as general, in the undertaking, as the benefits waiting upon its accomplishment, must be diffused among all classes of her citizens.

All along the route of this contemplated railroad through Indiana, a determination has been evinced to carry it forward; but the impetus to this feeling was given by the preliminary movements had at either terminus of the road, when the subject was first agitated. It was understood then, as it is now, by those living at intermediate points, that Cincinnati and St. Louis had the deepest interest in the achievement of this undertaking; and every thing indicated their readiness to make that interest, and their ability, the measure of their efforts for its accom-

plishment; and hence the simultaneous movements in so many quarters, to testify a willingness to co-operate with them, for this purpose. Those directly interested in this State, in the success of this measure, will be the last to abandon it, as they were the last to take hold of it; and if the city of Cincinnati shall come up to the work prepared to act in the way her interests demand, she will be met by a corresponding determination; and this noble enterprise, fraught with immense benefits, social, intellectual, and pecuniary, to millions of human beings, will have had its origin and completion, within the compass of a few months. That this may be the result, must be the ardent desire of every one concerned, that owns the impulse of an honest devotion to Western independence, and, after the welfare of our common country, holds the peculiar interests of the West nearest his heart.

## CENTRAL INDIANA.

Indianapolis, May 7, 1847.

## ENGLISH AND IRISH RAILWAYS COMPARED.

The following comparison of cost and passengers is taken from Herapath.

The lines already completed in Ireland are the Ulster, Dublin, and Drogheda and Kingstown, and, in part, the Great Southern and Western and Midland Great Western; the following table shows the cost per mile of these, and also of a similar number in England of a corresponding character:

ENGLISH.		Cost per mile.
London and Croydon,	10	£80,400
Eastern Counties,	56	46,365
London and Brighton,	56	56,941
York and North Midland,	220	25,924
Norfolk,	220	13,150
IRISH.		
Dublin and Kingstown,	6	59,192
Dublin and Drogheda,	25	15,653
Ulster,	25	14,334
Great Southern and Western,	35	13,000
Midland Great Western,	35	10,000

Thus, then, it appears, the cost of construction in Ireland is invariably far less than in England; the average cost, in fact, of the lines now being made will be about £14,000 per mile; whereas, in England, it is about £25,000; the difference arising principally in the enormous sums here paid as compensation to landowners, and the much higher price of labor.

The next point for consideration is traffic. Now, it is well known that the revenue of a railway is derived principally from four sources, viz: the carriage of passengers, minerals, agricultural produce, and manufactured goods. The question then arises, in what degree does Ireland possess these?

*Passengers.*—The accompanying table shows the number of passengers per mile per annum on the lines already opened as compared with some of those in England:

	Number of Miles.	Number of Passengers per annum.	Number of Passengers per mile.
ENGLISH.			
London and Croydon,	10	768,021	76,803
London and Brighton,	56	788,366	14,078
Great Western,	220	1,993,068	9,014
IRISH.			
Dublin and Kingstown,	6	1,284,780	380,766
Ulster,	25	244,950	21,798
Dublin and Drogheda,	35	566,492	16,185

The above figures are taken from the official documents of 1845. In 1846, the number of passengers on the London and North Western was 1,008,000, and on the Drogheda and Ulster lines together, 1,111,422; the mileage of the former being more than double that of the two latter! Thus then, so far from there being as many have supposed, a lack of passengers, it appears that the number who at present use the rail in Ireland, is actually greater in proportion than that in England, where, from the extension of the system, it has become almost the sole medium of transport.

#### Bridges for Railroads--Whipple's Treatise.

We lately published a communication, from the pen of an able engineer, in relation to a pamphlet of 46 pages, by Mr. S. Whipple, of Utica, N. York. We then intimated that we should again refer to the subject. Having given it a hasty perusal, we find it well worthy of the commendations of our correspondent, "E. F. J."—and, by way of illustration, we give a few pages of the work, referring more particularly to *Iron Bridges*.

The first part of the work is descriptive of different spans and plans of construction, illustrated by diagrams, showing the effect of different plans of bracing—which makes the work practically useful to every man who has any interest in the construction, use, or durability of bridges; we therefore, with great pleasure, recommend the work, and its promised sequel, to the attention of engineers, bridge-builders and railroad companies. Without knowing positively, we presume it may be had of the author, S. WHIPPLE, C. E., and *Mathematical Instrument Maker*, Utica, N. Y.

The Title-page of the work is as follows, viz:—  
*An Essay on Bridge Building: containing Analyses and Comparisons of the Principal plans in Use, with Investigations as to the Best Plans and Proportions, and the Relative Merits of Wood and Iron, for Bridges. By S. Whipple, C. E., Mathematical and Philosophical Instrument Maker, Utica, N. Y., 1847.*

On page 38 and section 33d, he says:—

"Having decided upon the most suitable forms and proportions for bridge trusses, I will say a few words in regard to the material best adapted to the purposes of bridge building. We have seen that the materials in a bridge truss, are principally subjected to two kinds of action, that of tension and of thrust. The lateral action should always be avoided in the main parts of the truss. It is obvious then, that those materials best calculated to resist these kinds of force respectively, should, when practicable, without the sacrifice of economy, be employed in the situations where those forces are respectively exerted.

For instance, when the diagonals act by tension, the top rib, (or the arch, in case of the arched truss,) and the verticals, should be composed of the material best adapted to sustain a crushing force, while the lower rib or stringer, and the diagonals, should be of the best material for supporting tension.

Wood and iron, as before remarked, are the only materials that have been employed in bridge building, (I refer only to the superstructures,) to an extent worthy of notice, and

it seems reasonable to conclude, that on these we must place our dependence.

Cast iron will resist a greater crushing force than any other substance, whose cost will admit of its being used as a building material. Steel has a greater power of resistance, but its cost precludes its use as a material for building. Wrought iron resists nearly equally with cast iron, but its cost is twice as great, which gives the cast iron entirely the advantage. On the other hand, wrought iron resists a tensile force nearly 4 times as well as cast iron, and 12 or 15 times as well as wood, bulk for bulk.

Not only are these the strongest materials, but they are also the most durable. In fact, with proper precautions, they may be regarded as imperishable.

It would seem, then, that wrought iron for tension, and cast iron for thrust, were the best materials that could be employed for building bridges. But wood, though greatly inferior in strength and durability, is much cheaper and lighter, so that making up with quantity for its want of strength, and by frequent renewals for its want of durability, it has hitherto been almost universally used in this country for bridge building, and in the scarcity of means, and the unsettled state of things in a new country, where improvements are necessarily, to a great extent, of a temporary character, this is undoubtedly the most economical material for the purpose.

But it is believed that the state of things has now assumed that degree of settled permanency in many parts of this country, and available means have accumulated to that extent which renders it consistent with true economy to give a character of greater permanence to our improvements, and in the erection of important works, to have more reference to durability, even at the cost of a greater present outlay; and in view of the subject it seems highly probable that one of the channels in which this tendency of things will develop itself, will be in the extensive employment of iron in the construction of important bridges. With this impression, I proceed to some general comparisons as to the relative cost and economy of wood and iron as materials for bridges;

XXXIV. Cast iron resists a crushing force some 20 times as much as wood, consequently it will only require one-twentieth as much of the former to resist a given force, provided it can be put into a form in which its liability to flexure and yielding laterally, is not greater than that of wood. This can be accomplished, in part, by giving the iron a hollow form, so as to make the diameter of the pieces approximate to an equality with 20 times the same amount of wood, which must generally be used in a simple rectangular or cylindrical form.

Assuming, then, that a cubic foot of cast iron, will do the same work as 15 cubic feet of wood, (after making allowance for the necessary smaller diameter of the iron) we can institute a comparison which would seem, upon the surface, to show the relative economy of the two materials.

A cubic foot of cast iron, manufactured

for the work, will cost about \$13. 15 cubic feet of wood in a bridge will cost, say \$6.—Whence it appears that the cast iron is more than twice as expensive, in the first outlay, for sustaining a crushing force, as wood.

Again, a cubic foot of wrought iron in the work, say 450 lbs., at 7½ cts.—\$34.

Wood is about one-fifteenth as strong as iron. But about one-half of its fibres must be separated, in order that the other half may be so connected in the construction as to be available to their full strength by tension.—Hence it will take some 30 feet to equal one of iron; for which, say it will cost \$12;—showing a difference of a little less than three to one; the average for both kinds of iron, reckoning equal quantities of each, being about 26 to 1.

To offset against this, we have the superior durability of the iron, which, as before observed, may be regarded as per-durable, whereas wood requires frequent renewals, at a cost each time equal to the first outlay. Now the first cost of iron is sufficient to provide for the first cost of the wood, and nearly two renewals. Besides this, money, though an inanimate substance, is nevertheless, in these usurious times, made to be exceedingly prolific; inasmuch, that with good husbandry, it is found to double itself once in 10 or 12 years, according to the hard face of the lender, and the hard fortune of the borrower.

Assuming 5 per cent. per annum as the net income of money invested, the term of time in which the 100 dollars saved in the wooden structure, will require to produce one dollar for renewal, will show the time that wood ought to last, to be equal to iron in economy. 100 dollars at compound interest, will yield at 5 per cent. one dollar in less than ten years.

Therefore, if an imperishable iron structure cost 26 times as much as one of wood, and the latter last but ten years, and money will net 5 per cent. compound interest, the two materials are nearly on a par as to economy.

Now experience has shown that wooden bridges, unprotected by roofing and siding, seldom last with safety, over eight years, or thereabouts; and the more there be expended to increase the durability, the less surplus capital will be left towards renewals. Hence the iron would seem to have the advantage.

XXXV. But the above comparison is too superficial and general to be entitled to a great deal of confidence, except, perhaps, as regards the sustaining of a given weight by a simple post, or suspending it by a bar or rod of iron or wood. In the complicated assemblage of pieces, forming the superstructure of a bridge, there are numerous other facts and considerations which materially vary the results. 1st, there is a difficulty in connecting pieces of timber in such a manner that every part may be proportioned to the strength required of it to the same extent as can be done with iron. 2d, it is frequently necessary to use considerable quantities of iron in bolts and fastenings, for putting together a structure of wood requiring great stability. 3d, wood soon loses a portion of its strength by partial decay, and

consequently requires additional strength in the beginning, that it may be safe for a time after decay has commenced.

Hence, but little can be predicted upon the simple general comparisons of wood and iron as to strength and cost, relative to the comparative economy of the two materials for bridge building.

It is only by comparing the results of actual experience, or, where this has not been had, by comparing the results of detailed estimates, upon well matured plans, founded on well established principles, that a satisfactory conclusion can be arrived at.

With regard to wooden bridges, much experience has been had, and the reasonable presumption is, that a good degree of economy has been attained in their construction. But the idea of building iron bridges in this country is of recent date, and but little has been experimentally proved in relation to their cost and qualities.

XXXVI. This much, however, my own experience has demonstrated. Having received Letters Patent for an "Iron Trussed Bridge" upon the general plan of the arched truss shown in fig. 8, and constructed two bridges thereon, over the enlarged Erie canal, (72 and 80 feet span) one of which has been in use six years, it may be regarded as a demonstrated fact, that bridges may be sustained by iron trusses. Also, that the cost, for the above class of bridges, is only about 25 per cent. more than the same class of bridges of wood, as heretofore built, under the most favorable circumstances, on the Erie canal. That the iron portion, constituting some  $\frac{1}{3}$  of the whole as regards expense, in the iron bridge, gives fair promise of enduring for ages, while the wooden structure can only be relied on to last 8 or 10 years.

Upon these facts experimentally established I found the following comparison:

A common road bridge of 72 feet span (the usual length of the enlarged Erie canal) will cost, with iron trusses,  
7000 lbs. of cast iron, 3 cts., . . . \$210  
6000 wrought do., manufactured for the work, at 7 cts., . . . 420  
Timber, labor and painting, . . . 230  
Superintendence and profit, . . . 80

Whole first cost, . . . 940  
\$175 will renew the perishable part once in 9 years, to produce which, at 5 per cent., will require a capital of . . . 320

Total for a perpetual maintenance, . . 1260  
With wooden trusses fastened with iron, timber, labor, paint and profit, . . . 550  
2000 lbs. of iron fastenings, . . . 150

Whole first cost, . . . 700  
(Some have cost \$1000 or \$1200, and taken 3 to 4000 lbs. of iron.)  
To renew \$550 worth of perishable material, once in 9 years, at 5 per cent., compound interest, will require, . . 1000

Total for perpetual maintenance, . . \$1700  
Showing a clear ultimate saving of \$440, in favor of the iron structure.

The reason of the apparent difference between this result and that arrived at (Art. 34) from the general comparison of the cost, etc., of wood and iron is, that the bridges here referred to, have been constructed with a very large amount of iron fastenings, and with large quantities of casing and painting for protection and appearance. Were the comparison confined strictly to the expense of timber work in the sustaining parts of the trusses, the result would be found not to differ so essentially from that of the general comparison.

The above estimate of \$700 for the first cost of a 72 feet wooden bridge, though considerably below the average cost of canal bridges of that description, is nevertheless believed to be greatly above the minimum for which bridges may be built, dispensing with parts which are not essential to strength. It is probable that bridges may be built for \$500, as about the minimum, of equal strength and convenience, and nearly the same durability as those hitherto built upon the Erie canal enlargement, at a cost of 800 to 1000 dollars. Upon this supposition, which may be regarded as an extreme case in favor of wood, the comparison will stand thus:

First cost of wooden structure, . . . \$500  
Capital invested at 5 per ct. to produce \$500 once in 9 years for renewal, . . 909

Total for perpetual maintenance, . . 1409  
The same for iron structure as above, 1260

Balance in favor of the iron bridge, . . 149

Finally, since theoretical calculation and general comparison show a *probable* advantage, for a long term of time and experience, as far as it has gone, shows a *decided* advantage in favor of iron, it would seem very unwise to discard the latter, without at least a fair trial of its merits. If in the first essays at iron bridge building, the iron bridge had competed so successfully with wooden bridges, improved by the experience of ages, may not the most satisfactory results be anticipated from an equal degree of experience in the construction and use of iron bridges?

XXXVII. Presuming the affirmative to be the only rational answer to the above question, I have arranged the details of plans for carrying into practice the preceding principles and suggestions in the construction of railroad bridges of iron.

I have also made careful detailed estimates of the expense of bridges of different dimensions and in different circumstances, some of the more general results of which I will here state.

In proportioning the parts of a railroad bridge, I have assumed that it may be exposed to a load of 2000 lbs. per foot run, for the whole or any part of its length, in addition to its own weight, and in case of tension, have allowed one square inch cross section of wrought iron for every 10,000 lbs. of the maximum strain produced upon every part by such weights, acting by dead pressure. In case of thrust, or crushing force, I have allowed one square inch cross section of cast

iron for every 12,000 lbs., acting on pieces, (mostly in the form of hollow cylinders,) of a length equal to 18 diameters, and a greater amount of material, where the ratio of the length to the diameter is greater; always having regard to practicability, as well as theoretical proportions, in adjusting the dimensions of the parts.

My estimates made upon these bases have fully satisfied me, that a bridge of 100 feet span, with the track sustained upon the top, will cost about \$2000; or \$20 per foot, assuming the present prices of iron (1846) in ordinary circumstances. If the track pass near the bottom of the trusses, the expense will be increased two or three dollars per foot.

For a span of 140 feet, by a liberal detailed estimate, I make, in round numbers, a cost of \$4000. For 70 feet, I make by actual estimate, and liberal allowances for contingencies, a cost of 900 to 1000 dollars, according to circumstances.

Thus it will be seen, that actual estimate makes the cost of a single stretch of any length, very nearly as the square of the length—as should be expected from the nature of the case.

Hence, knowing the cost of a span of any given length, we readily deduce that of a span of any other length, in similar circumstance, with reliable certainty.

These estimates of cost provide for superstructures entirely of iron, except the string timbers to support the iron rail. By the substitution of wooden cross bearers, a considerable saving may sometimes be effected, without incurring serious inconveniences.

But though my investigations have forced upon me the conviction, that in general, where strong and durable bridges are required, iron should be preferred in their construction, still there is a multitude of cases where wooden structures should be preferred, especially in sections of country comparatively new, where timber is plenty and capital scarce; and where improvements must necessarily be of a more temporary character. With this view of the subject, I have given much attention to the details of wooden bridges, and with a good deal of investigation and experiment, have arranged plans which are confidently believed to possess important advantages over the plans generally in use.

I may therefore be excused the expression of a belief, that I might be able to render valuable services to those interested in the construction of important bridges, generally, and with this conviction I make the proffer of my services, wherever they may be desired, for the purpose of furnishing plans, superintending the construction of bridges, either of wood or iron, and in consultation generally in matters pertaining to this, as well as other subjects in Mechanics and Civil Engineering.

I would add that I design shortly to publish, as a sequel to what precedes, should circumstances seem to warrant it, a set of working plans for bridges of different lengths and descriptions, both of wood and iron, with details, specifications, and general remarks.

S. WHIPPLE.

Correspondents will oblige us by sending in their communications by Tuesday morning at latest.

### AMERICAN RAILROAD JOURNAL.

Published by D. K. MINOR, 105 Chestnut St., Philadelphia.

Saturday, June 5, 1847.

#### Massachusetts Annual Reports.

We give, this week, another of the Massachusetts Annual Reports.

#### Spanish Railroads.

It is remarkable that there is not in the world, such a thing as a railroad in any country where the Spanish language is spoken, with the exception of those in Cuba, which mainly owe their existence to American enterprise.

#### Stonington Railroad.

The Directors of the Stonington Railroad Company are about to make application to the City Council of Providence, for permission to bring their road into the city and to establish their depot in the Cove, so as to connect with the Boston and Worcester roads, and form an unbroken railroad communication from Boston to Stonington.

#### Telegraph Lines in the United States.

The Magnetic Telegraph Lines established in the United States, worked on Morse's plan, comprise an aggregate distance of 1575 miles. The lines under contract and in course of construction, comprise 4974 miles—making an aggregate of complete and unfinished lines of 6549 miles. By the first of January next all these lines will be in active operation.

#### Toledo.

Toledo is going ahead rapidly, and bids fair to become one of the most important ports on the Lake. Last year she sent forward 160,000 barrels of flour, and 800,000 bushels of wheat. Her enterprising citizens are making preparations for a still larger business this year. A great number of buildings are now in course of erection, and her shipping is increasing daily.

#### The New Steamer "Bay State."

An exchange paper noticing this beautiful boat, which has lately been put upon the Stonington route, says that "in her speed she has disappointed her most sanguine friends, having exceeded their expectations altogether. The Oregon admits, for the first time, that she has found a match. The boats left New York at 5 P. M., and continued together until opposite Saybrook light, when the Bay State passed her, continuing about twice her length ahead till the boats entered Fisher's Island sound, where their course changes. The Bay State was built rather for a substantial than a fast boat. Hence her speed is a matter of agreeable surprise. The Oregon did not make her passage by about 30 minutes as quick as on a former occasion, before her

immense iron braces were added to her, to strengthen her, and when she had no freight. At this time she had a large freight list.

#### New Jersey, Hudson, and Delaware Road.

The capital stock of this company, as we learn, from the Newark Advertiser, has been duly subscribed, and it is now prepared to organize under favorable auspices. A respectable association of gentlemen, comprising citizens of Sussex and Essex counties, with capitalists from New York, have subscribed for the stock, and the charter is now in hands which afford a guarantee that its liberal provisions will be employed in advancing the interests and welfare of the districts of New Jersey on the Delaware river, by judicious appropriation of capital. Pennsylvania, especially the part bordering on and in the vicinity of the Delaware, with her great mineral and agricultural resources, is deeply interested in the construction of a railroad avenue to the great commercial emporium, and New York by increasing her supplies of fuel and bread-stuffs from the country will greatly promote her own growth and the wealth of her citizens, and at the same time add to her commerce. Indeed, we can see no good reason why a railroad from the Hudson to the Delaware will not be a main link in a Westward communication extending through Pennsylvania to the great West.

#### A Curious Safety Lock.

We seldom meet with a more novel and quaint invention than that of a new bank and safe lock invented by Mr. J. Y. Savage, of New York. The lock itself is very simple, having a stout bolt attached to the inside of the door, and which is projected forward by a spring whenever the door is closed, and without the least possible communication with anything outside, no aperture nor even an indication of the situation of the lock. But a simple clock movement is attached to the door inside, and so arranged as to be adjusted to let off a spring at any required hour and minute, on the principle of the common alarm clock; and this spring, when thus liberated, withdraws the bolt inside. But neither the burglar nor the lawful proprietor can possibly obtain access to the interior till the faithful sentinel inside gives the word.

#### The Northern Railroad.

We learn from the Boston Courier, that the second annual meeting of this Company was held on Wednesday at Concord, N. H. There was a large attendance of stockholders. Charles Theodore Russell, of Boston, a director, made the report. The report states that the road is prosperous, and that the eight assessments which have been made have promptly been paid. The two freshets which occurred in February and April delayed the running of the cars in one instance four, and in the other seven days. The cost of repairs was only about \$2500. The road was in an unfinished state. After it is completed and settled down very little damage need be apprehended from freshets. Eighteen miles of the road have been opened, and in four months, from September to May, the receipts were \$13,792.97, and the expenses of running \$7,685.85. There have been some extra outlays: in ordinary circumstances, the profits would have been equal to 7 per cent. on a cost of \$20,000 a mile on that portion of the road.

The remaining portion of the road from Franklin to the River, is in rapid progress and it will be opened to Elston's, in Andover, in July next; to Grafton in August, and to Canaan in October; and the whole to and across the Connecticut River as

early as November next. At this time it is expected that the Vermont Central Railroad will be ready for use from the termination of the Northern road to Northfield, a distance of about fifty miles.

The land damages have been nearly all settled. Eight assessments have been laid, which, as already stated, have all been paid. The capital paid in and interest received amount to \$1,310,463.74, and the expenditures have been \$1,237,745.33, including a dividend of interest to stockholders on their assessments.

After the report had been accepted, a committee was appointed to collect votes for directors for the ensuing year, and the old board, consisting of George W. Nesmith, Charles Theodore Russell, Nathan Carruth, Timothy Kenrick, Francis N. Fisk, Solomon Wildes, and Barnabas B. David, were almost unanimously re-elected. The meeting then dissolved.

#### Lake Harbor Improvement Convention.

A convention of Delegates, we learn, from the Lake region, the valley of the Mississippi, and New York, will assemble at Chicago on the 5th day of July next, to adopt measures to secure the improvement of the harbors of Lake Erie, Lake Huron, and Lake Michigan. The object of the Convention is of the first importance, not only to those who reside in the vicinity of the proposed improvements, but to the citizens of New York, Boston, and all the commercial cities of the Northern seaboard. We notice that St. Louis, Cincinnati, Pittsburgh, and other principal towns, are appointing large delegations to this Convention. Buffalo chose her delegates some time ago, placing Hon. Millard Fillmore at their head. We trust that our own citizens will not be unmindful of the importance of the occasion, and the manifest propriety of being well represented thereat. It is confidently expected, by the bye, that the Hon. Daniel Webster will be present at the Convention, and lend to its proceedings the weight of his presence and influence.

#### Sparks from Locomotives.

Mr. S. T. Townsend of Albany, says the Baltimore Sun, has recently invented a new method for disposing of the sparks and smoke from Locomotive Engines, which seems likely to throw all others completely in the shade. The inconvenience arising from the sparks has been one of the most unpleasant features in railroad travel, and to get rid of them completely will be one of the greatest advances towards the perfection of that mode of conveyance. The following is a description of Mr. Townsend's apparatus: A bell muzzle pipe projects horizontally forward of the regular smoke pipe of the engine, and which after its junction with the smoke pipe, extends rear-wards. This front pipe is for the admission of cold air; and the steam from the engine is conducted separate from the smoke, nearly to the junction of the vertical with the horizontal pipes; and then coming in contact with the cold air, it becomes partially condensed, and in its progress to the rear, it keeps the inside of the pipes so moist as to quench all the sparks before they reach the end of the series. The several horizontal pipes are connected to each other by sections of elastic pipes, consisting of India-rubber cloth, peculiarly prepared to withstand the heat, and supported in its position by a helical coil of wire, terminating at each end in a metallic hoop, which is so constructed as to be instantly adjusted and fastened to either end of either of the metallic pipes. The several pipes on any number of cars, are thus connected, or occasionally detached without any trou-

ble or exertion on the part of the brakeman. Each joint or section is furnished with a small water pipe, which passes down the side of the car, for the escape of the water produced by the condensation of steam. Nearly over the safety valve, is a valve opening upward for the immediate escape of the steam when blown off from the boiler. It is proposed to elevate occasionally the rear end of the series of horizontal pipes, thus throwing the smoke upwards.

#### Railways--Waking Up.

The efforts making to complete, at an early day, a Railway from Niagara River to Detroit, through Canada, begin to excite some attention in Western New York and in New England. A recent convention on the subject has been held in Chautauque County, says the Sandusky Clarion, at which resolutions were unanimously passed, declaring:—

That it is the interest of the people on the southern shore of Lake Erie, to have a continuous Railway connection extending to the Mississippi Valley.

That New York and New England ought not to permit the granaries of the West to be sealed five months in the year, but should aid in opening such communications to the West and South as will secure their trade to the enterprise of the East and North.

That to prevent the trade of the Lakes from being diverted to the Railway through Canada, or to southern channels of commerce, a Railway along the southern shore of Lake Erie to its head, and from thence south west, should be constructed. The first great link to this improvement is a Railway from Buffalo to Erie.

The convention pledge their energies to these improvements, and send a committee to present their views to the New York Legislature now in session, and to ask for a charter to connect Buffalo with Erie, similar to the charter of Pennsylvania from the State line.

#### Railroads at the East.

The Skowhegan Clarion of last week states that a committee of its citizens are engaged in exploring a route for a railroad from that place to Augusta, by way of West Waterville, and it is expected that an Engineer will be on the ground about the 30th inst., for the purpose of examining the route.

A meeting for the organization of the Newburyport and Georgetown (Mass.) Company was held in Georgetown, on the 1st inst. A strong feeling was manifested in favor of commencing operations forthwith, and the directors were authorized to make an assessment for the purpose of securing the land and locating the road without delay, if in their opinion it should be desirable, when the subscriptions shall amount to \$75,000.

A large and spirited meeting of the stockholders of the Fitchburg and Worcester Railroad was held at Leominster on the 14th instant, and the Directors were instructed by a unanimous vote, to proceed forthwith to the location and construction of the road. It will run from Fitchburg through Leominster and Sterling villages, and connect with the Worcester and Nashua road in Sterling two miles south of the village. Its whole length will be twelve miles.

We notice that in the Maine Legislature, last week, Mr. Foster of Pembroke offered an order for the appointment of a joint select committee to inquire into the feasibility of a Railroad from Portland through Bangor, Calais and St. Stephens, to the city of St. John, or to some point on the St. John river, with power to collect statistics relative thereto, and

to invite the co-operation of citizens of the Provinces.

The Bath Tribune of Monday contains a notice calling a meeting at Lisbon, on the first day of June, at 9 o'clock, A. M., of all persons interested in having a railroad from Bath to Lewiston Falls, and still further into the interior, if thought advisable, to take such incipient measures as may be thought expedient to carry their wishes into effect. The Tribune says "a more important movement, as far as regards Bath and the places on the route, has never been made."

Our friends "down East" are evidently determined not to be outdone by competitors, in the number of their railroads, at any rate, and we are assured that the citizens in that region are in earnest in these enterprises. Happy are we to note it.

#### Railroad Intelligence.

The Commission appointed by the Legislature of New Jersey for the purpose of receiving subscriptions to the capital stock of the Summerville and Easton Road, have made arrangements to have the route immediately surveyed and the road located, and have employed engineers for that purpose. The merits of this road are equal, if not superior, to any road now made or contemplated, leading to this city. The road passes through the most thriving and rich parts of New Jersey, and terminates at the borough of Easton, one of the most growing and enterprising towns in Pennsylvania.

We learn that, at a meeting of the Board of Directors of the Baltimore and Ohio Railroad Co. the President was authorized to engage in a final conference with the authorities of the city of Wheeling, and to enter upon an examination of the late law of the Virginia Legislature, granting the right of way through that State, in order to ascertain the practicability of obtaining such present or prospective modifications of the law as would warrant the company in commencing the immediate extension of the road.

The Railroad from Detroit to Kalamazoo is now in successful operation, having improved since it came into the hands of Bostonians.—Workmen are now engaged in grading west of Kalamazoo, and the expectation is to complete the road to Lake Michigan by another year.—The point of termination at the Lake is not definitely settled. It will be either at New Buffalo or St. Joseph. It now takes about 32 hours to go from Detroit to Chicago by this route. The distance is 270 miles, viz: from Detroit to Kalamazoo, by railroad, 146; from Kalamazoo to St. Joseph, by stage, 55; and from St. Joseph to Chicago, by steamboat, 69.

The whole distance from Rochester to Niagara Falls is 81 miles, 26 miles of which road is built and in operation, and only a line of 55 miles remains unfinished, and about one half the stock for that portion of the road has been taken, say \$400,000. When the Rochester and Niagara Falls road and the Great Western (Canada) road are finished, it will complete a chain of railroad from Boston to a point in Canada, opposite Detroit, Michigan, and when the Hudson and Harlem road is finished to Albany, it will make a line from New York city to the same point, via Niagara Falls, and through Upper Canada.

The Northern (N. H.) road is to be completed to North Andover, a further distance of 15 miles by July next—making 33 miles from Concord. In the course of the year it is expected it will be complete to the Connecticut river, and on the other side of the river the Central Railroad in Vermont will be finished to Montpelier.—The receipts on the eighteen

miles already open, have exceeded \$8000 in the last 9 months, equal to 8½ per cent. per annum, after deducting expenses.

The work on the "Great Western" (Canada) road which was commenced, and suspended in consequence of the agitation of the Oregon question, is now resumed, and it is believed by persons familiar with the subject, that the amount subscribed, \$6,000,000, and partly paid in, will far exceed the amount required to finish the work. The Niagara Bridge has been chartered, and the stock to the amount of \$200,000 has been taken, which is supposed to be sufficient to complete the work.

After a long delay, which has borne hard on the patience of those immediately interested, a forward movement has been made upon the Concord and Portsmouth road, the ground has been broken, and the road may be now said to be in progress of construction.

The work upon the Rutland (Vt.) Road is going on at four points this side of Mount Holly, and the Mount Holly sections are to be commenced immediately. The sections in Brandon are progressing, and the remainder of the line will be immediately put under contract.

Within the last twelve months the people of the city of New York have subscribed about \$7,000,000 to railroad stocks. Boston about \$2,000,000; Pittsburgh about \$500,000, and Philadelphia about \$3,000,000.

The Kennebec Journal expresses a strong conviction that a railroad will be made on the Androscoggin, from Bath to Livermore or Canton,—perhaps further up.

It is now proposed to extend the Fitchburg road into Boston as soon as a convenient site may be secured and depot buildings erected.

The Harlem road has been extended and put in operation to the line of Putnam County.

#### Magnetic Telegraph Mail.

A highly important arrangement has lately been made with the Southern line of Telegraph. The Postmaster at New Orleans has announced that he will, hereafter, under instructions from the Postmaster General, make up daily a separate bag for the East, in which will be placed all communications intended to be sent to their respective destinations by Magnetic Telegraph from Fredericksburg, Va. The letters so despatched must be addressed to the operator of the Telegraph at Fredericksburg, and the postage and Telegraphic charges are to be paid in advance, at New Orleans.

The aggregate postage and Telegraphic charge for the transmission of ten words from New Orleans to Fredericksburg by mail, and thence to Baltimore by Telegraph, is 70 cents; for the same number of words to Philadelphia 85 cents; to New York \$1 10; to Boston \$1 60. For twenty words the charge will be:—to Baltimore \$1 25; Philadelphia \$1 60; New York \$2 10; Boston \$2 90. For fifty words:—to Baltimore \$2 90; Philadelphia \$3 85; New York \$5 10; Boston \$6 80. For one hundred words:—to Baltimore \$5 65; Philadelphia \$7 60; New York \$10 10; Boston \$13 30. For all words over one hundred the ratio of charge will be the same as below that number.

A number is paid for the same as a word. No charge is made for the address, signature, or date, nor for transcribing or delivering the despatch at the place of destination.

Parties wishing to keep their communications secret from the operators can do so by adopting any cypher they may agree upon with their correspondents.

## MASSACHUSETTS ANNUAL RAILROAD REPORTS.

## Return of the Taunton Branch Railroad Co., under the Act of April 16, 1846.

Capital stock.....	\$250,000
Increase of capital since last report.....	Nothing.
Capital paid in, per last report.....	250,000
Capital paid in since last report.....	Nothing.

## CHARACTERISTICS OF ROAD.

Length of road.....	11 miles.
Length of single track.....	11 miles.
Length of double track.....	None.
Length of branches owned by the company, stating whether they have a single or double track.....	None.
Weight of rail per yard in main road.....	58 lbs.
Weight of rail per yard in branch roads.....	None.
Maximum grade, with its length in main road.....	29 feet in 3000
Maximum grade, with its length in branch roads.....	None.
Total rise and fall in main road.....	123 feet.
Total rise and fall in branch roads.....	None.
Shortest radius of curvature, with length of curve in main road.....	800 feet in 1000
Shortest radius of curvature, with length of curve in branch roads.....	None.
Total degrees of curvature in main road.....	70 deg.
Total degrees of curvature in branch roads.....	None.
Total length of straight line in main road.....	11 miles.
Total length of straight lines in branches.....	None.
Aggregate length of truss bridges.....	"
Whole length of road unfinished on both sides.....	"

## DOINGS DURING THE YEAR.

Miles run by passenger trains, [on the main road with company's engines, 90,548; on Boston and Providence road, with their engines, 30,048.....]	50,596
Miles run by freight trains, [on the main road with the company's engines, 6,886; on the Boston and Providence road, with their engines, 14,976.....]	21,862

Miles run by other trains.....	1,056
Total miles run.....	73,514
Number of passengers carried in the cars.....	117,945
Number of passengers carried one mile.....	1,290,951
Number of tons of merchandize carried in the cars.....	25,607 tons 205 lbs
Number of tons of merchandize carried one mile.....	281,678 tons 258 lbs
Number of passengers carried one mile, to and from other roads.....	767,159
Number of tons carried one mile, to and from other roads.....	281,201 tons 104 lbs
Average rate of speed adopted for passenger trains, including stops.....	31 minutes per mile.
Average rate of speed adopted for freight trains, including stops.....	3 " "
Estimated weight in tons of passenger trains, including engine and tender, but not including passengers, hauled one mile.....	723,030
Estimated weight of merchandize trains, including engine and tender, but not including freight, hauled one mile.....	771,223

## EXPENDITURES FOR WORKING THE ROAD.

For repairs of road, maintenance of way, exclusive of wooden truss bridges and renewals of iron.....	\$6,440 25
For repairs of truss bridges.....	
For renewals of iron, including laying down.....	
For wages of switch-men, gate-keepers and flag-men.....	298 06
For removing ice and snow.....	36 75
For repairs of fences, gates, houses for flag-men, gate-keepers, switch-men, tool-houses.....	
Total for maintenance of way.....	6,775 06

## MOTIVE POWER.

For repairs of locomotives.....	1,325 33
For new locomotives to cover depreciation.....	861 48
For repairs of passenger cars.....	303 36
For new passenger cars to cover depreciation.....	
For repairs of merchandize cars.....	390 59
For new merchandize cars to cover depreciation.....	499 00
For repairs of gravel and other cars.....	
Total for maintenance of motive power.....	3,379 76

## MISCELLANEOUS.

For fuel and oil.....	4,880 92
For salaries, wages and incidental expenses, chargeable to passenger department.....	3,302 67
For salaries, wages and incidental expenses, chargeable to freight department.....	4,348 64
For gratuities and damages.....	95 08
For taxes and insurance.....	11 70
For ferries.....	
For repairs of station building, aqueducts, fixtures, furniture, [exclusive of amount charged to the construction thereof].....	80 63
For interest.....	
For amount paid other companies in tolls for passengers and freight carried on their roads, specifying each company, [New Bedford and Taunton, \$8,617 35; Boston and Providence, \$57,227 04.....]	65,844 39
For amount paid other companies as rent for use of their roads, specifying each company.....	
For salaries of president, treasurer, superintendent, law expenses, office expenses of the above offices, and all other expenses not included in any of the foregoing items.....	2,184 45

## INCOME DURING THE YEAR.

For Passengers:	
1. On the main road exclusively, including branch owned by company.....	1,269 56
2. To and from other roads, specifying what:	
[New Bedford and Taunton.....]	\$35,976 37
[Fall River.....]	12,815 93
[Boston and Providence.....]	31,964 46

For Freight:	
1. On main road and branches owned by company.....	23 31
2. To and from other connecting roads.....	38,916 76
U. S. mails, \$1,299 63. Interest, \$951 16. Sale of land, \$550.....	2,800 79
Total income.....	123,067 18
Net earnings after deducting expenses.....	32,163 99
[Amount charged off during the year, for depreciation of road and equipment.....]	10,941 33

## DIVIDENDS.

Surplus not divided.....	1,922 66
Surplus last year.....	25,654 52
Total surplus.....	27,577 18

ESTIMATED DEPRECIATION BEYOND RENEWALS, VIZ:	
Road and bridges.....

**How to do it.**

In a late number of the Cincinnati Gazette we find the annexed editorial, in relation to the failure of those interested to obtain a sufficient amount of subscriptions, to begin the proposed Lexington and Covington railroad. The Gazette says:

"The Licking Valley Register of May 14, states that the subscription books for the stock of this important work were open in Covington on Monday, Tuesday and Wednesday of this week, when the enormous amount of 20 shares of stock were taken, and that by one individual. The Register says: 'We have not learned whether books were opened in either Cincinnati or Newport, and we suppose it is a matter of no consequence whether they were or not, for if the same apathy prevailed in those parts that did in Covington, no stock was taken.' We are not able to enlighten our neighbor as to either Newport or Cincinnati. But we may be permitted to say to him, that he exhibits in the course of the article from which we have cut the sentence here quoted, a spirit entirely too easily discouraged. 'Say no more,' he exclaims, about a railroad from Covington to Lexington, 'for a quarter of a century!' That is the very way to make sure of having nothing done 'for a quarter of a century.' But it is not the way in which we Cincinnatians got our railroad, and the canals and turnpikes that now daily bring to this city the large surplus products of some of the richest valleys in the world. When we made our first failures in these great enterprises, we kept on saying, and at length got to doing—and now look at the results! Had we acted in the spirit of our friend of the Register, and as he would lead his readers to act, we should have found Cincinnati at the end of a 'quarter of a century,' something as Covington now is. But we saw the potency of words as preparatory to deeds, and kept on talking for that 'quarter of a century,' and were then fully prepared to go to work—and our achievements, we may without boasting say, fully vindicate the wisdom of our course.

We hope our friends of Covington and Newport will make up their minds to profit by the example of Cincinnati in this particular, and "do likewise." Our very common school children inculcate better precepts than those of the Register; for we daily hear their free glad voices ringing out the burthen of one of their favorite songs, "Try, try again!" And these words we recommend to our too easily discouraged neighbors over the river. You tried a first time some years ago, you have now tried a second time, go to work at it once like men, and "try, try again!" The Mexicans were not driven from Buena Vista by one trial, nor by two, but by many trials by individual commanders, by companies, by detachments, by regiments, by the whole army—begun, continued and renewed, till the work was done. Let the Register, and the capitalists of Covington and Newport, and the farmers and graziers along the line of the proposed road, evince something like the spirit of old "Rough and Ready," and his brave indomitable troops, and difficulties will vanish from before them as the, at one time, terri-

ble array of Mexicans vanished from before the Americans at Buena Vista.

We confess, too, much regret at the present failure of our Kentucky neighbors, but we are not much disappointed. The charter of the railroad company was not published and generally understood. The fire was not "kept up along the whole line," as it ought to have been. There was hardly a sufficient consultation, ere the opening of the books, as to "times and seasons." And especially was there not enough of the right sort of work done before the arrival of the day on which the books were to be opened. People on all such occasions are much more backward in going to the books, than they are in putting down their names when the books are carried to them. Cincinnati learnt this a good many years ago; and it is the lesson which Covington and Newport ought to have learnt before the great effort was made. But we do not despair of their road if they do.—Such a channel of transportation is necessary from the rich heart of Kentucky to her northern border at the mouth of the Licking, and it will be constructed. We have no doubt of that. But we have just as little, that hard work alone can construct it. Another trial must be made, and our neighbors must make it, and they cannot be too soon maturing their plans."

There is much truth, and good sense, in these remarks of the Gazette; and they will apply to others—both companies and individuals—as well as the parties here referred to. "Try, try again," say we.

**Railway Buffers.****Vulcanized India-Rubber Springs.**

From the London Mining Journal of April 24.

At the meeting of the Society of Arts, on the 14th inst., a paper was read "On Fuller and De Bergue's Vulcanized India-rubber Springs for Buffers, etc." The application of caoutchouc, or India-rubber, to railway purposes, has of late years occupied more or less, the attention of scientific men. Possessing, as this material does in a very high degree, the properties of flexibility and elasticity united with great tenacity and power of resistance under heavy pressure, its adaptation to various important and valuable purposes in mechanics was too obvious to have escaped notice; yet its liability to become hard and rigid when exposed to severe cold, and on the other hand soft and clammy under the influence of heat, were serious drawbacks to its extensive application; and it was not until very recently that the method of preparing it, by a patented process termed "vulcanizing," has imparted a value and importance to this simple material which is likely to lead to its much more extensive adoption in this and other departments than has hitherto been known. The process referred to (and which is now pretty generally understood) consists principally in the admixture of sulphur and some other ingredients at a high temperature (see Hancock's patent, granted in November, 1843,) by which perfect elasticity is obtained, and non-liability to be affected by any heat or cold of climate. The present invention, for which a patent was granted in October, 1845, is for the application of

the material above described for the purpose of buffer and other springs of railway carriages, according to various modes therein specified, and of which we shall now proceed to furnish a description. Instead of the steel springs, as at present, the patentees use a succession of rings or discs of India-rubber of various diameters, from 4 in. to 6 in., according to the position and strength required, and from 1 in. to 2 in. in thickness. These are placed on the buffer-rod which passes through the centre, and are separated by thin iron plates; each plate is provided with a conical collar, which serves to keep the India-rubber firmly in its place, and at the same time admits of free expansion and contraction without coming into contact with the rod.

The advantages attending the use of this material over steel are numerous and striking. In the first place, their weight being scarcely a tenth part of that of steel, they may be placed in any part of the carriage, whilst the saving of weight in a long train (amounting to several tons) will to some extent economize the locomotive powers. Next we have their extreme simplicity, and the impossibility of their being damaged or broken, even in a collision. An opportunity occurred of proving this a few weeks ago, when an engine fitted with these buffers, run off the line near Hull, the iron-work being considerably damaged and broken, but the rings altogether unhurt. Another advantage in these springs is, the greater ease with which they are acted upon at first starting, being at the outset more flexible and yielding than steel; whilst the power accumulates so rapidly under pressure as to prevent the possibility of the buffer-head being brought to a dead hard stop, the benefit of which in concussions is sufficiently obvious. Another important and distinct advantage is the facility with which their power may be regulated. It will be evident, on inspecting one of the larger rings that its power of resistance will be in proportion, first, to its diameter, (or, more strictly speaking, to its superficial area,) and next to the proportion which such diameter or area bears to its thickness; thus, a ring of any given diameter or area 3 in. thick, would be much more easily acted on and reduced to half its bulk than one of 1½ in. thick. The convex form taken by the India-rubber being in the latter case much more sudden, and requiring the exertion of nearly double the power. From this it will be at once evident that, by employing a greater number of separating plates in any given distance, you have the power of regulating these springs to the greatest exactness. The patentees state that the price of these springs (including patent right) will not exceed that of steel, but will probably be something less. Several engines and tenders have been fitted with these buffers at Wilson's Foundry, Leeds, and are now in daily successful operation on different lines. Several others are in course of erection at the manufactories of Messrs. Hick & Co., Bolton; Messrs. Sharpe & Co., Manchester; and Messrs. Lawson & Sons, Leeds. Several carriages have also been in daily use on the Great Western line for some

months past, and are very highly spoken of. Upwards of 50 are being constructed at the works of Messrs. Fox, Henderson, & Co., near Birmingham, for the Mario Antonia Railway, under the superintendence of Mr. Brunel. Experiments, as to the exemption of this material from being affected by the severest frost, have been made by the patentees during the past winter at St. Petersburg and other parts of the continent, the results of which are quite conclusive. Many of the rings have also been subjected to a pressure of 60 to 100 tons, and reduced to the thickness of 1-16th of an inch without the slightest damage, resuming their shape immediately on the pressure being removed. One of the largest was lately put under Nasmyth's steam hammer, and after receiving more than 200 blows remained equally uninjured. They are also about being applied as bearing springs, both for engines, tenders, and passenger carriages.

#### REID'S MAGNETIC WIRE.

*Patent Dated October 29, 1846. Specification enrolled April 29, 1847.*

The introduction of the electric telegraph has rendered it an object of greater importance than it ever was before, to obtain wire of great lengths, and of an equal diameter and quality throughout. When Messrs. Cooke & Wheatstone first began their operations, the ordinary weight of iron wire bundles, averaging about 192 feet in length, did not exceed 14 pounds; and it must have taken, therefore, more than 27 such bundles for each mile of telegraph, involving as many risks of failure as there were bundles; for the bundles had to be welded together at the ends, and the united wires were almost always not only thicker at the welds or joints than elsewhere, but more brittle, and very often unsound. By the invention, which is the subject of the present patent, wire can be manufactured in bundles of upwards of 100 lbs. or, indeed, of any required weight or length. It consists, so far, in simply welding together (end to end scarfwise) the rods of iron before they are drawn into wire, and then passing them through the drawing machine, whereby the whole is not only produced of one uniform diameter, but any defects in the welding are instantly detected (through the strain required by the drawing process.)

Another valuable portion of this invention consists in an improved mode of preparing the wire for being coated with zinc, to protect it from oxidation, or, as is commonly termed, being galvanized. Hitherto it has been the practice to cleanse the wire by immersing it, or otherwise subjecting it to the action of sulphuric acid, or nitric acid; and it has been often much injured in structure from the acid not acting equally on all parts of the wire alike, or from some parts being longer exposed to its action than others. Mr. Reid dispenses with the use of acid altogether, and effects the cleansing wholly by mechanical friction. By an ingenious system of machinery, which is described at length in his specification, he cleanses from 6 to 12 lines of wire at a time, and not only with immense

rapidity, but with a degree of perfection wholly unattainable by the acid process.

#### RAILWAY VILLAGES.

We find that this subject is still under consideration in England. We hope it may be carried into operation.

*"Suburban Village Association."*—The prospectus of this company is before us. Its object appears to be the improvement of the poorer classes of London in a manner purely philanthropical. The plan is simply to transfer the homes of the mass of the laboring and mechanic classes from the heart of the metropolis to suburban districts, not more than ten miles distant; railways enabling conveyance therefrom without loss of time or inconvenience. If this extensive plan be carried into effect, the nation will owe another debt of gratitude to the introduction of railways; for it is by the facilities of transit which they afford that the present scheme has been suggested; without railways, the attempt would be hopeless. The association proposes to build villages of good and neat houses, with gardens, and to let them at such rents, that the profits shall not exceed 7½ per cent.; 2½ per cent. of which goes for depreciation, and the remaining 5 per cent. as interest on the money invested. The shares are divided into small denominations, so as to allow the inhabitants, people of moderate incomes, to take them up. Being holders of shares, the inhabitants may, having paid up in cash about an equivalent for its value, get the house he holds transferred to him in lieu of his shares. This is done to enable him profitably and advantageously to invest his savings. The head of each family will possess the right of a free passage over the railway to convey him to and from the metropolis once daily.

#### ITEMS.

*St. Germain Atmospheric.*—April 14.—The working of the line was inaugurated, and opened for traffic, and continued all day with the greatest regularity.

*The Great Dutch.*—On the 13th, a trial was made on the fourth section of the Dutch railway, from the Hague, by way of Delft, to Schiedam, which proved successful, and was remarkable in many respects. Among other circumstances, it was satisfactorily proved that the auxiliary railway has perfectly answered the purpose for which it was intended. The train, consisting of nine carriages, passed along the crooked and uneven way, to which perhaps there is no parallel, at a very rapid pace, without meeting with any obstruction. This trial was considered as very important, because the bridge over the Poldevart was used for the first time. As the works which are still necessary to complete the whole line to Rotterdam are but very trifling, we may hope that the whole way, connecting the capital with the second commercial city in the kingdom, will shortly be completed.

The Emperor of Russia is about to beat Mr. Brassey or Mr. Peto as punctual and rapid contractors. His Majesty, it is said, has given orders that the works of the railway

from St. Petersburg to Moscow shall be pushed forward with the greatest activity, and that the number of workmen at present employed shall be increased by 50,000 soldiers. It is stated that this line will be entirely completed in the course of the autumn of next year, and perhaps even sooner.

There is a talk of converting into a railway the old Carlisle canal, 11½ miles long, constructed 24 years ago, at a cost of £120,000, and carrying the trade by lighters between Liverpool and Port Carlisle. The directors have had a survey made, and Mr. Errington, the engineer, reports that the conversion may be made advantageously at a cost of £50,000, and the intention appears to be to offer it on lease to some of the contiguous railways.—*Railway Chronicle*, April 24.

*Narrow Gauge Speed.*—A special train of five carriages was taken from London to Birmingham on Wednesday morning in 2 hours 30 minutes. The actual time of travelling did not exceed 2 hours, being an average speed of 56 miles per hour, the train being stopped four times on the journey, to allow other trains to be clear of the line, besides stopping at Wolverton to change engines.—The engine which started from London, is (No 157) one of Mr. Stevenson's ordinary patent engines; and 21 miles of its journey was performed in 21 minutes. The maximum speed over upwards of a mile was 75 miles per hour. The engine from Wolverton to Birmingham was also a patent engine of Mr. Stevenson's, having three cylinders, and it performed the first part of the journey 41 miles (until it was stopped by another train) in 42m.; maximum speed on this portion of the journey 64 miles per hour. Lord G. Bentinck and several gentlemen going to the Chester races, were in the train. A side wind was blowing throughout the journey. Mr. O'Connell, (the locomotive superintendent) and Mr. Winter (the superintendent of Mr. Stevenson's patent engine) were on the engine, and describe the motion at the highest velocity as being perfectly steady.

*German Railways.*—The Journal des Debates gives the following as an official return on the general traffic in 1846: "On the 31st Dec., 1846, there were 40 lines, or branch lines, open to circulation in the German states (comprising Austria) giving a total length of railway of 592 German miles, or about 2400 English. Of these lines, 9 exceed in length 90 English miles. The number of passengers conveyed by these aggregate railways, was 16,411,299. Of these, 2,266,000 on the Baden line, from Mannheim to Friburg; 2,150,000 on the lines departing from Vienna; 1,900,000 on the Bavarian and Saxon lines; 1,284,000 on the lines starting from Berlin, etc. The transport of goods amounted to 1,591,097 tons; the aggregate receipts were £2,049,233, of which £560,000 was for the transport of merchandize. In 1845, the total receipts did not exceed £1,440,000, and the number of passengers was only 13,000,000. This shows an increased traffic of about 40 per cent. in favor of 1846, which is partly to be attributed to the completion of some of the lines.—*Railway Chron.*, May 1.

**Cornish Engines.**—The number of pumping engines reported this month is 25. They have consumed 2093 tons of coal; and lifted 20,000,000 tons of water ten fathoms high. The average duty of the whole is, therefore, 54,000,000 lbs. lifted one foot high by the consumption of a bushel of coal. The boilers are leaking at Sim's engine Casa Brea. They have had condensing work at South Wheel Florances. At United Mines, Cardoso's engine has leaky boilers. The boilers at United Hills are leaky. The steam pipes are uncovered at North United mines.

—*Lean's Engine Reporter, 10th April.*

**Railroad Speed.**—The Newark Advertiser mentions that the train of cars which left Philadelphia at 4½ o'clock P.M. on Tuesday, reached that city, about 11 miles from New York, a 8 o'clock. At this rate, the whole passage from Philadelphia to New York might be made in about four hours.

**Railroad Convention.**—Delegates from Ohio, Illinois, and Indiana, assembled in the State House in this city, last Wednesday, to adopt measures in furtherance of the proposed railroad from St. Louis to Cincinnati.

Gov. Bebb, of Ohio, was selected to preside over the deliberations of the convention. On assuming the chair, he stated the object of the meeting in felicitous and appropriate terms.

The sittings of the convention were characterized by a determined desire to do all, possible to be done, to give an impetus to the final consummation of the great object in view. The detailed proceedings will be given in our next.—*Indiana State Journal.*

**Accident.**—A passenger has informed the New York Tribune, that the train over the Fall River road, from Boston to Fall River, to take the 'Bay State' for New York, came in collision, about half past six on Wednesday evening, when near Stoughton, with the way train for Boston, from Fall River, with such violence as to render the locomotives inseparable, greatly damaging the way train cars, and seriously injuring about a dozen passengers, nearly all of the way train.—Happily, no person was killed. The thro' train was obliged to send 12 miles for a locomotive.

A passenger who came by the train from Boston, informs us that in his opinion, fifty persons were more or less injured. One lady had her face shockingly mangled, while others received greater or less contusions.

The cars of the Boston train were much damaged—the platforms of two were entirely broken to pieces.

**Chesapeake and Ohio Canal.**—The Cumberland, Maryland, Civilian contains an official announcement of the completion of the negotiations by which the sum of 1,100,000 dollars has been raised to complete the canal to Cumberland. The Barings take 300,000, Boston capitalists 200,000, Virginia 300,000, the contractors 200,000, and Washington, Georgetown and Alexandria 100,000. The Civilian hopes that in their next publication, they will be enabled to announce the arrival of the contractors to commence immediate operations on the line.

## BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

## MISSING NUMBERS

OF THE RAILROAD JOURNAL.

Subscribers, who wish to obtain Missing Numbers of Back Volumes of this Journal, will do well to apply immediately.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

**NOTICE TO CONTRACTORS.**—ANDROS-COGGIN AND KENNEBEC RAILROAD. Proposals will be received at the Railroad Office, in Lewiston, until the 17th of June next, for the Grading and Masonry of the 1st Division of the Road, extending from the Atlantic and St. Lawrence Road in Danville, to Green centre, 14½ miles.

Also, separately, for the Masonry and Woodwork of the Bridges across the Great and Little Andros-coggin Rivers, the Bridges to be constructed on Towne's plan.

Plans and Profiles will be ready for examination, and the route shown, on and after the 10th of June. Satisfactory spirits will be required of bidders unknown to the officers of the company.

The 2d Division, extending to Snow's Pond in Belgrade, 25 miles, will be ready for contract about the 25th of July; and the remainder of the road to Waterville, about the 20th of September.

HOBART CLARK, Agent A. & K. R. R.  
EDWARD APPLETON, Engineer.

Railroad Office, Lewiston, May 8, 1847. 421

**CHAMPLAIN & CONNECTICUT RIVER RAILROAD.**—Notice to Contractors.—Proposals will be received until the 1st day of June, 1847, for the Grading, Masonry and Bridging of that part of the Champlain and Connecticut River Railroad, extending from the west side of the summit at Mt. Holly to the Village of Brandon, a distance of about 34 miles, and being the whole uncontracted portion of said road.

Maps, Profiles and Specifications may be found after the 20th of May next at the Office of the Engineer in Rutland, where every necessary information will be given.

The line will be divided in sections of convenient length for construction, and from those to whom the work may be awarded, satisfactory security will be required.

Proposals may be left with the undersigned, at Burlington—with George T. Hodges, Esq., at Rutland—or with William Henry, Esq., at Bellows Falls.

The work will be awarded at Rutland, as soon after the 1st of June, as the necessary examination of the bids can be made. By order of the Board,  
T. FOLLETT, President.

Office of the C. & C. R. R. Co.,  
Burlington, Vt., April 29, 1847. 320

road Depots, etc. ANDREW MENEELY.  
West Troy, May 13, 1847. 1y\*21

**PIG AND BLOOM IRON.**—THE SUBSCRIBERS are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by

A. WRIGHT & NEPHEW,  
Vine St. Wharf, Philadelphia.

121f

**RAILROAD IRON.**—THE "MONTGOMERY" Iron Company, Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to  
MURDOCK, LEAVITT & CO.,  
Agents.

1y48 77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC CEMENT.** This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper barrels, by  
JOHN W. LAWRENCE,  
149 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 331y

**A. & G. RALSTON & CO., NO. 4**  
South Front St., Philadelphia, Pa.

Have now on hand, for sale, Railroad Iron, viz: 180 tons 2½ x ½ inch Flat Punched Rails, 90 ft. long. 25 " 2½ x ½ " Flange Iron Rails. 75 " 1 x ½ " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures. 11f

## LOCOMOTIVE AND CAR AXLES.

The Subscribers are now prepared to receive orders for the well known and approved Reading Locomotive and Car Axles—drawn to any required pattern from Blooms Iron only. Address

SAML KIMBER & CO.,

Willow Street Wharf,  
Philadelphia, Pa.

41f

## RAILROAD IRON.—THE NEW JERSEY

Iron Company, Boonton, N. J., are now preparing to make Railroad Bars, and are ready to take orders or make contracts for Rails, deliverable after the first of December next. Apply to

FULLER & BROWN, Agent.

No. 139 Greenwich, corner of Cedar street.  
September 18, 1846. 1039

## RAILWAY IRON.—DAVIS, BROOKS

& Co., No. 68 Broad Street, have now in port on Ship-board, 200 Tons of the best English heavy H Rails, 60 lbs. to the lineal yard, which they offer for sale on favorable terms, also, about 6 to 700 Tons now on the way, to arrive shortly, of the same description of Rail. 461f

## TO CONTRACTORS.—KENNEBEC AND

PORTLAND RAILROAD.—Proposals will be received at this office until the 15th of May, for the Grading and Masonry of 28 miles of this road, extending from North Yarmouth to Bowdoinham, and the Branch Road from Brunswick to Bath, including the masonry for the Bridges across the Andros-coggin, New Meadows and Cathance rivers. The line of road and the plans and profiles will be ready for examination on the 10th of May; after which time any information in relation to the work can be had at this office, or of the Resident Engineers on the line of the road.

Persons unknown to the officers of the company, must accompany their bids with satisfactory evidence of their ability to execute the work.

The remainder of the line from Bowdoinham to Augusta, 21 miles, will be ready for contract about the 15th of June; of which due notice will be given.  
GEO. S. GREENE, Eng. K. & P. R. R.

ENGINEERS OFFICE, K. & P. R. R.,  
Brunswick, Me., April 6, 1847. 1m16

## THE SUBSCRIBER IS PREPARED TO

execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip.

1y10 New York.

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

**ENGLISH PATENT WIRE ROPES.—FOR THE USE OF MINES, RAILWAYS, ETC.** for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

**ALFRED L. KEMP,**

75 Broad street, New York, sole agent in the United States.

*Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.*

WIRE ROPES.				HEMPEN ROPES.				CHAINS.		STRENGTH
Wire gauge number.	Circumference of rope.	Weight per fathom.		Circumference of rope.	Weight per fathom.			Weight per fathom.	Diameter of iron.	
	INCH.	LES.	OZ.	INCH.	LES.	OZ.		LES.	INCH.	Tons.
11	4 $\frac{1}{4}$	13	5	10	24	-		50	15-16	20
13	3 $\frac{1}{4}$	8	3	8 $\frac{1}{2}$	16	-		27	11-16	13 $\frac{1}{2}$
14	3 $\frac{1}{8}$	6	11	7 $\frac{1}{2}$	12	8		17	9-16	10 $\frac{1}{2}$
15	2 $\frac{3}{4}$	5	2	6 $\frac{1}{2}$	9	4		13 $\frac{1}{2}$	1-2	7 $\frac{1}{2}$
16	2 $\frac{1}{4}$	4	3	6	8	8		10 $\frac{1}{2}$	7-16	7

*N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion.* 1y24

**THE SUBSCRIBERS, AGENTS FOR**

the sale of  
Codorus,  
Glendon,  
Spring Mill and  
Valley, } Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

**SAM'L KIMBER, & CO.,**  
59 North Wharves,

Jan. 14, 1846. [1y4] Philadelphia, Pa.

**RAILWAY IRON.—THE BEST QUALITY** of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by

**DAVIS, BROOKS & CO.,**

Jan. 2. [11f] 68 Broad St., New York.

**RAILROAD SCALES.—THE ATTEN-**

tion of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The lovers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

**ELLICOTT & ABBOTT.**

Philadelphia, Pa.

1y25

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

**W. H. CALKINS, and Others.**

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,]

**WILLIAM ROX, Sup't of Power.**

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed,] **G. A. NICOLL,**

Sup't Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,] **T. L. SMITH,**

Jersey City, November 4, 1845. **N. Jersey Railroad and Transp. Co.**

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed,] **JOHN LEACH,**

Jamaica November 12, 1845.

1y19 Sup't Motive Power.

**NICOLL'S PATENT SAFETY SWITCH**

for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee **G. A. NICOLLS,**  
Reading, Pa.

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside. **THOMAS & EDMUND GEORGE,**  
a45 N. E. cor. 12th and Market sts., Philad., Pa.

**RAILROAD IRON.—THE SUBSCRIBER'S** New Rail Iron Mill at Phoenixville, Pa., is expected to be ready to go into operation by the 1st of September, and will be capable of turning out 30 to 40 tons of finished Rails per day. They are now prepared to receive orders to that extent, deliverable after the 1st of October next, for heavy rails of any pattern now in use, equal in quality and finish to best imported.

**PIG IRON.**—They are also receiving weekly 150 to 300 tons of No. 1 Phoenix Foundry Iron, well adapted for light castings.

## DAVENPORT & BRIDGES'

### CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

### THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trelis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trelis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trelis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.		
4,224 Timbers, 11 ft. long, 3 x 6 inches =		
68,696 ft. b.m., at \$10 =		\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =		
4,403 ft. b.m., at \$13 =		57 24
13,000 Spikes = 2,350 lbs. at 4½ cts. =		101 25
Workmanship free of patent charge =		600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

**JAMES HERRON.**

Civil Engineer and Patentee.

### FRANKLIN HOUSE,

No. 105 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the Franklin House, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,

## BOSTON AND PROVIDENCE RAILROAD.

Passenger Notice. Summer Arrangement. On and after Monday, Sept. 28, 1846, the Passenger Trains will run as follows:

For New York—Night Line, via Stonington. Leaves Boston every day, but Sunday, at 5 p.m.

Accommodation Trains, leave Boston at 7½ a.m. and 3½ p.m., and Providence at 8 a.m. and 3 p.m.; Dedham trains, leave Boston at 9 a.m.; 3 p.m., 5½ p.m., and 10½ p.m. Leave Dedham at 8 a.m. and 4½ and 9 p.m.

Stoughton trains, leave Boston at 11½ a.m. and 4-10 p.m. Leave Stoughton at 8 a.m. and 2½ p.m. All baggage at the risk of the owners thereof.

31 ly W. RAYMOND LEE, Sup't.

BRANCH RAILROAD AND STAGES connecting with the Boston and Providence Railroad.

Stages connect with the Accommodation trains at the Foxboro' Station, to and from Woonsocket. At the Seekonk Station, to and from Lonsdale, R. I. via Pawtucket. At the Sharon Station, to and from Walpole, Mass. And at Dedham Village Station, to and from Medford, via Medway, Mass. At Providence, to and from Bristol, via Warren, R. I.—Taunton, New Bedford and Fall River cars run in connection with the accommodation trains.

## PHILADELPHIA AND READING RAILROAD.—Passenger Train Arrangement for 1847.

A Passenger Train will leave Philadelphia and Pottsville daily, except Sundays, at 9 o'clock A. M.

The Train from Philadelphia arrives at Reading at 12 18 M.

The Train from Pottsville arrives at Reading at 10 43 A. M.

## LEXINGTON AND OHIO RAILROAD.

Trains leave Lexington for Frankfort daily, at 5 o'clock a.m., and 2 p.m.

Trains leave Frankfort for Lexington daily, at 8 o'clock a.m. and 2 p.m. Distance, 26 miles. Fare \$1 25.

On Sunday but one train, 5 o'clock a.m. from Lexington, and 2 o'clock p.m. from Frankfort.

The winter arrangement (after 15th September to 15th March) is 6 o'clock a.m. from Lexington, and ma. 9. from Frankfort, other hours as above.

## BOSTON AND MAINE RAILROAD.

Upper Route, to Portland and the East.

SUMMER ARRANGEMENT, April 1, 1847.

PORTLAND TRAINS.

Leave Boston at 7 A.M. and 2½ P.M.

Leave Portland at 7½ A.M. and 3 P.M.

GREAT FALLS TRAIN.

Leave Boston at 5 P.M.

Leave Great Falls at 6½ A.M.

HAVERHILL TRAINS.

Leave Boston at 11½ A.M. and 6-20 P.M.

Leave Haverhill at 6½ A.M. and 4½ P.M.

READING TRAINS.

Leave Boston at 8½ A.M. and 8½ P.M.

Leave Reading at 6 A.M. and 1½ P.M.

MEDFORD BRANCH TRAINS.

Leave Boston at 7½, 11½ A.M., 2½, 5½, 7 P.M.

Leave Medford at 6½, 8 A.M., 1½, 4½, 6 P.M.

The Depot in Boston is on Haymarket Square.

Passengers are not allowed to carry Baggage above \$50 in value, and that personal, unless notice is given, and an extra amount paid, at the rate of the price of a Ticket for every \$50 additional value.

1y31 CHAS. MINOT, Super't.

## NORWICH AND WORCESTER RAILROAD.

Summer Arrangement. Change of Hours. Commencing on Wednesday, April 21, 1847.

Accommodation Trains, daily, (except Sunday.) Leave Norwich, at 6 a.m., and 4½ p.m. Leave Worcester, at 6½ a.m., and 4½ p.m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston, and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 2½ p.m. train from Boston.

New York Train via Steamboat—Leave Norwich for Boston, every morning, except Monday, on the arrival of the steamboat from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 6½ p.m., daily, except Sunday, stopping at Danielsonville and Norwich.

Freight Trains daily each way, except Sunday.—Leave Norwich at 7, and Worcester at 6 30 a. m. Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are Less when paid for Tickets than when paid in the Cars. J. W. STOWELL, Sup't

## NEW YORK AND ERIE RAILROAD LINE.

SUMMER ARRANGEMENT. For passengers, twice each way daily, (except Sunday,) leave New York from the foot of Duane St. at 7 o'clock, A. M. and at 4 o'clock, P. M. by steamboat, for Piermont, thence by cars to Ramapo, Monroe, Chester, Goshen, Middletown, Otisville, and the intermediate stations.

The return trains for New York will leave Otisville at 6 30, A. M. and 4 15, P. M.; Middletown at 7 A. M. and 4 40, P. M.; Goshen at 7 22, A. M. and 5 3, P. M.; Chester at 7 35, A. M. and 5 18, P. M.

Fare between New York and Otisville, \$1 50; way-fare in proportion.

For Milk—Leave Otisville at 5½ o'clock, morning and evening.

For Freight—The barges "Samuel Marsh and "Henry Suydam, Jr." will leave New York (from the foot of Duane St.) at 5 o'clock, P. M. daily (except Sundays.)

No freight will be received in New York after 5 o'clock, P. M.

Freight for New York will be taken by the trains leaving Otisville at 10½ o'clock, A. M.; Middletown at 11½ A. M.; Goshen at 12½, P. M.; Chester at 1 o'clock, P. M., etc., etc.

For farther particulars, apply to J. F. CLARKSON, Agent, corner of Duane and West Sts., New York, or to S. S. POST, Superintendent Transportation, Piermont.

**THE NEWCASTLE MANUFACTURING** Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention.

ANDREW C. GRAY,  
a45 President of the Newcastle Manuf. Co.

**RAILROAD IRON AND LOCOMOTIVE** Tyres imported to order and constantly on hand by

Mar. 20th

4 South Front St., Philadelphia.

**VALUABLE PROPERTY ON THE MILL Dam For Sale.** A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 68,497 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x32 ft. with lathes, work benches, Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, turnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45 ft, two stories high, with a shed part 45x20 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 300 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to HENRY ANDREWS, 48 State st., or to CURTIS, LEAVENS & CO., 106 State st., Boston, or to A. & G. RALSTON & Co., Philadelphia. ja45

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

PASCAL IRON WORKS.

**WELDED WROUGHT IRON TUBES**

From 4 inches to 4 ft in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T, L, and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by

MORRIS, TASKER & MORRIS.

Warehouse S. E. Corner of Third & Walnut Streets, PHILADELPHIA.

**TO LOCOMOTIVE AND MARINE ENGINE BOILER BUILDERS.** Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufacture: and for sale by

MORRIS TASKER & MORRIS,

Warehouse S. E. corner 3d and Walnut Sts., Philadelphia.

**PATENT INDESTRUCTIBLE WATER**

Pipes. The subscribers continue to manufacture the above PIPES, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 113 Fulton street, New York.

J. BALL & CO.

**Delaware and Hudson Canal Company.**  
**Annual Report of the Board of Managers of**  
**the Delaware and Hudson Canal Com-**  
**pany to the Stockholders, March 30, 1847.**

It is with much satisfaction that the Board again meet the Stockholders, under circumstances of continued prosperity on the part of the Company.

The usual statement of the year's business, herewith submitted, shows a net profit of \$582,767 27, being a fraction over twenty per cent. on the capital stock paid in.

It will be perceived also, by this statement, that the item of "repairs and superintendence of Canal," in 1846, exceeded the average of former years, by about \$30,000.

This was mainly owing to an extraordinary flood at the breaking up of the Delaware River, in the month of March, when the water was higher than during the great flood of 1841, which was so disastrous to the Lehigh and Schuylkill Canals, as well as our own. Against the recurrence of such an event provision has been made, by raising and strengthening our canal banks, etc., so that they are now deemed capable of resisting the action of a similar flood; and the occurrence is adverted to, principally to account for the extraordinary canal expenses chargeable to the year.

The quantity of coal brought to market during the year 1846, by this company, was 318,000 tons, which will be considerably increased during the current year.

There is an increased demand for Lackawanna coal, and the market for it is daily expanding; than which, no stronger assurance can be given of the favor in which it is held.

The canal and railroad are both in excellent condition. Thus far the spring floods have done no damage to either.

The railroad has been in operation during most of the winter, and the canal will be opened as soon as the weather will permit.

At the annual meeting of the Stockholders, in March, 1845, an increase of the capital stock of the Company was authorised. This measure was intended to provide,

1st. For an enlargement of the canal, so as to increase the capacity of boats navigating it, and thus reduce the freight which had been previously paid.

2d. For alterations, improvements, and extension of the railroad, so as to increase its capacity and economise on its former mode of working.

3d. For additional mercantile capital, for the prosecution of an enlarged business.

4th. For the redemption of the bank circulation and the stock loaned by the State to the Company, which will become due the 1st of January, 1848, and 1850.

Fifty per cent. upon the new stock having been paid in, it may be satisfactory to the Stockholders to receive some explanation of what has been done in relation to the two first objects.

In regard to the first, (the enlargement of the canal,) the Board beg leave to refer to a document herewith submitted, being an extract from a report on this subject, made to

the Board by R. F. Lord, Esq., the engineer in charge of the canal, under whose supervision this important improvement was projected and executed. It will be perceived that it has been effected thus far without interruption to the navigation of the canal, at an expense of \$253,363 80

A further expenditure of about \$12,000 will complete it.

The benefits, past and prospective, resulting to the Company from this outlay, and the merit of the engineer, to whose care the work was committed, will be fully appreciated on a perusal of the document referred to.

In this connection it may be remarked, that under the supervision of the same officer, the Board has deemed it expedient to commence, and considerable progress has already been made, in the erection of aqueducts across the Lackawaxen and Delaware rivers, near their confluence. These structures, when completed, will prevent the interruption which has frequently occurred in the navigation of the canal, in consequence of high water during spring and fall floods. It will shorten the canal about half a mile, and place a portion of it on a higher level, thereby protecting it from inundation, to which it has heretofore been exposed, and from which it has frequently sustained serious injury. In this work there has been expended the sum of \$23,932 74 and it will require upwards of a year to complete it.

During the same time, and as preparatory to, and rendered necessary by the prospective increase of the Company's business, a new insular dock has been constructing in the stream at Rondout, containing about fourteen acres. It will furnish ample space and facility for receiving and shipping coal to almost any extent, besides making a safe harbor and capacious basin for canal boats, with convenient yards for building and repairing them. There has been expended on it thus far, \$44,783 15

It is now in condition for use to a great extent, and will be completed in the course of the present year.

In relation to the second object, (alterations, improvements, and extension of the railroad,) the Board would refer in like manner to a report herewith submitted, from James Archbald, Esq., the engineer in charge of the mines and railroad. This great work is the result of his genius and forecast; and, like the enlargement of the canal, has been executed without any interruption to the regular business of the Company. It is now substantially completed, and has cost \$328,800 46

On the above objects there has, therefore, been expended the aggregate sum of

\$650,970 15

To this may be added, for the redemption of bank circulation, additional canal reservoirs, barges, canal boats, new openings in coal mines, railroad cars, and other appliances of the enlarged business for which the Company is preparing, a further expenditure (since the increase of the capital stock) of

\$171,725 93

making the total sum

\$822,696 08

In reference either to the foregoing, or to the third and fourth objects for which the capital stock was increased, it is not contemplated to make any further call on the stockholders until it becomes necessary to provide for the redemption of the State stock, \$500,000 of which will become due on the 1st of January, 1848; and the balance, \$300,000, on the 1st of January, 1850.

The Board scarcely deem it necessary to reiterate their former expressions of confidence in the continuance of prosperity to the Company; the ordeal through which it has passed ought to remove all doubt on that head. It possesses so many elements of success that it is insured by a judicious and energetic use of them. Its progress to its present position, if slow, has been sure and steady, though occasionally varied in aspect by fluctuations in the price of the great staple which is the basis of its business. The depressing influence of this cause has probably been felt in its greatest severity, and its effect was, not to blast, but simply qualify the prosperity of this Company; while kindred institutions, whose uncompromising hostility to each other produced the evil, were, and yet are, receiving no remuneration for their labor and capital. It may reasonably be presumed that ere long the lessons of experience will have their due weight—that self interest will induce the adoption of wiser counsels by the several companies, whose policy seems to be regulated by a struggle for victory and triumph, rather than profit; and, that a consequent advance in the price of coal, will soon afford to all, some return for the capital invested in mining and transferring it to market. When this event occurs, the prosperity of this Company will be greatly enhanced.

By order of the Board,  
 JOHN WURTS, President.

*Extract from a report of R. F. Lord, Esq., dated January 6th, 1847.*

The original plan upon which the canal was constructed afforded four feet depth of water, and a maximum capacity for boats carrying cargoes of 30 tons.

The lowest rate of freight for which boatmen had been obtained in the coal business, up to the year 1843, was \$1.34 per ton; and it is not probable, that for any considerable increase of business, they could have been retained at that rate; for at that they were more or less transient, and frequently abandoned their boats.

In the month of September, 1842, a plan was adopted for enlarging the canal, to be accomplished by raising the height and in-

NOTE.—The above Table does not include the Shamokin and Wilkesbarre districts.

creasing the strength of its banks and appendages, with materials taken mainly from its bed and berm side, below the surface of the usual boating head, sufficient to sustain 5 feet depth of water, improve its channel, and make it competent for boats to navigate it, carrying 40 ton cargoes, with a view of making a more desirable business for boatmen, and thereby reduce the rate of freight.

The improvement was commenced in the fall of 1842, and was prosecuted to considerable extent the ensuing winter, in order to realize in part its benefits for the year 1843, and to have it completed during the season of 1844.

The depth of water was gradually increased during the season of navigation, as the banks were prepared to sustain it. Its immediate effects were apparent, from the boats which were adapted to the former head of 4 feet, being able to carry an increased cargo, in proportion to the additional depth of water. The best class of these boats had their sides raised in order to improve the offered advantages; and new boats were built on an enlarged plan, to correspond with the improved canal.

At the close of the year 1844, a review of the improvement exhibited the following result:

There had been expended for enlargement of canal, in 1842, \$8,400 00  
1843, 61,228 25  
1844, 38,810 62

Making the amount up to the close of the year 1844 equal to \$108,438 87

For the business of the year 1843, the boats commenced the season laden with cargoes the same as they carried in 1842; and, although they moved with greater facility in consequence of the improvement, and were able to carry cargoes of 40 tons before the close of the season, the average cargoes of all the boats, taken for the whole season, does not clearly exhibit the advantages derived that year from the enlargement. The average cargoes for all the boats during the whole season, were 34½ tons, and the average freight on the whole business of the year was \$1.03 per ton; being a reduction of 31 cents per ton on 227,005 tons of coal, (the quantity in 1843,) and equal to the sum of \$70,557 55

For the year 1844, the old pattern boats averaged 36½ tons; those of them that had been raised, 39½ tons; and the new boats built for the enlargement, averaged 42½ tons. All the boats taken together for the whole season, averaged 40½ tons per cargo, or trip; and the average rate of freight was 97 cents per ton, being a reduction from the rate in 1842 of 37 cents per ton, on 251,005 tons of coal, (the quantity in 1844,) equal to the sum of \$92,871 85 showing the reduction of freight for 1843 and 1844, to have been \$163,429 40

Deduct the amount expended for enlargement up to close of 1844 \$108,438 87 we have an excess in favor of enlargement equal to \$54,990 53

After a review of the advantages derived from the enlargement of canal up to the close of the year 1844, it was resolved to continue

the improvement on the same plan, and increase the depth of water to 5½ feet, making the canal competent to the navigation of boats laden with 50 tons; and the requisite work has been progressing during the years 1845 and 1846, being now nearly completed.

There was expended during the year 1845, to complete the first contemplated enlargement, and to continue the improvement in view of increasing the capacity of canal up to the transit of boats laden with 50 tons, the sum of \$65,314 93

There has been expended during the year 1846, in continuation of the enlargement, including about \$26,000 in raising guard banks, etc., to afford greater protection against extraordinary floods, the sum of \$79,610 00 Making the aggregate amount for enlargement in 1845 and 1846, \$144,924 93

In the year 1845 there was an extensive drought, which deranged the navigation more or less during 53 days; and during that period, the boats were laden with light cargoes, and an advance of freight made to compensate the boatmen. In consequence of this, the average tonnage and rate of freight for this year does not exhibit so fully the advantages of the enlargement, compared with the season of 1844. The new boats built for the enlarged canal, during the time there was a full supply of water in it, averaged 45½ tons, and all the boats for the whole season averaged 42½ tons; the average rate of freight, including the premium paid for the whole season, was 97 cents per ton, being a reduction from the rate of 1842, of 37 cents per ton, on 266,072 tons of coal, (the quantity in 1845,) equal to the sum of \$98,446 64

For the year 1846, the new boats adapted to the enlargement, averaged 46½ tons, and carried cargoes of 50, 51, 53, and 54 tons in the latter part of the season. All the boats, for the whole season, averaged 46½ tons per trip, and the average rate of freight was 91½ cents per ton, being a reduction of 42½ cents per ton from the rate paid in 1842, on 318,400 tons of coal, (the quantity in 1846,) equal to the sum of \$136,116 00 showing a reduction in freight for 1845 and 1846, of \$234,562 64

Deduct the amount expended for enlargement during the years 1845 and 1846 \$144,924 93 we have in favor of enlargement for 1845 and 1846 \$59,637 71

Add the balance at the end of 1844 \$54,990 53 Balance in favor of enlargement at close of 1846 \$144,628 24

For a comparative view of the increased capacity of the canal, suppose we pass 96 boats per day, (which would be but four boats each way per hour for 24 hours,) laden 50 tons each, equal to 4,800 tons per day; and the navigation open 180 days, (it was 192 in 1846,) it would give per annum 864,000 tons.

Ninety-six boats per day, laden 30 tons, would be 2,880 per day, and for 180 days, only, 518,400 tons.

By this we have an annual increased capacity of 345,600 tons.

To understand the way in which our work is now done on this part of our road, (F to H, profile B,) we must go back to the foot of No. 7, at F, from which point we occupy for our loaded track, six miles of the first road, extending to No. 8; but instead of descending that plane, (as on the old arrangement,) our new road continues on at the same grade, viz: (forty-four feet per mile) all the way to Honesdale, thus making an uniform descent for ten miles, sufficient to enable the loaded cars to run by their own gravity the whole of this distance without stopping. (See black line marked "loaded car road," on profile B, from F to H.) For the return of the empty cars from Honesdale back to No. 7, we have

constructed another track, entirely different in its location from that used by the loaded cars, and employ stationary engines to draw up the cars to such elevations as enable them also to run by gravity from one engine to the other. (See chain and dotted line marked "empty car road," profile B, representing the empty track.)

On account of the hilly nature of the country, five engines were required for the ten miles; four of which were originally steam engines, and one a water wheel. In making locations for these engines we kept in view the economy of water instead of steam power for this kind of work, and were so fortunate as to find situations for all of them, (except the one at Honesdale,) where water could be used whenever the owners of it would sell at prices which it might be expedient for the Company to pay. Last year we accordingly made a purchase which gave us the control of water for one of these engines, (No. 5,) and changed it for a water wheel. This year we have been able to purchase land giving the control of water for the other two engines; one of which we shall change this winter, and the other the winter following, when four of the five engines will use water to do their work.

It may be proper here to state, that the work necessary for the construction of our new road was commenced in 1842, and nearly completed in 1844; we have, therefore, two years experience of the expediency of the change. This, I am happy to say, is fully equal to our most sanguine expectations.

The preceding descriptions include all the principal alterations made upon our main railroad from Carbondale to Honesdale. At this place, also, we have had to make some important additions to our original work, in order, (principally,) to enable us to deposit, during the suspension of canal navigation, the greater part of the coal brought over the railroad, amounting to from eighty to one hundred thousand tons. To this end it was requisite to provide ground to hold such quantity within reasonable extent, together with the engine power and machinery necessary to elevate, so that it can be piled with economy and despatch, and with the increased facilities called for by our enlarged business, to load boats, screen coal, and separate it into various sizes, carry off the cumin, or refuse dust, etc.

We have now a main road and machinery capable of sending to market five hundred thousand tons a year, or four hundred thousand tons more than was originally contemplated.

In view of this increased capacity of our main railroad from the mines at Carbondale to the canal, it was deemed advisable, as early as 1843, to commence an extension of it some seven miles further down the valley to the Company's coal lands in the township of Blakely, in order to procure a part of the coal sent to market from this field. This extension is now finished, and mines in progress of being opened at its termination, by which we will be able, by the first of May next, to deliver from three to four hundred

tons per day. A profile of this road marked C, is drawn upon the same sheet with the others; by reference to which it will be perceived, that it is constructed upon the same plan as that part of our main road from No. 7 to Honesdale, with two tracks, descending in contrary directions; on one of which the cars, after being loaded at the mines, (point A on profile C,) are drawn up from A to B by two stationary steam engines; from which elevation they run by gravity to Carbondale, a distance of seven miles, where they connect with the main road, near the foot of the water plane, (at I on profile C.) On the other track the empty cars are elevated at Carbondale, or from D to E, by one steam engine, and run from thence to the mines at A, (see line marked "empty car road," on profile C,) a distance of seven miles by gravity, on a descending grade of fifty feet per mile.

A slight examination of this plan of road will show the simplicity of all its arrangements and fitness for our business.

I have thus far confined my explanations to the changes, improvements and extension of railroad and engine power, the cost of which is charged to increased capital. The aggregate amount expended for these objects, and charged to capital, may be taken at three hundred and twenty-eight thousand eight hundred and ninety dollars and forty-six cents, (\$328,890 46.) Large as this expenditure may appear, the Company will be amply remunerated for it in a few years, by the increased capacity of the road and the greater economy with which it is worked.

It ought also to be kept in view, that the progress of our business has required extensive additions to both mining and transportation departments, necessarily involving a large expenditure from which we have not yet derived much benefit. This will be realized hereafter. Part of this outlay has been charged in the account of current expenses, and the remainder to an account for improvement, of which a portion is charged to each year's business, as it may be estimated to have received benefit. In conclusion I think I can safely say, that we are now in a state of good preparation for the business of the year; and that, unless some unforeseen difficulties occur, we shall accomplish all that was contemplated.

Respectfully, Yours,  
JAMES ARCHBALD.

#### Increase of Travellers leads to Diminution of Fares.

Already we have 10,000 miles of railway made, making, or sanctioned, superseding more or less the 25,000 miles of turnpike-roads which exist in England and Wales. As railways have spread, travellers have increased in number, and fares have been diminished. In 1845, the London and Birmingham conveyed more than treble the number of passengers over twice the number of miles, for less than double the amount received in 1839.

Half-year ending June	Passengers.	Miles.	Receipts.
1839,	267,144	17,391,035	£370,241.
1845,	612,904	38,758,260	447,190.

—Sidney's Speed on Railways.

This result usually follows the reduction of fares.

EXPERIMENTS ON VERY HEAVY GRADIENTS, have recently been made by Mr. D. Gooch, of the Great Western, and duly recorded in the columns of the *Morning Herald*. They took place on the portion of the Swindon and Gloucester line lying between the 98½ and 95½ mile posts. The line, for the whole of this distance is a series of 8 curves, varying from 2000 to 3600 ft radius; and the starting point, from which the experiments commence, viz. the 98½ mile post, is on a rising gradient of 1 in 105. This gradient extends to a little more than a furlong, and is succeeded by a rising gradient of 1 in 75 for about half a mile. There is then a rising gradient of 1 in 70 for nearly a quarter of a mile, followed by a rising gradient of 1 in 75 for rather more than three-quarters of a mile. We then come to a level of about a quarter of a mile. There is then a rising gradient of 1 in 70 for nearly a quarter of a mile, and next a rising gradient of 1 in 60 for nearly three-quarters of a mile. It was over these severe gradients (all of them on curves) that the power of the locomotive was tested, and, in order that the power might be really and commercially tested, the train was brought to a dead stand upon the incline of 1 in 105. The first experiment was with 50 tons exclusive of the engine and tender. It was taken by the "Great Western" engine, which was 8 ft. driving wheels, 18 in. cylinder, and 2 ft. stroke. The train left the 98½ mile post at 12 h. 47 m. 15½ s., and reached the 95½ post at 12 h. 53 m. 14 s. performing the 2½ miles in 5 m. 58½ s., or at an average speed of 27 miles an hour. The second experiment was with 60 tons with the same engine. The train started at 1 h. 56 m. 12½ s., and passed the 95½ mile post at 1 h. 32 m. 54½ s. doing the distance, therefore, in 6 m. 42½ s., or at the average rate of about 24½ miles per hour. The third experiment was with 111 tons, drawn by two locomotives—the "Dreadnought" goods engine, with 5 ft. wheels, 16 in. cylinder, and 5 ft. stroke, and by the "Great Western."

The train started at 3 hours 55 minutes 47½ s., and passed the 95½ post at 4 h. 2 m. 16½ s. The distance was therefore performed in 6 m. 29 s., or at the average rate of 25 miles per hour. The fourth experiment was with the same load of 111 tons, with the "Dreadnought" alone. The train left the starting-place at 4 h. 34 m. 57½ s., and passed the 95½ post at 4 h. 42 m. 42½ s., and doing the distance in 7 m. 45 s., or at the average rate of about 23 miles per hour. The fifth and last experiment was with 70 tons, with the "Great Western." The train started at 4 h. 26 m. 7½ s., and passed the 95½ post at 4 h. 33 m. 51½ s., being therefore 7 m. 44½ s. on the journey, and performing the distance at an average speed of about 23 miles per hour, doing, therefore, not more than the coupled goods engine had just performed with 111 tons. The moment before the "Great Western" started with the 70 tons a slight sprinkling shower came down and wetted the rails.—*Railway Chronicle*.

Correspondents will oblige us by sending in their communications by Tuesday morning at latest.

### AMERICAN RAILROAD JOURNAL.

PUBLISHED AT 105 CHESTNUT ST. PHILADELPHIA.

Saturday, June 12, 1847.

#### Delaware and Hudson Canal.

We give in this number of the Journal the Annual Report, entire, of this Company. The prosperity of this work is almost as gratifying to those—not interested in its stock—who have watched its course during the past twenty years, as it is to those of its early shareholders, who have adhered to it through "good report and evil report," until they are reaping a rich reward for their perseverance. It is deserving of a more extended notice than we can now give—but we shall probably again refer to it, and can only add that it should be read by every friend of internal improvement, and every consumer of anthracite coal in the country.

We give annexed a list of the Directors and Officers of the Company for the current year.

#### OFFICERS OF THE DELAWARE AND HUDSON CANAL COMPANY, FOR 1847.—MANAGERS.

John Wurts,	Aquila G. Stout,
Philip Hone,	Henry Young,
Wm. M. Halstead,	Jacob R. Le Roy,
Isaac L. Platt,	Irish Hawley,
Allison Post,	Wm. S. Herriman,
Silas Holmes,	Cyrus Hitchcock,

Charles N. Talbot.

John Wurts, President.

Isaac L. Platt, Vice-President.

Isaac N. Seymour, Treasurer and Secretary.

#### Tunnel.

Our Canadian friends are becoming a great people. They have secured the construction of a Railroad bridge over the Niagara river below the falls. It is now said they will make a tunnel under the St. Lawrence river at Montreal to enable the Boston Railroad to enter the city. The river at that place is 40 feet deep and one third of a mile wide. The tunnel is estimated to cost a million of dollars.

#### Singular Discovery in Mississippi.

The Louisville Journal, in a recent article says: "In the South-western part of Franklin county, Miss., there is a platform or floor of hewn stone, neatly polished, some three feet under ground. It is about one hundred and eighty feet long, and eighty feet wide. It extends due north and south, and its surface is perfectly level. The masonry is said to be equal, if not superior, to any work of modern times. The land above it is cultivated, but thirty years ago it was covered with oak and pine trees, measuring from two to three feet in diameter. It is evidently of very remote antiquity, as the Indians who reside in the neighborhood had no knowledge of its existence previous to its recent discovery. Nor is there any tradition among them from which

we may form any idea of the object of the work, or of the people who were its builders. There is also a canal, and well connected with it, but they have never been explored. A subterranean passage may be underneath. Farther explorations may throw some light upon its origin."

#### New Style of Locomotive.

The plan of Mr. NICOLLS, civil engineer of the Reading Railroad, is about to be introduced into use upon that road, which is intended to consume anthracite coal. The boiler is intended to be placed upon one set of wheels, and the engine upon another, working free and independent of it, with the connection between the engine and boiler formed by means of a copper pipe working flexibly by means of a universal joint.

It is intended to be used upon the principal of low pressure, by condensing, similar to the plan now most approved upon steamboats. We have always been of the opinion that locomotives upon this road, more particularly than upon any other, should use coal instead of wood for fuel, both as regards economy and policy. Whether Mr. Nicolls has hit upon the most judicious plan of accomplishing this object we shall be better able to judge from actual experiment. A substitute of coal for wood, we understand, would make a saving to the company of over one hundred thousand dollars a year—quite an item.

#### Rochester Flour Trade—Canal Tolls.

From the Rochester Democrat we learn that the amount of flour shipped east on the canal from the opening of navigation to the 15th of May, is as follows:

1847.....	68,992
1846.....	52,823

Increase in 1847.....16,169

It will be seen that the amount shipped in two weeks of 1847 exceeds that of four weeks in '46 by over 16,000 bbls.

The following is a statement of the tolls collected at the port of Rochester, on the Erie and Genesee Valley Canals for the first two weeks of navigation: From May 1st to May 15th, 1847.....\$25,993 92  
First two weeks in 1846.....8,288 37

Increase in 1847.....\$17,710 55

The canal opened last year on the 16th of April; this year, May 1st. The following will show the tolls collected from the opening of navigation to May 15th each year:

1847.....	\$25,993 92
1846.....	10,454 76

Increase in 1847.....\$15,544 16

It will be noticed that the tolls collected in two weeks of 1847, are more than double the amount collected in four weeks in '46.

#### Air-Line Railroad between New York and Boston.

The point on which much anxiety has been felt in connection with this subject, has been settled for the present, in regard to the Massachusetts section. Notwithstanding the Committee to whom the subject was referred, may have been somewhat influenced by the interests of the existing Railroad Corporations, the route decided on will not materially vary the distance from that of the true air-line route.

This route, which is the one petitioned for by Nathaniel Miller and others, commences at the terminus of the Walpole Railroad in Walpole, thence passing through Wreatham, Franklin, Bellingham, and a corner of Blackstone, through the village of

Waterford in the town of Blackstone, to the west side of Blackstone River, opposite the village of Blackstone, and there intersecting with the Providence and Worcester Railroad. The length of the line to be constructed on this route is 17 miles, of which 14 are a straight line. It has no curve of a less radiance than 3800 feet, and the maximum ascent is 35 feet to the mile for 3½ miles. The principal objection, if any, to this route, is the inconvenience of subjecting the immense business of this road in any measure to the control of another company. But this may be the best route, nevertheless.

#### Grand Improvement in Iron Manufacture.

The machinery of most of the furnaces erected within the year past, is operated by water power; but by the recent introduction of certain important improvements in which steam power has a decided advantage, it is thought it will generally be adopted in preference. At Jackson's furnace, at Westport, Mass., steam power is employed, and the advantages thereof together with those of the improvements referred to, are such that the cost of the manufacture has been reduced nearly 40 per cent. A flue is placed within the furnace chimney or funnel, and extends nearly to the top; and by this flue the hot gas and smoke is returned and brought down to the end of the steam-boiler furnace, where it passes through a perforated iron plate when it comes in contact with atmospheric air, whereby a brilliant combustion is produced, and this flame passing under the boilers, generates as much steam as is required for all the business of the furnace, and drives a mill besides. Another improvement has been projected by a gentleman connected with the iron business in Massachusetts, by which this hot gas from the furnace is first passed through a series of chambers, enclosing ovens filled with wood, which is thereby perfectly charred; the gas being afterwards passed to the engine furnace, mixed with air and ignited, produces an intense flame. The wood is thus converted to charcoal without expense, and the pyroligenous acid produced in the process, is ordinarily sufficient to pay the entire first cost of the wood; thus furnishing charcoal for the iron furnace free of expense.

#### Important Improvement in Steam-Engines.

Mr. C. C. C. Smith, an ingenious mechanic of Boston, is engaged in perfecting an arrangement of the parts of the common steam engine, in such a manner as to nearly supersede the use of the pumps, prevent entirely the incrustation of the boiler, and save much of the ordinary requisite attention of the engineer. The principle, says the Scientific American, may be thus explained:

The boiler is at first supplied with the required quantity of water, and when the steam is raised, and the engine started, the exhaust steam is immediately condensed in a cold receiver, and the water produced by the condensation, is, by the operation of the machinery, forced back into the boiler, without allowing a particle of the steam to escape, thus securing an uniform quantity of water in the boiler. And whenever it is requisite to blow off steam, the escaping steam is also condensed and immediately returned to the boiler. We are aware that the celebrated Perkins attempted the use of this principle in part, with his extra-high pressure engines, but did not succeed; nor did he attempt the condensation of the steam from the safety valve. And it is certain that this plan has never been successfully applied to low pressure engines, though we see no good reason why it may not be done. We would encour-

rage Mr. S. to persevere till he has brought this important desideratum to practical perfection.

#### The Telegraph System.

We have received the following communication in reply to our remarks in the Journal of 10th of April on this subject. It has been delayed, in consequence of our absence, longer than it should have been, as we desire always to give our readers both sides of every question of importance on which we hold views different from those interested. We aim to give the truth—and are always open to conviction.

We shall, in our next, give a synopsis of the arguments against the bill alluded to by Mr. Kendall. WASHINGTON, MAY 26th, 1847.

D. K. Minor, Esq., Editor of the American Railroad Journal.

Sir—A friend has put into my hands a number of your paper dated the 10th ult., containing an editorial article, headed "The Telegraph System," which I deem it my duty to notice.

You say "It is generally understood that Mr. Kendall refuses to sell the patent on any route or to allow its use on any terms, other than on the condition of the patentees having, as a consideration for the use of the patent, one half the stock or property in any line on which it may be used."

You have been greatly misinformed on this point. A line from Philadelphia, through Reading to Pottsville, has been absolutely sold and paid for, and several others in Pennsylvania have been bargained away in the same manner. And I am happy to inform you and your readers, that *every line in the Union, not already bargained away, is for sale in like manner without any reservation of stock or property therein whatsoever.*

You are equally in error where you say, that "a further objection to the whole system is, that imperfect as it is, it has become a monopoly of the closest kind, and threatens to be one of monstrous character. Some two or three, or a small number of individuals, of whom Mr. Kendall is the copartner and agent, owning under this system, *one half the stock, have the absolute control of all the telegraphs in the United States, with the power of taxing, to any extent, the transmission of intelligence, however imperfectly the duty may be performed.*"

I have already shown you that on some of the lines the persons alluded to neither exercise nor possess any power whatsoever.

Nor do they possess a controlling power over any of the organized companies in which they are stockholders. Under their Articles of Association, no stockholder can give more than one sixth of the aggregate vote. This restriction reduces the power of the Patentees far below one-half, even where they hold half the stock, and give the other stockholders a preponderance equal to sixteen against four.

That preponderance in the company which has honored me with its Presidency, has been largely augmented by the sale of one fourth of the Patentees' stock, and their power now, in the vote of that company, is but as seven to twenty, and no more.

The same restriction exists and a portion of the Patentees' stock has in like manner been sold in the New York, Albany, and Buffalo Company.

In the original contract for the line west from Philadelphia only *one-fourth* of the stock, and of course but a fourth of the power was reserved to the owners of the Patent.

It is there, that in some contracts upon which companies have not yet been organized, there is no restriction upon the vote of the stockholders. But is it supposed by any man, that the object of the Pa-

tentees or myself in this enterprise is power? No; it is money. We sell all the small lines absolutely, and sell half of the great lines for means to build the other half, except so much of the stock as we choose to retain as a permanent investment. We care nothing for the power, and cheerfully yield the management to the other stockholders, and shall do so as long as abuses do not require our interposition.

You may not be aware, that when I became Prof. Morse's Agent in the Spring of 1845, his Patent could have been sold for little or nothing. I thought the plan to make it "most valuable to himself" was to retain an interest in the great lines until experience should have demonstrated their value which was wholly unknown but believed by me to be very great. Perhaps I was mistaken; and if you can now inform me of a better plan by which Morse's great invention can be made more "valuable to himself or to the public," I will be largely your debtor.

Are you right when you say, "No one ever heard before of an inventor refusing to sell his patent and requiring as a consideration for its use, not only half the profits to accrue from it during the existence of the Patent, but half the property on which it was to be applied?" I think the cases are numerous in which Patentees without money have gone into partnership with capitalists, the one putting in the patent right and the other money, and owning in common the machines built and the articles manufactured. Of this right to form such partnerships, there can be no doubt. Whether they will do so or sell their patents for a sum of money, is a matter for their own consideration. On one point I concur with you: It is in the suggestion that the police of the Railroad Companies may be advantageously employed in looking after the Telegraph lines, and I do not doubt that the mutual interests of the parties concerned will in due time lead to that result. But in my opinion, no greater evil could befall the Telegraph than that it should be placed, especially on the great lines of correspondence, under the control of the Railroad Companies. Such a system would produce four Telegraph Companies between New York and Washington instead of one; three on the great Southern line through Virginia, and some dozen or twenty between Washington and New Orleans instead of one. When you reflect, that each Railroad Company is local in its position and views; that each is always striving to make the most money it can, without regard to the interests of the rest; and that it is found impracticable for them to unite upon a through ticket for travel, you will be at no loss to decide whether the control of the Railroad Companies, each along its own line, or of independent companies with more comprehensive objects and views, will render the Telegraph "most valuable to its owners or to the public."

There are men in the country, some of them connected with railroads, who looked quietly on while the Telegraph was struggling into existence, without giving it a dollar of money or a word of encouragement; but, now that the principal difficulties have been overcome by the means, labor, and perseverance of others, they are very willing to "reap where others have sown." But they are not content to come into the enterprise on the same terms as those who have gone before them. They claim higher privileges and better terms, as if they merited special favors and dispensations at the hands of Professor Morse and his associates; and if these are refused, they find fault with every thing; talk and act as if some wrong had been done them, and exhibit a peculiar antipathy to "Mr. Amos Kendall."

We had recently a notable instance of this sort in Virginia. The Richmond, Fredericksburg, and Potomac Railroad Company desired to build Morse's Telegraph, but were unwilling to do it on Morse's terms—terms which could be and have been obtained from other parties. An attempt was then made to obtain an Act of the Virginia Legislature granting to the Railroad Companies the exclusive right to construct a Telegraph on the great Southern mail route, and compelling Professor Morse and the other owners of his patent to sell to those companies and nobody else, or, in case of refusal, depriving them of the power to use it on that route altogether! That I may not be suspected of misrepresentation, I must give you some quotations from the bill actually drawn by the Agents of the Railroad Company, and actually passed through one branch of the General Assembly.

The first and second sections gave to the three Railroad Companies, (one of them extending about 23 miles) power to establish a Telegraph and to "make such charges for the use of said Telegraph lines, or for the transmission of intelligence or messages of any description by the same, as may seem to them most advisable." The third section among other things provided that "the said Railroad Companies shall be bound to pay for the use of Morse's Patent such sum as may be, in the opinion of the Board of Public Works, a fair and reasonable compensation for the use of said patent on their respective roads."

The sixth section was in the following words: viz.

"Be it further enacted, That any other person or persons than the said companies, or those who may act by their authority, who may construct, or attempt to construct or maintain a line of Telegraph in the state, east of the Blue Ridge, similar to those herein authorized, without the authority of the General Assembly, along any of the public roads of this state, shall be deemed guilty of a misdemeanor, and be punished as for a misdemeanor at common law."

As the State of Virginia owns two-fifths of the stock in the Railroad Companies, it was reasonable to conclude that the General Assembly would never allow a competing line to be established; and if the bill had become a law, Professor Morse would have had no alternative but to part with his patent right on that line, altogether upon the valuation of an interested party, or relinquish all attempts to make it valuable to himself. And from the mouth of him who was working the power of the General Assembly to force Professor Morse to part with his property that it might be made a legal monopoly in the hands of the Railroad Companies which he controls, I heard, before a Committee of the Senate, the identical arguments against monopoly as well as other suggestions which I find in your article.

I enclose for your perusal an epitome of the arguments which satisfied the General Assembly of Virginia that they ought not to make the Telegraph a monopoly in the hands of the Railroad Companies, and also a printed bill, containing all the material provisions of the Act which they finally passed. Knowing that you can have no motive to lead your readers astray, and must desire, as well to give them correct information as to guard them against error. I shall be happy at all convenient times to answer any inquiries from you relative to the present Telegraph system and the manner in which it is conducted.

With high consideration,

Your Obedt. Servant,

AMOS KENDALL.

## MASSACHUSETTS ANNUAL RAILROAD REPORTS.

## Return of the Western Railroad Company, under the Act of April 16, 1846.

Capital stock .....	\$3,000,000 00
Increase of capital since last report .....	400,000 00
Capital paid in, per last report .....	3,000,000 00
Capital paid in since last report .....	400,000 00
Total amount of capital stock paid in .....	3,400,000 00
Funded debt, per last report .....	4,999,555 56
Funded debt paid since last report .....	
Funded debt, increase of, since last report .....	
Total present amount of funded debt .....	4,999,555 56
Floating debt, per last report .....	
Floating debt paid since last report .....	
Floating debt, increase of, since last report .....	
Total present amount of floating debt .....	
Total present amount of funded and floating debt ..	4,999,555 56
Average rate of interest per annum on do. ....	5 1-5 per cent.
COST OF ROAD AND EQUIPMENT.	
For graduation and masonry, per last report .....	3,146,496 36
For graduation and masonry, paid during the year ..	7,545 50
Total amount expended for graduation and masonry ..	3,154,039 86
For bridges, per last report .....	163,736 23
For bridges, paid during the past year .....	
Total amount expended for bridges .....	163,736 23
For superstructure, including iron, per last report ..	1,031,686 08
For superstructure, including iron, paid during the ..	
the past year .....	22,347 38

For engineering and other expenses, paid during the ..	
past year .....	
Total amount expended for engineering and other ..	
expenses .....	665,850 61
Total cost of road and equipment .....	6,409,590 97
[Cost of Albany and West Stockbridge railroad— ..	
built and leased by Western railroad] .....	1,776,197 45

## CHARACTERISTICS OF ROAD.

Length of road .....	117,801 miles.
Length of single track .....	111,350 miles.
Length of double track .....	6,454 miles.
Length of branches owned by the company, stating ..	
whether they have a single or double track .....	
Weight of rail per yard in main road .....	56 1/2 lbs.
Weight of rail per yard in branch roads .....	
Maximum grade, with its length in main road .....	83 ft. per mile, 1-5 miles.
Maximum grade, with its length in branch roads ..	
Total rise and fall in main road .....	2087 ft.
Total rise and fall in branch roads .....	
Shortest radius of curvature, with length of curve in ..	
main road .....	682 ft.; 490 ft. in length.
Shortest radius of curvature, with length of curve in ..	
branch roads .....	
Total degrees of curvature in main road .....	6370 ft.
Total degrees of curvature in branch roads .....	
Total length of straight line in main road .....	62,935 miles.
Total length of straight lines in branches .....	
Aggregate length of truss bridges .....	6092 1/2 feet.
Whole length of road unfinished on both sides .....	

## DOINGS DURING THE YEAR.

Miles run by passenger trains .....	215,369
Miles run by freight trains .....	313,259
Miles run by other trains .....	45,328
Total miles run .....	573,956
Number of passengers carried in the cars .....	265,664
Number of passengers carried one mile .....	14,273,181
Number of tons of merchandize carried in the cars ..	166,394

Number of tons of merchandize carried one mile .....	15,748,223
Number of passengers carried one mile, to and from ..	
other roads .....	7,042,846
Number of tons carried one mile, to and from other ..	
roads .....	11,275,654
Average rate of speed adopted for passenger trains, ..	
including stops .....	25 miles per hour, Bos- ton and Springfield. 20 miles per hour, Al- bany and Springfield.

Average rate of speed adopted for freight trains, in-  
cluding stops .....

Estimated weight in tons of passenger trains, includ-  
ing engine and tender, but not including passen-  
gers, hauled one mile .....

Estimated weight of merchandize trains, including  
engine and tender, but not including freight, haul-  
ed one mile .....

## EXPENDITURES FOR WORKING THE ROAD.

[For repairs of Albany and West Stockbridge road] ..	\$11,601 46
For repairs of road, maintenance of way, exclusive ..	
of wooden truss bridges and renewals of iron .....	32,495 54
For repairs of truss bridges .....	11,674 13
For renewals of iron, including laying down .....	24,622 12
For wages of switch-men, gate-keepers and flag- ..	
men .....	
For removing ice and snow .....	2,973 94
For repairs of fences, gates, houses for flag-men, ..	
gate-keepers, switch-men, tool-houses .....	
Total for maintenance of way .....	83,367 19

## MOTIVE POWERS.

For repairs of locomotives .....	41,909 25
For new locomotives to cover depreciation .....	9,700 00
For repairs of passenger cars .....	3,391 31
For new passenger cars to cover depreciation .....	4,750 00
For repairs of merchandize cars .....	21,899 75
For new merchandize cars to cover depreciation .....	10,500 00
For repairs of gravel and other cars .....	
Total for maintenance of motive power .....	89,453 31

## MISCELLANEOUS.

For fuel and oil .....	95,006 01
For salaries, wages and incidental expenses, charge- ..	
able to passenger department .....	22,508 18
For salaries, wages and incidental expenses, charge- ..	
able to freight department .....	63,458 63
For gratuities and damages .....	7,514 91
For taxes and insurance .....	1,260 49
For ferries .....	2,785 17
For repairs of station building, aqueducts, fixtures, ..	
furniture .....	16,195 09
For interest .....	244,731 57
For amount paid other companies in tolls for pas- ..	
sengers and freight carried on their roads, specify- ..	
ing each company .....	
For amount paid other companies as rent for use of ..	
their roads, specifying each company .....	
For salaries of president, treasurer, superintendent, ..	
law expenses, office expenses of the above offices, ..	
and all other expenses not included in any of the ..	
foregoing items .....	31,130 89

## INCOME DURING THE YEAR [11 months.]

For Passengers:	389,861 42
1. On the main road exclusively, including branch ..	
owned by company .....	217,064 22
2. To and from other roads, specifying what:	172,797 20
For Freight:	459,365 18
1. On main road and branches owned by company ..	
2. To and from other connecting roads:	302,406 50
U. S. mails, Rents .....	29,191 29
Total income .....	878,417 89
Net earnings after deducting expenses .....	221,005 52

## DIVIDENDS.

Surplus not divided .....	204,000 00
Surplus last year .....	17,006 52
Total surplus .....	87,005 47
ESTIMATED DEPRECIATION BEYOND RENEWALS, VIZ:	
Road and bridges .....	104,011 99
Buildings .....	
Engines and cars .....	

Addison Gilmore, Edmund Dwight, John Howard, Josiah Stickney, Stephen Fairbanks, James Russell, Robert Campbell, Jona. Chapman, Abram. H. Howland—Directors.

## REPORT OF COMMISSIONERS

## On the Sinking Fund of the Western Railroad.

The Commissioners of the Sinking Fund of the Western Railroad, in compliance with the direction of the Statute, submit the following report of their proceedings during the past year, of the amount and condition of the said fund, and of the income of the same:

The amount of this fund on the 31st day of December, 1845, as per commissioners' report, \$290,610 61  
 And there has been received from the Western Railroad Corporation, Dec. 31, 1846, 1 per cent. on loan of \$1,000,000, 40,000 00  
 Received for dividends and interest, including \$1,234 25 gain on sale of 75 shares Boston and Providence Railroad stock, 18,631 81

\$349,242 42

The investments are as follows:

Notes and mortgages, - \$203,700 09  
 Notes and collateral, - 900 00

\$204,600 00

\$39,000 U. States 5 per cent. stock, cost \$29,860 00

\$7000 U. States 6 per cent. stock, cost 7,000 00

100 shares Providence Railroad stock, 9,500 00

123 shares Boston and Worcester Railroad stock, 14,096 96

44 shares Boston and Lowell Railroad stock, 26,298 75

200 shares Old Colony Railroad stock, 30,864 50

107,650 21

Cash on hand, 37,022 21

\$349,242 42

If there be added to this \$97 00 interest due and unpaid, also interest accrued but not due, it will amount, on the 1st day of January, 1847, to \$354,618 12, which would be the whole amount of this fund on that day.

In submitting this report, the commissioners would ask leave to call the attention of the Legislature to the following facts:

The debt which this fund is intended to meet falls due between April 1, 1868, and April 1, 1871; the amount in the fund, at the average of those dates, at compound interest, will exceed \$3,000,000, of which one-third, or over \$1,000,000, will be in mortgages.

The existence of so large a fund may render it difficult to obtain suitable investments, and it would be almost impossible to convert, at one time, such an amount of mortgages into money.

The commissioners would, therefore, suggest the expediency of allowing a greater latitude in the kinds of investments, and, particularly, of authorizing the commissioners to purchase and return to the Commonwealth any of the bonds issued by the State, in aid of the Western Railroad, that they may be cancelled, and the liabilities of the Commonwealth thus far diminished.

JOS. BARRETT, }  
 JOSIAH QUINCY, JR., } Commissioners.

#### The Discoveries of 1846.

We apprehend, and there can be no doubt that the year 1846 will be memorable to the end of time, for the remarkable extensions, or new applications, of human knowledge, which will come before future historians as rendering illustrious its narrow limits. Most evident is it that we are now living in the days predicted by the Hebrew prophet; when "many shall run to and fro: and knowledge shall be increased."

1. Foremost among these may be placed the use of ether, inhaled for the facilitating operations. Like all other appliances of this kind, it meets with failures and even with evil results in a few cases. But for one fatal result and five failures we have five hundred instances of vast benefit, in many of which, beyond all doubt, lives have been saved. Without describing it as infallible, or in all cases safe, or to be relied on there can be no

doubt that this discovery has conferred vast benefits on mankind.

2. The substitution of a new explosive material,—the gun-cotton,—in place of gunpowder, is another remarkable event. The extent of its utility is not yet ascertained. Whether it will be largely adopted in warfare is still a point on which no decided opinion has been formed. But of its great utility in all blasting and mining operations, not the slightest doubt can exist. It is both cheaper and more powerful than gunpowder, and the absence of smoke gives it a decisive advantage. There can remain no question, that in all works of this description, the new agent will rapidly supersede the old one.

3. The third discovery of 1846 is perhaps even of greater importance than either of the former. We allude to the lately patented process for smelting copper by means of electricity. The effect of this change will be quite prodigious. It produces, in less than two days what the old process required three weeks to effect. And the saving of fuel is so vast, that in Swansea alone the smelters estimate their annual saving in coals at no less than five hundred thousand pounds. Hence it is clear that the price of copper must be so enormously reduced as to bring it into use for a variety of purposes, from which its cost at present excludes it.

The facility and cheapness of the process, too, will enable the ore to be largely smelted on the spot. The Cornish mine proprietors are anxiously expecting the moment when they can bring the ore which lay in the mine yesterday, into a state to be sent to market to-morrow; and this at the very mouth of the mine. In Australia also, the operation of this discovery will be of the utmost importance. Ten thousand tons of copper ore were sent from Australia to England last year to be smelted at Swansea; and the result was only 1600 tons of copper. But Australia in future will smelt its own copper, by a 36-hours process; saving all this useless freight of the 8400 tons of refuse; and saving also the cost of the old expensive process. In a very few years Australia will send to market more copper than is now produced by all the rest of the world. But if our future penny-pieces are to bear any proportion to the reduced cost and value of the metal, they must be made of the size of dinner plates.

#### Vermont and Massachusetts Railroad.

After an unusually protracted session, our Legislature has closed, and prominent among its acts involving the question of public policy and justice to citizens, stands the refusal to the Vermont and Massachusetts Railroad—not of a state subscription to its stock—not an issue of its Scrip—but the simple privilege to borrow from another corporation the aid which that had received from the state to its great benefit and prosperity, but now no longer needing it, would be glad to endorse over to another for a like benefit. At the hands of a parent Commonwealth, having an interest in the prosperity of her whole family, this has been refused—and this too, after the bill in its transit by the usual course of legislation, had almost passed without opposition.

By what influence, and for what reason and purpose this change in the action of the House was produced, is a subject of general inquiry.

The Vermont and Massachusetts Railroad is an extension of the Fitchburg, across the whole breadth of Worcester North, into Franklin county, to Brattleboro', Vt., with a view to intersect the Rutland at Bellows Falls, and ultimately destined to be the trunk of an extension from some point to the Hudson River, and for its importance prospectively, second to no road in the state. Its whole line, from Fitchburg to the Connecticut, abounds in water-power to an extent unequalled by any other line of the same distance, passing through a community unsurpassed for their enterprise, thus uniting the two greatest elements for business, water-power and enterprise. Such is the Vermont and Massachusetts Railroad in its claims and importance to the Public, in which Worcester North has a great interest, and while struggling as many other roads (now the most prosperous under this aid) have done before, why has it received this blow to its prospects of immediate completion and success? For this the people of Worcester North feel aggrieved: And feel it sorely. Has it thus fallen upon us because in past years, when this policy which has triumphantly benefitted the state, was made a political question, and as the Whig anchor of the state and county? Worcester North unitedly came forward in support of it, and particularly the Western Road in her days of application and peril? She then held and gave the casting vote deciding the date of that great public work, fixing upon the Commonwealth the "mortgage," then made the party "whistle" of alarm, now so safe and productive—or has the rod been thus applied to us because, with feelings of pride for her prosperity in becoming a great centre, we have always attached ourselves to Worcester, and with the most loyal feelings have resisted from without every application to separate from her, and thus when we ask in our turn, what by our influence the state has liberally conferred on others, we are turned upon and refused? The spirit of inquiry from whose hands we have been thus treated, has actively gone forth—Why the sudden change in the action of the House, and who among us made the Somerset, by a direct vote, or dodged the question, and for the want of whose voice and efforts it was finally lost.

When the bill was first acted upon in the House, it stood upon its own merits, and before private feelings, sectional prejudices, and corporate interests were awakened, passed with hardly an opposition—this was an honest action of the House, worthy the former character of our Legislature for the broad, liberal and comprehensive views of public policy, under which she exhibits an extent of railroad all paying good interest, resting on individual enterprise, beyond any other, if not every other, state in the union of like character for its soundness and value.

Who among us indulged in these prejudices and feelings? They will commend no

one to the future suffrage of the North, whose liberal example may justly reproach them with injustice.

The "moonshine" plea of *precedent* is the only one made, and that came with an ill grace from those who had been eminently the beneficiaries of the policy—an old harp always used to alarm, but never practised in legislation. If *precedent* could be placed in claim for legislative action, why should not every band or railroad charter applied for, be at once granted?—there are certainly precedents enough!—practically, every case stands on its own merits, and the question of public good is the true test of decision. Shall the state refuse to do justice to a party for fear that under the plea of *precedent*, they may be required to do injustice, or a wrong act?

Though the Vermont and Massachusetts road may be retarded in its progress, and the public deprived of its benefits, and the corporation lose an income from the use of its whole length, yet, with one million of money paid in, and the road constructed as far as this outlay will carry it, with the business it will be able to exhibit, it will possess an irresistible inherent power to carry itself through in spite of every obstacle.

#### WORCESTER NORTH.

We copy the above article from the Worcester *Ægis*. We know from personal observation that the Vermont and Massachusetts Railroad is being constructed in a more thorough and substantial manner than any road yet built in New England, and its vast importance to all Northern Massachusetts, cannot be questioned for a moment. We know, too, some of those "from whose hands we have been thus treated." Some who have "made somersets." And at least one who, while at first he nobly and eloquently sustained the interests of this long-neglected portion of our Commonwealth, (his birth-place and early home,) was found *capable*, at the final passage of the bill, of dodging the question.—*Fitchburg Sentinel*.

#### Accidents on Railways.

The return moved for by Mr. Edward Buller, of the number and nature of accidents and injuries to life and limb which have occurred during the six months ending on the 31st of December, 1846, now printed, exhibits the following results:—

Forty lines makes a return of an aggregate of 144 accidents, involving loss of life to 81, and injuries to 154.

The line on which the larger number of accidents have occurred, are the—

	Killed.	Wounded.
Eastern Counties,	4	34
Manchester and Leeds,	10	14
Midland Counties	8	3
North-Western (London and Liverpool,)	10	14
London and Brighton, and South-Western,	4	29
Edinburgh and Glasgow,	2	4
Great Western,	3	0
North Union,	5	11
Stockton and Darlington,	4	4
Bristol and Birmingham,	2	4
Manchester and Lincolnshire,	3	2

As regards the class of accidents in which passengers are most interested, viz., collisions—the return shows 16 such cases, causing injuries to 70 persons and death to three. The return, which specifies the nature of each particular accident, likewise shows that the majority of the entire cases arise from the carelessness of the sufferers themselves; and of this class 40, mostly fatal, are from the single cause of crossing or walking on the lines in front of an advancing engine.

#### Connecticut and Passumpsic Rivers Road.

The first forty miles of this Railroad, from its lower terminus at the mouth of White River to the village of Wells River, Vt., is now under contract. The contracts for grading and masonry have been taken by sections, at prices within the engineer's estimates, by several companies, most of whom are favorably known as experienced and efficient contractors. They are Messrs. O. Keefe & Boyle, Ten Brook & Brintnal, E. Gilmore & Co., Shaler & Sammons, G. H. Wood & Co., Davis & Fisher, Shaler & Gray. We understand that the work is to be prosecuted so as to be ready for the rails June, 1848, with a view to the completion of the road to Wells River, in the fall of the same year.

From an examination of a map and profile of this road we are agreeably surprised to notice the directness of the line, and the remarkably low grades. On the forty miles contracted for, the maximum grade is about 26 4-10 feet the mile. Although this is essentially a continuation of the Northern Railroad, and forms the avenue from the upper valley of the Connecticut and northern Vermont to Boston, yet connecting as it does at the mouth of White River, with the Vermont Central Railroad and the lines of railroad down Connecticut river, it will receive a great amount of business and travel from the valley of the river below, and from the western part of Vermont.

The local business along the line of this road can hardly be overrated. Those acquainted with the country north of the mouth of White River, through the valley of the Connecticut and Passumpsic rivers, to Canada line, can state, without contradiction, that as regards the productiveness of the soil, the abundance of water-power, and the thrift and the enterprise of the population, it is not exceeded by any part of New England.

A line of villages, averaging some three or four miles apart, lie upon the immediate banks of the river, and some of them are quite important. Among others, are those of Dartmouth College, (Hanover) Norwich, Vt., nearly opposite; Lyme, Orford, Haverhill; and Bath, in New Hampshire, and Bradford, Newbury and Wells River, in Vermont.

The business of the towns lying back from the river, on either side, for a considerable distance, must fall naturally into this valley, while at Wells River it opens to a more widely extended district, the business of which cannot fail to make this road immediately productive, as soon as it is opened to that point. Its extension thence to St. Johns-

bury, in the centre of Caledonia county, may be looked upon as certain at an early day, and its ultimate completion to the Canada line, where it will connect with the Canadian road to Montreal, is looked for at no distant day. We commend the plain, unostentatious, yet well-arranged and business-like proceedings of the Directors in bringing this road into its present position, and have no doubt that it will be a successful and safe operation for the stockholders, and an important acquisition to the business of Boston. Its friends in this vicinity may promise to themselves, within two years, a trip over this road to the Mineral Springs and the great Ox-Bow, in Newbury, Vt., and an excursion thence to the White Hills, which are about twenty miles from the village of Wells River.—*Boston Courier*.

#### ITEMS.

**Railroad Convention.**—A Railroad Convention was held at Indianapolis on the 12th instant, in relation to the junction, by railroad, of St. Louis and Cincinnati. The Cincinnati Chronicle says—

We learn that at the Convention it was ascertained that the Indiana line is all chartered and the companies formed from Terre Haute to Richmond. Books will be opened on this line, and great interest is felt in the matter.

In Illinois, it is true, that the charter granting the right of way, failed, at the last Legislature, by one vote only. The Delegates from Illinois assure the friends of the road, that there is no longer any difficulty on that score. The particular opposition which occasioned it is withdrawn, and the charter will easily pass the next Legislature. Parts of the road in Illinois are already done, and with the capital of St. Louis, the aid of the counties, and other means which may be obtained, we doubt not its completion. What Cincinnati has to do, is, to have the road made through Hamilton to Richmond. It is only fifty miles—will cost half a million of dollars, and can be made with perfect ease by Cincinnati, the county of Butler, and the county of Wayne (Indiana.) The Convention resolved, that Books of Subscription should be opened for the Line, through Richmond and Hamilton, to Cincinnati. They also resolved, that Cincinnati should be looked to as the point of connection in Ohio, and that every effort should be used to arouse feeling and secure capital—to make the road to Cincinnati, and thence to the Atlantic.

**Walpole Railroad.**—The Directors of the Walpole Railroad Co. have concluded a contract with Messrs. E. Gilmore & Co., for the grading, masonry, etc., of the entire line of their road from Denham to Walpole. Arrangements are already made for commencing the work on the three upper sections.

**The Albany and Boston Railroad** is doing an unprecedented business in freighting just now. The great demand for flour for the Boston market, caused large purchases in Albany, and since Saturday morning week, from 20,000 to 25,000 barrels have been sent over the Western road to Boston. And this is the work of but six days.

**Covington and Lexington Railroad.**—A friend who feels a deep interest in this important project, informs us that the apathy manifested towards it by the citizens of Covington, grows out of "dissatisfaction with the charter. He says that it was determined by common consent not to subscribe stock until some of the obnoxious features of the law should be removed, or a new charter granted. He thinks, and he speaks from an intimate knowledge of the feelings and ability of the citizens of Covington,—that with a liberal and satisfactory charter, \$150,000 of the \$250,000 required to effect an organization of the company, would be taken in Covington and vicinity at once. The cost of the entire road is estimated at one million of dollars. He says our friends over the river fully understand their interests, are feelingly awake to them, and will be ready to move actively and effectively in this matter the moment that suitable legislative action shall have been had.

The only regret, then, is, that operations are delayed eight or ten months. Much better this, however, than that a commencement should be made under auspices any other than the most favorable.—*Cin. Gaz.*

**Illinois and Michigan Canal.**—The Trustees, at their recent meeting on the line of the Canal, procured the relinquishment by the contractors of such portions of the heavy work as could not under the present arrangement, be finished by November next, and will prosecute the construction of those portions by laborers in their own immediate employ. Six hundred laborers are wanted, to whom one dollar per day will be paid, and about one hundred stone masons at \$2 50 per day.

**The Electro-Magnetic Telegraph** now in course of construction between Fredericksburg and New Orleans will pass along the line of the South Carolina Railroad. The Charleston Mercury says—

It is decided that the section of the line from Columbia to Charleston, thence to Augusta, shall be first completed and put into operation. Wire for upwards of one hundred miles of the route is already prepared, and may be expected soon to arrive.

**Portland and Kennebec Railroad.**—We learn from the Kennebec papers that contracts for grading the Kennebec and Portland road from Portland to Bowdoinham have been given to three companies of individuals, to wit: The road from Bath to Brunswick, with the depot at Bath, to Colby & Co., of Brunswick; the road from North Yarmouth to Brunswick, to O'Neal & Co., of Massachusetts; and the road from Brunswick to Bowdoinham, including the depot at Brunswick, to Edgeton & Marsh of Maryland. These lettings have been made upon terms more favorable than had been anticipated. The number of competitors for the work was large.

The surveys of the remainder of the road to Augusta are nearly completed, and it will soon be advertised for contract. The surveyors are now at work between Gardiner and Hallowell.

## BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

## MISSING NUMBERS

OF THE RAILROAD JOURNAL.

Subscribers, who wish to obtain Missing Numbers of Back Volumes of this Journal, will do well to apply immediately.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

**NOTICE TO CONTRACTORS.**—ANDROS-COGGIN AND KENNEBEC RAILROAD. Proposals will be received at the Railroad Office, in Lewiston, until the 17th of June next, for the Grading and Masonry of the 1st Division of the Road, extending from the Atlantic and St. Lawrence Road in Danville, to Green centre, 14½ miles.

Also, separately, for the Masonry and Woodwork of the Bridges across the Great and Little Androscoggin Rivers, the Bridges to be constructed on Towne's plan.

Plans and Profiles will be ready for examination, and the route shown, on and after the 10th of June. Satisfactory surities will be required of bidders unknown to the officers of the company.

The 2d Division, extending to Snow's Pond in Belgrade, 25 miles, will be ready for contract about the 25th of July; and the remainder of the road to Waterville, about the 20th of September.

HOBERT CLARK, Agent A. & K. R. R.  
EDWARD APPLETON, Engineer.  
Railroad Office, Lewiston, May 8, 1847. 4c21

**CHAMPLAIN & CONNECTICUT RIVER RAILROAD.**—Notice to Contractors.—Proposals will be received until the 1st day of June, 1847, for the Grading, Masonry and Bridging of that part of the Champlain and Connecticut River Railroad, extending from the west side of the summit at Mt. Holly to the Village of Brandon, a distance of about 34 miles, and being the whole uncontracted portion of said road.

Maps, Profiles and Specifications may be found after the 20th of May next at the Office of the Engineer in Rutland, where every necessary information will be given.

The line will be divided in sections of convenient length for construction, and from those to whom the work may be awarded, satisfactory security will be required.

Proposals may be left with the undersigned, at Burlington—with George T. Hodges, Esq., at Rutland—or with William Henry, Esq., at Bellows Falls.

The work will be awarded at Rutland, as soon after the 1st of June, as the necessary examination of the bids can be made. By order of the Board,  
T. FOLLETT, President.

Office of the C. & C. R. R. Co.,  
Burlington, Vt., April 29, 1847. 3c90

ANDREW MENEELY.  
West Troy, May 12, 1847. 1y\*21

**PIG AND BLOOM IRON.**—THE SUBSCRIBERS are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of iron is solicited by

A. WRIGHT & NEPHEW,  
Vine St. Wharf, Philadelphia.

19c1

**RAILROAD IRON.**—THE "MONTGOMERY" Iron Company, Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to  
MURDOCK, LEAVITT & CO.,  
Agents.

1y48 77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC Cement.** This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper-barrels, by  
JOHN W. LAWRENCE,  
143 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 3c1y

**A. & G. RALSTON & CO., NO. 4**  
South Front St., Philadelphia, Pa.

Have now on hand, for sale, Railroad Iron, viz: 180 tons 2½ x 4 inch Flat Punched Rails, 90 ft. long. 25 " 2½ x 4 " Flange Iron Rails. 75 " 1 x 1 " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures. 4tf

## LOCOMOTIVE AND CAR AXLES.

The Subscribers are now prepared to receive orders for the well known and approved Reading Locomotive and Car Axles—drawn to any required pattern from Bloom Iron only. Address

SAM'L KIMBER & CO.,  
Willow Street Wharf,  
Philadelphia, Pa. 4tf

## RAILROAD IRON.—THE NEW JERSEY

Iron Company, Boonton, N. J., are now making Railroad Bars, and are prepared to execute orders for any required pattern. Apply to

FULLER & BROWN, Agents,  
No. 139 Greenwich, corner of Cedar street.  
June 1, 1847. 10c39.

## RAILWAY IRON.—DAVIS, BROOKS

& Co., No. 68 Broad Street, have now in port on Ship-board, 200 Tons of the best English heavy H Rails, 60 lbs. to the lineal yard, which they offer for sale on favorable terms, also, about 6 to 700 Tons now on the way, to arrive shortly, of the same description of Rail. 46u

## TO CONTRACTORS.—KENNEBEC AND

PORTLAND RAILROAD.—Proposals will be received at this office until the 15th of May, for the Grading and Masonry of 28 miles of this road, extending from North Yarmouth to Bowdoinham, and the Branch Road from Brunswick to Bath, including the masonry for the Bridges across the Androscoggin, New Meadows and Cuthance rivers. The line of road and the plans and profiles will be ready for examination on the 10th of May; after which time any information in relation to the work can be had at this office, or of the Resident Engineers on the line of the road.

Persons unknown to the officers of the company, must accompany their bids with satisfactory evidence of their ability to execute the work.

The remainder of the line from Bowdoinham to Augusta, 31 miles, will be ready for contract about the 15th of June; of which due notice will be given.

GEO. S. GREENE, Eng. K. & P. R. R.  
ENGINEERS OFFICE, K. & P. R. R.  
Brunswick, Me., April 6, 1847. 1m16

## THE SUBSCRIBER IS PREPARED TO

execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip.  
New York, 1y10

# RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

## ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—

for sale or imported to order by the subscriber. These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,

75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH Tons.
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.		Weight per fathom.	Diameter of iron.	
	INCH.	LB. OZ.	INCH.	LB. OZ.		LB.	INCH.	
11	4	13 5	10	21 -		50	15-16	90
13	3	8 3	8	16 -		27	11-16	13
14	3	6 11	7	12 8		17	9-16	10
15	2	5 2	6	9 4		13	1-2	7
16	2	4 3	6	8 8		10	7-16	7

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1y24

## THE SUBSCRIBERS, AGENTS FOR

the sale of  
Codorus,  
Glendon,  
Spring Mill and  
Valley, } Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

SAM'L KIMBER & CO.,

59 North Wharves,

Jan. 14, 1846. [1y4] Philadelphia, Pa.

**RAILWAY IRON.—THE BEST QUALITY** of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by

DAVIS, BROOKS & CO.,

Jan. 2. [1lf] 68 Broad St., New York.

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLICOTT & ABBOTT.

Factory, 9th street, near Coates, cor. Melon st.

Office, No. 3 North 5th street,

Philadelphia, Pa.

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern.—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,]

WILLIAM ROE, Sup't of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed,] G. A. NICOLL,

Sup't Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern.—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,] T. L. SMITH,

Jersey City, November 4, 1845. N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car. For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed,] JOHN LEACH,

Jamaica November 19, 1845. } 1y19 Sup't Motive Power

## NICOLL'S PATENT SAFETY SWITCH

for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee

G. A. NICOLLS,

Jan 45 Reading, Pa.

## TO RAILROAD COMPANIES AND MANUFACTURERS OF RAILROAD MACHINERY.

The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

THOMAS & EDMUND GEORGE,

245 N. E. cor. 12th and Market sts., Philad., Pa.

## RAILROAD IRON.—THE SUBSCRIBER'S

New Rail Iron Mill at Phoenixville, Pa., is expected to be ready to go into operation by the 1st of September, and will be capable of turning out 30 to 40 tons or finished Rails per day. They are now prepared to receive orders to that extent, deliverable after the 1st of October next, for heavy rails of any pattern now in use, equal in quality and finish to best imported.

FIG IRON.—They are also receiving weekly 150 to 200 tons of No. 1 Phoenix Foundry Iron, well adapted for light castings.

REEVES, BUCK & CO.,

45 North Water St., Philadelphia,

or by their Agent, ROBT. NICHOLS,

79 Water St., New York.

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs Bots and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes. 10f

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis are 5 feet from centre to centre, while in the new construction they are only 2 1/2 feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.		
4,324 Timbers, 11 ft. long, 3 x 6 inches =	68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 3,350 lbs. at 4 1/2 cts =		101 25
Workmanship free of patent charge =		600 00

Cost of one mile including the laying of the Rail ..... \$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

**JAMES HERRON.**

Civil Engineer and Patentee.

## FRANKLIN HOUSE,

No. 105 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—lean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,

D. K. MINOR.

ENGINEERS' AND SURVEYERS' INSTRUMENTS MADE BY EDMUND DRAPER, Surviving partner of STANCLIFFE & DRAPER.

No 23 Pear street, below Walnut, Philadelphia, 1y10 near Third,

## LAP—WELDED WROUGHT IRON TUBES

FOR

## TUBULAR BOILERS,

FROM 1 1/4 TO 6 INCHES DIAMETER, and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manufacture as those so extensively used in England, Scotland, France and Germany, for Locomotive, Marine and other Steam Engine Boilers.

**THOMAS PROSSER,**

Patentee.

1y25 28 Platt street, New York.

## RAILROAD IRON.

### MOUNT SAVAGE IRON WORKS

THIS Company are prepared to execute orders for RAILROAD IRON, of any pattern, and equal in point of quality to any other manufactured.

Address J. M. HOWE,

Pres't. Mt. Savage Iron Works,

Dec. 25, 1y\* Maryland.

## ENGINEERS and MACHINISTS.

## AMERICAN RAILROAD JOURNAL.

PUBLISHED AT 105 CHESTNUT ST. PHILADELPHIA.

Saturday, June 19, 1847.

### Chilled Cast Iron Wheels for Railroads.

We give in this number of the Journal a communication from Mr. Ross Winans of Baltimore, with a lithographic illustration of his plans of wheels for locomotives and cars. Mr. Winans has had great experience in such matters, and in this communication he gives the result of that experience for the consideration of railroad companies, and we therefore ask for it that attention which its importance, to every railroad company in the country, will justify.

We shall, in our next, give another lithograph, illustrating other wheels of different sizes and weights.

### Railroad from Tide Water to the Western Rivers.

This subject is one of vast and increasing interest, and, in our estimation, its importance is not duly appreciated by the masses who are most deeply interested in the early completion of the several important lines between tide water on the east, and the great rivers on the west. With these views we are ever desirous to disseminate information calculated to place the subject in its proper light—and therefore have commenced the publication, in this number, of an exceedingly well-written pamphlet—designed especially for *one*—yet equally applicable to all—of the great lines—as it contains a mass of statistical facts, useful alike to all who wish to understand the whole subject. We give only a part in this, and shall complete it in our next number.

### Massachusetts Railroads in 1846.

Having completed the publication of the Massachusetts Railroad reports for 1846, made in accordance with the requirements of the Legislature, we now give a tabular statement of them prepared by a careful and competent hand, for that excellent work, HUNT'S MERCHANTS' MAGAZINE. These reports may have appeared, to some of our readers, as the same thing, so often repeated—but they will find the figures changed in each report. The object of giving them entire is to put them on record for future reference and comparison.

Having completed the Massachusetts reports, we shall now publish the *New York* reports—if some friend will please send us a copy.

### New York Railroad Reports for 1846.

Will some of our readers please send us a copy of the *New York Railroad Reports* for 1846?

We insert in the present number, at the request of Mr. Amos Kendall, a synopsis of his arguments against the bill brought forward in the Virginia Legislature last winter, which proposed giving to the railroad interest in that State, the exclusive right to construct a Telegraph on the great southern mail route. We lay Mr. Kendall's synopsis before our readers, that they may have his views before them, tho' we do not exactly perceive its relevancy in the discussion of the merits of "the Telegraph system," presented to the consideration of our readers in the No. for 10th April. It is not surprising perhaps, that the railroad companies in Virginia should have wished to be the owners of the line of Telegraph through that State, as it might be a matter of convenience as well as profit, and we do not perceive that they aimed at anything more, in that respect, in Virginia, than the owners of Morse's Telegraph have endeavored to effect on a larger scale—in wishing to obtain for that plan of Telegraph, a monopoly in the conveyance of intelligence between New York and New Orleans.

We are ourselves opposed, as is well known, equally to "grasping monopolies," on the part of railroad companies, as in other matters, and it is precisely because we are opposed to such monopolies—while we believe the police of railroad companies to be invaluable for a Telegraph line—that we suggested, for the consideration of railroad companies, "the Telegraph system," recommended in our number of the 10th of April. We cannot agree with Mr. Kendall, that "such a system would pro-

duce four telegraph companies between New York and Washington, instead of one, three on the great southern line through Virginia, and some dozen or twenty between Washington and New Orleans, instead of one." On the contrary, it seems to us, that the system we propose, instead of leading to the disruption of the line between New York and New Orleans, would probably bring about several entire lines between these points.

This result would ensue, from the facility with which, on our plan, such lines would be gotten up. The plan, as developed by us in the Journal of the 10th of April, is, that railroad companies should put up, along their respective works, single lines of well secured posts, placing on them, as wanted, as many sets of perfectly isolated wires, as there may be a demand for; the posts and wires to be kept in order by the railroad companies, for a proportion of profits, or at a stipulated rent for each line of wire, and the wires to be worked by independent telegraph companies, with the most "comprehensive objects and views." Under such a system there could be no breach of continuity, as all that the railroad companies would have to do would be to keep the lines of wires in perfect order, and to repair promptly any accident which might occur, while the agents of the telegraph companies, at each end of the line, and at intermediate points, would communicate promptly, by uninterrupted wires, (and of course without the necessity of repetition) all messages, or letters, to be communicated by them. Of course gaps between railroad lines would have to be filled up by posts and wires, to be put up by the telegraph companies, as at present, along the common roads, but it would be a great object, and add much to the value of telegraph lines, to obtain, as on the plan proposed by us, the benefits of the police of railroads, where such works exist. We cannot doubt that a line of telegraph between two important points, as Philadelphia and New York, and much more so between two important and remote points—as New York and New Orleans—having the benefit of this police, would inevitably take away the business of a line not having the same advantages, even though the particular plan of telegraph of the latter might be greatly superior.

The more we reflect on the subject, the more we are satisfied that the above is the *true system*, that the railroad companies will find it a source of handsome profit to them, while the public will be the

gainers by it in a more prompt and certain conveyance of intelligence, at *lower rates* of charge.

We are gratified to learn from Mr. Kendall's letter, published in our last, that the owners of Morse's patent are willing to sell *absolutely* the patent right for lines not already bargained away. We have no doubt if they will do this *on reasonable terms*, that it will lead to Prof. Morse's patent being adopted generally in preference to any other plan of telegraph yet devised. But a charge of *one-half the profits*, or property, which it appears from Mr. Kendall's letter has hitherto been the charge on "the great lines," *merely for the patent right*, must inevitably deter many men from embarking in lines taxed with so heavy a bonus, and lead, ere long, to the adoption of other descriptions of telegraph, and probably to the introduction of other plans, combining equal advantages, with that of Mr. Morse.

In this matter, as in that of railroads, we go for giving the best possible returns to those who devise and construct works of so much utility; but in this, as in *some* railroads, we differ with the managers as to the best mode of ensuring the best returns—and as we usually speak our own views freely in relation to the management of railroads, so we shall in relation to other matters of this kind.

#### Magnetic Telegraph.

*Reasons why the Bill now before the Senate, granting a Monopoly of the Electric Telegraph to the Railroad Company, ought not to pass.*

1. Patent rights are *private property*, secured by the Constitution and laws of the United States, which the owner has a right to use or sell for the public good and his own emolument, in Virginia and every other state in the Union. This bill proposes to *compel* the owners of such property in an Electric Telegraph, to sell it to the railroad companies at a price not fixed by themselves, and in case of refusal, virtually forbids its use in this commonwealth below the Blue Ridge. And its object is, to *destroy* in lower Virginia all patent property in telegraph systems, which may not be owned and controlled by the railroad companies.

2. The railroad companies want to possess and use Morse's Telegraph, but they are unwilling to pay Morse's price for it—a price which he can readily obtain from others. These companies, therefore, come to the General Assembly and invoke the power of the state to prevent Morse selling to others, and compel him to sell to them at a reduced price!

3. Nothing but great public emergencies can justify the seizure of private property at a valuation, contrary to the will of the owner, and then it must be *for the use of the public*; but that process is proposed in this bill, not for the public good, but to *transfer property from one owner to another* who cannot buy it on terms acceptable to himself!

4. Morse's patents are no more a monopoly than a man's horse, house or farm is a monopoly. If his telegraph, or his horse, house or farm is more valuable than his neighbor's, it is no good reason why the General Assembly should be invoked to compel him to sell it to one neighbor at a price less than he can get from another.

5. That Morse's Telegraph is believed to be very valuable, is given as a reason why he should be compelled to part with it for the benefit of the railroad company. See, says the railroad company, how rich this man is to be, from the use of the instrument he has spent all his means and fourteen years of study, toil, and privation, in perfecting; *we must have a share of this wealth*; and if you, old and honorable Virginia, will but compel him to take us in as partners, on our own terms, we will give you

*two-fifths* of these enormous gains! What is this in principle, but asking the power of law to compel the rich man to divide his wealth with his neighbor who promises the state a part of the gains for the use of its power? All Professor Morse's wealth is prospective, perhaps visionary. He has not realized from his telegraph \$3000 in cash.

6. The railroad companies say, that Morse's Telegraph is a monopoly, admitting at the same time that there are other systems which can and may be used. The plan of this bill is to make it a *real monopoly* by forcing it into connection with the railroad companies, and forbidding any other to be constructed below the Blue Ridge.

7. The grant of monopolies is only excusable when great public improvements, really valuable to the people, can be obtained on no other terms, but here it is proposed to *stop* a valuable improvement that it *may be made a monopoly*; and the people are to be deprived of all the benefits of competition, not because it is necessary, but because it is the interest of the railroad companies.

8. The bill proposes to create *three separate* and independent telegraph companies on the mail line through Virginia, each with power to *charge at discretion*. At this rate, there would be eighteen or twenty companies between Washington and New Orleans, which of itself would destroy the public utility of the telegraph.

9. Why should the state go into partnership with the railroad companies, first to *force* an interest in the telegraph, and then to divide the profits, getting, however, but *two-fifths* of the whole? Would it not be fair and more in conformity with those principles which should govern business transactions, to go into partnership with the present lawful owners, and take all the profits thence resulting? *This she may now do if she chooses, taking the structure built at cost, and continuing it through the State, or at least as far as Petersburg.*

10. This bill has no provision requiring the railroad company, in case the monopoly is granted them, to take at any price, the structure now up from Washington to Fredericksburg, and the materials prepared for the line through to Petersburg.

11. If this bill passes, the people of lower Virginia will *certainly* have a telegraph monopoly fixed upon them in Morse's system, or some other. If not, they will have a chance for—nay, may *expect*, competition at no distant day, if the business shall turn out to be as profitable as anticipated. At least, the defeat of the bill leaves a *chance* for competition, while its passage will not.

12. In May next, if permitted, the owners of Morse's Telegraph will give to the Virginia towns on the main mail route, the news from European markets, in a few minutes after its arrival at Boston or New York, and as soon as it reaches Buffalo and Pittsburg, placing the merchants of Virginia on a footing with those now reached by the telegraph in other sections of the Union.

13. The following is extracted from a paper laid on the desks of the Senators by the railroad interest, viz: "It may be objected that the proprietors of Morse's patent will not sell the right to use it to the railroad companies, and that in consequence, the transmission of intelligence will be interrupted by giving the privilege of constructing the Telegraph to the railroad companies. The owners of Morse's patent *will undoubtedly not sell the patent right*, and would probably refuse to connect with the railroad line of Telegraph through Virginia, if allowed to construct a *separate parallel line themselves*, along which they could transmit all the *through intelli-*

*gence*, and derive the whole profit from it. But it can scarcely be supposed that if the patentees are not allowed to construct such a line, they will not be willing to sell the patent right on *fair terms*, or refuse to connect their line North and South of Virginia, with the line through Virginia, when they would be much more injured by such a proceeding, than the Virginia companies. If, however, they should refuse to do so, no doubt is entertained that companies would *speedily be formed South of Virginia and North of Washington, to connect with the railroad line through Virginia on some other plan of Electric Telegraph.*"

Upon this state of the case, it cannot be doubted that the passage of the Monopoly Bill will postpone indefinitely the construction of any Telegraph at all through this State.

Professor Morse and his associates will not be forced to sell, because they can approach New Orleans through the West, where every facility is offered them, with the same ease as through the South; and if they could not, they might not be justified to submit to the principle, that men may be forced by law to dispose of their property at reduced prices, because other men covet its possession.

They would refuse—and what then? "Why," says the Railroad Company, "no doubt is entertained that companies would speedily be formed South of Virginia and North of Washington, to connect with the railroad line through Virginia on some other plan of Electric Telegraph."

And with a Telegraph admitted to be the best ever yet invented, offered to be extended to her capital in sixty days, and already nearly completed for half the distance, the merchants and people of Virginia must wait until Mr. Robinson has found "*some other plan of Electric Telegraph*," and has organized a series of companies, *all the way from New York to New Orleans*, "to connect with the railroad line through Virginia!" This is to refuse the benefits of the best Telegraph now offered, for the chance of getting an *inferior* one some years hence! For what reason? Simply to enable a grasping monopoly to add a war of Telegraphs to its present wars with other railroad and steamboat companies, to the positive detriment of every interest involved, public and private—even its own! And, was there ever any thing more strange, than an application to the General Assembly to sustain such a proceeding by law?

It has been avowed, that the railroad company do not want a Telegraph built at all, lest the people of Virginia should save by its use the time and money now spent in travel, and thus reduce the profits of the railroad stockholders! Is it their design to prevent its construction? Such would be the certain effect of the legislation they solicit.

#### PUBLIC GOOD.

##### Philadelphia and her Means.

We learn with pleasure, says the U. S. Gazette, that the engineers of the Pennsylvania railroad are actively and successfully engaged in the labors of their profession, and that many miles of the road will be under contract in a week or two. The work is of the utmost importance to our city, and every Philadelphian must feel solicitous to have it advanced with all the rapidity of which a work of such magnitude is susceptible. It is a truth, of which some of our citizens have not a full appreciation, that Boston capital is lavishly poured out in Ohio, so that a continuous steam communication will, ere long, be had between Boston and Cincinnati. Meantime, Philadelphia is the natural and favorite mart of the West, and all that is necessary to secure to ourselves a continuation and regular increase of the

business of the city, is to be active, liberal, prompt, and ready to meet the efforts of other places with the means we have. There is an immense capital in Philadelphia—we mean a cash capital; but there is still a greater business capital in the credit which our merchants have for liberality and fair dealing; and these, connected with the proper facilities of trade, must continue to augment our business, and continue the prosperity so evident in the present season's transaction.

#### Railroad Stations.

We find the following remarks, on the propriety of "grouping" railway stations, in the Portsmouth (N. H.) Journal, of 12th inst. They are so much in accordance with our own views, that we are almost led to believe that they were written for the Railroad, instead of the Portsmouth Journal, and were sent by mistake to the wrong printing office. They are at all events now in the proper columns.

Correspondence of the Portsmouth Journal.

"DEAR SIR: I am daily hearing much said in regard to the location in this vicinity of the stations of the Portsmouth and Concord railroad, and would take the liberty to suggest a few reasons in favor of grouping the stations of both our railroads. This is the easiest and most unobjectionable mode of entering the town. A short distance beyond the Stocking Factory the two roads intersect, and by retaining the grade of the present road, no street no highway is interfered with in the least. This is an item of the first importance in respect to the convenience and safety of the public.

"In England, independent crossings are required in all cases, and this is fast coming to be the demand with us; and until this is obtained, safety from fearful casualties and a sense of security will not be secured to the moving public. Besides being the easiest and most unobjectionable, it will afford the greatest facilities to the public. Trains will be arriving and departing on both roads more or less in concert—passengers and freight coming on one, are to leave on the other. Such being the case, to have the stations at a distance from each other, would be subjecting every passenger to the inconvenience and expense (both utterly needless) of crossing over from one road to the other, and imposing a tax of fifty cents a ton, and little less than that on any article of merchandize, however small, that may have to be re-shipped. Now, to impose this inconvenience and tax upon the patrons of the road, would be as impolitic as it would be needless and unjust.

"The above considerations receive much inforcement from experience. There are not a few places in this country, and some most striking ones may be cited from Europe, where vast sums of money are being spent in rectifying mistakes on this point. At Schenectady, in New York, independent stations were erected, but the demands of the public prevailed, and large sums of money were expended to group the stations, and the large sums previously expended thrown away.

"Providence, R. I., is another instance where local interests and influences prevailed, and for years subjected the public to delays, inconveniences and expenses forty fold greater than all the benefits individuals derived. But the demands of the public have been heard, and the stations of the three roads entering that town are to be grouped in a manner that will be as admirable as the former arrangements have been abominable.

"In England, too, the same experience has been gone through with, and the same results, though on a larger scale, come to. In Liverpool, all the passenger trains, except one, are grouped, and the ad-

vantages are so obvious, that immense sums are being expended at other points where several railroads terminate. In Birmingham, a field of some fifteen or twenty acres has been appropriated to the purpose, and five or six roads have abandoned their former localities, and now terminate under one roof.

"In Leeds, the same thing is being done. The station of the Manchester road has been brought farther into town, and the Bradford road has been extended over a mile through the most densely populated parts of Holbeck, to terminate at the same station. In Manchester the Liverpool, Birmingham and Leeds roads all had independent stations. The inconveniences, however, were found to be so great that a junction line a mile and a half in length has been built, upon iron and brick columns and arches some thirty feet high, at an expense of near a million and a half of dollars, to bring the Liverpool and Leeds stations together; and another junction line of about the same length is now being built to bring the Birmingham station into the same place. In this case, we see a sacrifice of between two and three millions of dollars, besides an abandonment of all former arrangements and expenditures made to effect them, all upon the altar of public convenience.

"A plan for the same thing is contemplated in the city of London, and the day is not far distant when the present whisperings of complaint and irritations under inconvenience and useless expenses, will ripen into stern demands for some common centre in our own New England metropolis. We may not be ripe for it now, and may dissent from the opinion of its practicability, but that the convenience of the public would be vastly promoted by having all the stations in Boston grouped together, and the economy of transportation and travelling would be much increased, no one can question.

"Now, with such experience before us, with such facts staring us in the face, who can urge upon the managers of the Portsmouth and Concord road a policy directly the opposite. The grounds in other parts of the town may, in themselves considered, be convenient enough, and perhaps more so than the location of the present station, but the interests of the public, and consequently the interests of the roads, demand that the stations of the two roads should be side by side, and to this result I trust and believe the observations and good judgment of the managers of the new road will bring them."

#### Baltimore and Ohio Railroad.

We learn from the Argus that at a meeting of the Board of Directors of the Baltimore and Ohio Railroad Company, recently held, the President, Mr. McLane, read a paper concerning the present condition and future prospects of the company, and recommended: 1st, that measures be taken for the extension of the road westward along the banks of the Potomac and Savage rivers to the Maryland line—and 2d, that the road be also extended to the south side of the Basin, under the authority given, and contract heretofore made, with the City Council.

The extension of the road thus provided for, will take it to a point from which it can hereafter be carried to Pittsburg, Wheeling, or any more southern point on the Ohio river, being common to all.

We also learn that the following resolution, in relation to the free travel on the road, was adopted:

*Resolved*, That hereafter the privilege of free travel on the road be confined to the president, directors and depot agents, and to other officers of the company when on business of the company, and to the presidents of those roads on which a similar privilege is extended to this company, and to such others to whom the board, or the president under the au-

thority in him vested, may hereinafter grant a free ticket.

#### Portland, Saco and Portsmouth Railroad.

The annual meeting of the stockholders of the Portland, Saco and Portsmouth railroad company, says the Portsmouth Journal, was held at Portland on Monday last. The following gentlemen were chosen directors for the ensuing year:

David A. Neal, of Salem; Stephen A. Chase, of Salem; Benjamin T. Reed, of Boston; Ichabod Goodwin, of Portsmouth; John D. Lang, of North Berwick; Josiah Calef, of Saco; Charles E. Barrett, of Portland.

Mr. Whitney, the projector of the Atlantic and Oregon railroad, delivered an address recently, before the members of the Maine legislature, setting forth the practicability of the enterprise, and the important bearing which its completion would have on the commercial interests of the United States. The legislature have passed resolutions in favor of the work.

#### Railway Traffic in England.

From our official returns, says the Railway Chronicle of 15th May, it appears that the amount of traffic for the last week, on upwards of 2,730 miles of railway, was £161,457, thus accounted for:—£84,234 for the conveyance of passengers only, £39,243 for the carriage of goods, and a remainder of £37,980 for passengers and goods together, not respectively apportioned; being an increase of £22,643 over the corresponding week of last year, when the mileage was about 1,990.

#### Allegheny Portage Railroad.

A correspondent at Johnstown, Cambria county, says, "It is almost unnecessary for me to tell you that we are doing a tremendous business this season on the railroad. The tolls for the month of May exceed those for the month previous five thousand dollars, and the business rapidly increasing."

#### Closing of the Contracts.

We learn by the Hallowell Gazette that at a meeting of the Directors of the Kennebec and Portland Railroad, at Augusta, on Thursday last, the grading of the whole line from North Yarmouth to Bowdoinham, including the branch to Bath, was let out to three companies, and the contracts closed.

The line was divided into three sections. A company from Maryland takes one third, a company from New Hampshire one third, and a company at Brunswick Me., the other third, including the Bath branch.

The terms of these companies are highly favorable to the corporation; being much less per mile than the estimate of the engineers.

The grading, therefore, on the entire line from North Yarmouth to Bowdoinham will be immediately commenced.

#### NASMYTH'S STEAM-HAMMER.

On Tuesday, one of Mr. Nasmyth's recently invented steam-hammers was put into operation at the Shrubbery Iron-Works, belonging to Messrs. Thornycroft & Co., near this town. It is the only one in the neighborhood, and its first operations were directed by the inventor, with his own hands. Several gentlemen, interested in trades to which the invention is applicable, were also present, and watched its performance with great attention. It has been justly said that the steam-engine will alike forge an anchor, or polish a pin, impel a railway train, yet

spin and weave threads rivaling gossamer; in the machine before us, however, these wondrous powers, in other instances separate, are astonishingly heightened by their combination. Vast power and the most delicate touch are united; pieces of iron 7 or 8 in. in thickness, by a single blow were broken; while an egg in a wine glass, placed under the hammer, was so lightly touched that its end was only fractured, as if by the gentle tapping of a spoon. Nuts were broken without injury to the kernels. The hammer itself, we should state, weighs about 2 and a half tons. No description of the machine could be understood unless accompanied by drawings. We content ourselves, therefore, with a short notice of a main principle of its construction. The piston of a steam-engine commonly works upward from the cylinder; in the machine in question, the cylinder is placed at the top of two very strong iron cheeks, and the piston works downwards; to it the hammer, which runs between the cheeks or framework, is attached, and the motion is communicated by the admission of steam into the cylinder in the ordinary manner. The regulation of the motion is effected by springs and screw-work, opening and closing valves connected with the steam-box or cylinder; and so nicely are these calculated and adjusted, that the machine is easily worked by a single man from a handle attached to the screws. The full fall of the hammer, 2 and a half tons weight, as we have noticed, is in reality 4 feet, but it is not considered safe to work it with a greater fall than 3 ft. 9 in. The weight of such a blow, and to which an impulsive power also can be given, can hardly be calculated; scarcely anything, indeed, seems capable of withstanding its crushing effect. About 25 tons of iron, besides more than a boat load of timber, are used in the foundation. One purpose to which we saw the machine applied, was shingling some of the best charcoal iron. The exhibition afforded much satisfaction to all present, and Mr. Nasmyth was warmly congratulated on his success in adding such a vast, yet manageable, power to our mechanical resources.—*Wolverhampton Chron.*

#### Atmospheric Railway.

The Railway Chronicle of May 8th says that engineering London was suddenly thrown into unusual excitement on Tuesday last, by the announcement that the CROYDON ATMOSPHERIC PIPES were pulled up and the plan abandoned. On making inquiry, we found that it had been decided to abandon the system; that the Atmospherics was not in operation; that locomotives were doing the work, and that the Atmospheric was doomed.

We confess our surprise at this sudden resolve. The same resolve might have been taken any time these twelve months with more show of reason than appears now on the face of the question. Never before was the Atmospheric doing so well, going so regularly, working so economically. The directors have for a couple of months been working a contract with Mr. Samuda, which contract gives them atmospheric power at less cost than the locomotive, and Mr. Samu-

da is said to have been well pleased with his contract, and the public service well performed. We were indulging the pleasing hope that now at least we should have twelve months' work of a new invention, a time by no means too long for such a trial as should enable us to decide on its merits. This trial is, however, to be cut short at its beginning.

Another reason encouraged the expectation that the trial would not be cut short now. The South Devon is only just completed; it is to have many advantages which this wants; more powerful engines, larger pipes, greater maturity of the invention. The opening of the south Devon would have formed, by its failure or success, a corroborate reason for ultimate abandonment or otherwise. We should have learned much more that would be useful to the public from the continuance of the Atmospheric for twelve months at least, than from its sudden stoppage; and the company would at least have given some knowledge to the public in return for all the cost, time and public inconvenience which an unproved experiment always entails.

We are the more sorry for this resolution, because, although we have from the beginning been regarded by the Advocates of the atmospheric system as its inveterate enemies, we have really opposed only what appeared to us the errors of the system; and while opposing its erroneous application, we have earnestly supported its having a fair trial. That trial we thought it would have had on the Croydon, and we are disappointed at this sudden resolution of the Board, which will, we think, give the advocates of the system something to complain of; and deprive all parties of the advantage of an unbiased decision.

We remember, too, that a committee had just been appointed by the Institution of Civil Engineers, consisting of Mr. WYNDHAM HARDING, Mr. FROUDE and Mr. SCOTT RUSSELL, to ascertain, by actual trials, the power required to move atmospheric trains at high speeds;—an investigation, the result of which would inevitably have thrown some light directly or indirectly, on the value of the system. This, we suppose, will not now take place, and is lost to the profession—unless, indeed, Mr. Brunel should offer the same privileges on the South Devon.

The practical reasons which have carried the point with the directors are variously given. We think the actual state of the matter is as follows:—When the Atmospheric was originally resolved on by the Croydon directors their third line to Croydon was to be an isolated line, doing only the Croydon traffic. The case is now altered; and the Croydon line has become a trunk line for the Epsom traffic and other future extensions. The Portsmouth line, too, is now a joint concern with the South-Western, which will have to work its own traffic over part of that line. Moreover, the Croydon is now, from amalgamation, one with a large and important group of lines, all worked by locomotive power, under one management and with one stock. The Croydon Atmospheric, also, is not complete: it does not

reach London; so that, in order to work the Epsom traffic with the present length of Atmospheric tube, there would require to be one set of locomotives at the London end of the line and another at the Croydon end; in short, two set of locomotives in addition to the Atmospheric, all working on one little line.

The sum of all these inconveniences is doubtless very great. But they are precisely the sort of inconveniences we have always pointed out as objections to any *exceptional system*, be it in gauge, or in power, or anything else. These inconveniences have all been visible ever since the Brighton and Croydon joined, and might have been acted on any time the last ten months, instead of going to all the expense of additional machinery and length of line.

What we object to is not the ultimate abandonment of the Atmospheric, which we have always declared very unlikely to supersede the locomotive in general, but the absurdity of incurring all the cost of the experiment, and suddenly abandoning it, one fine morning, when some little practical inconvenience, which had always been foreseen and predicted, came to pinch a little too hard; that is what, as advocates of fair-play to the Atmospheric, we must regret.

As the matter stands now, thus much has been proved—that the atmospheric pipes on the Croydon were too small, as we always said they were—that with light loads any desirable speed might be obtained—that the Atmospheric can work a regular and uniform traffic with fair regularity—that a single line may be worked with safety. But it has not disproved what we have always asserted, that for versatility, convenience, suitability to sudden emergency, adaptation to variations of traffic, and concentration of control, the locomotive possesses practical advantages which will make it very difficult for the Atmospheric or any stationary system to supersede it even on any considerable portion of the railways of the country. With these inevitable disadvantages, which we have always kept before our readers, we still ask them to await with patience the thorough trial of its merits, which we have no doubt Mr. Brunel will give it on the South Devon.

#### Richmond and Ohio Railroad.

In presenting the claims of this work to the consideration of the people of Virginia and the public, there are difficulties to be encountered of no ordinary character.

Throughout the Commonwealth, until within a very brief period, there has existed a very general apathy in regard to internal improvements, and for this reason, the great natural advantages of the State have been greatly overlooked in other parts of the Union.

The project of opening a continuous railway from the tide waters of the Chesapeake to the Ohio, through the heart of the State, is, in the opinion of those who have considered it, unsurpassed in importance by any other, whether regarded in relation to the direct bearing of this magnificent work upon the prosperity of Virginia, or in reference to

its character as a great national improvement.

In different parts of the state, however, there are strong predilections for merely local improvements, which have hitherto prevented any concentration of public sentiment in favor of any great state work as a basis of a system of railroads compatible with the interests and dignity of the Commonwealth.

Many, also, of the most intelligent and influential citizens of the State, have advocated a system of canals as preferable to railroads. Waiving, however, all discussion of this question, it is proposed to present some of the claims of the Richmond and Ohio Railroad, and a candid and impartial consideration of the subject is solicited.

The charter of this grand railway, authorized by several recent acts of the Legislature, is, beyond question, the most liberal in its provisions of any ever granted in the Union.

Among its provisions are the following most important:—

*First.* The company have an open charter from Richmond to some point on the Ohio, at or below the mouth of the Great Kanawha. Below Lynchburg, the route is confined to the south side of James River. This is, however, no objection, as it is in all respects the best route for the road, and the restriction was imposed to prevent an interference with the canal along the north side of the river.

*Second.*—The company have the right to construct an indefinite number of lateral roads twenty miles in length, on each side of the main stem.

*Third.* The capital stock is \$12,000,000, with a privilege to expend \$600,000 for lands west of the Blue Ridge, within the space of twenty miles of the road, and \$1,400,000 for various mining and manufacturing purposes within the same limits.

*Fourth.* The capital stock is exempt from taxation, as are also the dividends, unless they exceed six per cent per annum.

*Fifth.* The company have two years, from the 22d day of March, 1847, to enter upon the construction of the road, and after the expiration of three years, there must be completed and put in operation, annually, thirty miles, so that at least sixteen years are allowed for the completion of the road, estimating its whole length at four hundred miles.

*Sixth.* Full corporate powers are given as soon as one million of dollars has been subscribed, and one-fourth part thereof actually paid in.

*Seventh.* The maximum charge for travel is four cents per mile for each passenger, and from four to 8 cts. per ton per mile for freight.

*Eighth.* The Legislature can neither alter, amend or modify the charter; but after the expiration of sixty-six years from the 22d day of March, 1847, the State may purchase all the capital stock at par, on giving one year's previous notice.

*Ninth.* The company have the right to construct an electric telegraph along their road, and are unrestricted in their charges for conveying intelligence upon it.

*Tenth.* In case of forfeiture, by reason of

failing to comply with the requisitions of the charter, it shall extend only so far as to prevent the company from completing their road.

*Eleventh.* The charter is subject to the general railroad law of the state, excepting as above stated. This law contains general provisions necessary to all charters, and has nothing peculiarly important.

Such are some of the provisions of this most extraordinary charter, which has been pronounced to be "one of the most liberal and favorable in its provisions ever granted to any company." Indeed it appears that Virginia regards the construction of this road as of vital importance to the future prosperity of that State, and has accordingly held out great inducements to capitalists to embark in that enterprise." (*See Am. R. R. Journal, March, 1847.*)

In relation to the privilege of expending \$600,000 for lands, it may justly be affirmed that the judicious expenditure of that sum for lands in the interior of the State, would, upon the completion of this work, give the company a vast landed interest, which would be worth to them \$5,000,000. The manufacturing privileges are also of immense value, for it should be borne in mind that this great railway will pass through one of the most important coal and iron regions in the United States, embracing an inexhaustible water power, and all the other materials for manufacturing wealth.

These extraordinary privileges are beyond the reach of legislative interference for at least sixty-six years, unless they are abused by the company. This limitation gives the charter even greater value than though it were on the face of it perpetual. Questions might arise, whether any legislation could prevent subsequent legislatures from interfering with such broad and ample privileges in case their exercise should be deemed incompatible with the public good, but the limitation in the charter removes all doubt on this point and renders the right reserved to the Commonwealth to purchase the stock at par, at the end of sixty-six years, no objection.

The able editor of the American Railroad Journal, in speaking of this charter says, "We repeat that the entire provisions of this charter are upon the most liberal scale, and 'we are happy that so important a line of communication, as this will most assuredly prove, will by this charter possess all the requisite advantages for rendering it a profitable concern in future, while it will enable the managers to build a good road, and eventually to furnish the travelling public with the very best accommodations.'"—*Am. R. R. J. Vol. 19, p. 682.*

The general direction of this road will be along the valleys of the James and Kanawha rivers, whose branches interlock each other, so as to leave only the Allegheny proper to be surmounted. From the vicinity of Lynchburg several routes have been surveyed across the country, between these rivers. At whatever point the valley of the Kanawha is approached whether at the Horse-Shoe bend; the mouth of the Greenbrier, or the Gauley,

the route will be continued thence down the Kanawha to a point some fifteen miles below Charleston, and thence diverge to the mouth of the Guyandotte. The route which has been most accurately surveyed, and which is best known, is that which crosses the Allegheny, by the way of Dunlop's Creek, Fork river, and Howard's Creek in the vicinity of the White Sulphur Springs. The summit on this route is 1987 feet above tide water, and about 1400 feet above the mouth of the Guyandotte on the Ohio, and about the same elevation above Buchanan, the termination fixed for the canal.

In surmounting this summit the road will pass through a tunnel. The highest grade ascending to the west will be only about seventy feet per mile, for the short space of about five miles, and in ascending from the west, the highest grade will be only forty feet, for the distance of about three miles, so that all the heavy grades on the route will be in making the pass of the Allegheny, and that too within the space of about seven miles. At this place an extra engine could be employed to pass heavy trains loaded for lighter grades. In the direction of the heavy grade from west to east there will be no grade exceeding forty feet per mile, and that only for three miles and one-fourth. Of the balance of the route over the mountain region only one-half mile will be thirty-three feet to the mile, and the balance not exceeding twenty feet.

More accurate surveys of this route will probably reduce these grades, so that the highest will not exceed sixty feet per mile, and that only for five miles on the east slope of the mountain. The surveys already made, show that from the White Sulphur Springs, near which the heavy grades on the west slope will terminate, to the place of divergence in the Kanawha valley, the heaviest grade will not exceed twenty feet, and probably not more than twenty miles of the whole route will exceed that grade.

From the said point of divergence a deep cut on both sides of the dividing ridge between the Kanawha and the Mud river, and a short tunnel under the same, will be necessary. Beside this, the route will have not the least difficulty thence to the Ohio.

On the eastern slope of the mountain, between the mouth of Dunlop's Creek and Lynchburg, the route will lie along the Jackson and James rivers, in which no heavy grades will be encountered. Indeed this great railway, in point of grades, will most favorably compare with any other great line across the Alleghenies. Should the route take a more southerly direction, and strike the New River in Montgomery county, the gradients will be about the same.

The pass over the Allegheny on the route by the White Sulphur Springs is depressed much below that of the more northerly routes, being only above tide water, 1987 feet.

On the Baltimore line to Pittsburgh, it is 2290 feet.

On the Pennsylvania line, 2491 feet.

On the Great Central line to Pittsburgh, 2184 feet.

This line is therefore from 197 to 404 feet depressed below the others.

In respect to the gradients of this route, it will be found to be equally favorable on comparison.

On the Richmond and Ohio, the highest grade will be probably not exceeding say, per mile, 65 feet.

On the Western Railroad at three points, it is 80 feet.

On the Baltimore and Ohio, it is 82 feet.

On the Baltimore line to Pittsburg on the east and west slope, for twenty-seven miles, 66 feet.

On the N. Y. and E. for ten miles on the west slope, 60 feet.

And on the east slope, about the same distance, 57 feet.

On the "Great Central," according to Mr. Roebbling, [See *Am. R. R. Journal*, Feb. 27, 1847,] the highest average grade for thirty-two miles, ascending the west will be forty feet, varying from 26½ to 45 feet per mile. But, he remarks, "truth, however, prompts me to state, that in consequence of the great rise and fall in the Central road, the total equated distance from Pittsburg to the seaboard, appears to be in favor of the Baltimore route, from this it would follow that road will possess an advantage over the Central road in the transportation of freight, but of freight only, provided all the other relations are the same."

These remarks relate chiefly to the gradients generally upon these routes, without furnishing any certain data from which to compare their grades ascending to the east, in the direction of the heavy trade; but it is a matter of fair inference that in this respect, the Richmond and Ohio stands pre-eminent.

A glance at the map of the United States will present this line in a most favorable aspect in other important particulars.

The great railways which span the Alleghenies have all the same general direction from the seaboard to the lakes and the Mississippi valley, and are all nearly of the same extent.

Assuming New York on the tide waters, and Cincinnati and St. Louis, in the western valley, as the great centres of trade, it will be seen that these cities are nearly in a right line, and that the western termini of all these great lines of railway, except the Richmond and Ohio, are to the north of said direct line, and that Guyandotte is also from two to three hundred miles below the other termini, and opens the shortest and most direct route from the valley to the Atlantic.

The Virginia line therefore taps the Ohio river, at the most favorable point to divert the ascending trade and travel of the Ohio to the tide waters, and as will hereafter appear, open the cheapest communication between New York and Cincinnati. In these advantages this great line cannot be supplanted by any more southern route, for the obvious reason that any such route would not only be of greater extent between the valley and the Atlantic, but would also be out of the general course of business and travel which is from east to west or from north to south.

But this is not all. The more northerly routes will all be more or less obstructed by ice and snow for several months in the year; while this, from its more southern location, will experience very little if any inconvenience from that source.

This fact bears with great force upon the lines terminating at Philadelphia, New York and Boston, and more especially in so far as they will assume the character of rival lines, and depend upon the trade of the Mississippi valley.

In consequence of these difficulties on the great northern routes, and the dangers of the lake navigation in the fall and winter seasons, the trade and the travel between the east and the west are subjected not only to vexations and uncertain interruptions, but to serious damage and pecuniary embarrassments. Many a merchant can trace his total failure to this single cause, and many a western farmer also is subjected to a ruinous depreciation in the price of his produce. These very serious evils would, to a great extent, be removed by the completion of this great central-trunk through Virginia, where the products of the west would find through it an open passage to the Atlantic cities during all seasons of the year.

Hence, late in the fall, through the winter, and early in the spring, immense quantities of merchandise and produce would be transported over this route, while its rival thoroughfares would be obstructed.

The chief cities of the west being south and west of the western termini of these great arteries of business, it is evident from a moment's reflection, that there would be an accumulation of trade and travel upon the more southerly routes from those more northerly. For instance, none of the Atlantic cities would trade with the west through a channel more northerly than its own, while much of the business of each would flow through a more southerly line. Boston would carry on her rapidly increasing trade with the west as much as possible, through her own works, and yet at those seasons of the year, when they were even liable, to obstructions, she would transact much of her business through the New York and Virginia routes. The same remarks will apply with greater or less force to Philadelphia and Baltimore. But to none of the Atlantic cities does this view apply with so much force as to New York. Having through this great central railroad the most direct communication with the Queen City of the West, open at all seasons of the year, who does not see that the construction of this work will introduce a new era in the trade and commerce of the great emporium. While her own great works are obstructed, and the noble Hudson itself is frozen over, New York can still, through the Richmond and Ohio Railroad, carry on an active trade with Cincinnati and other cities in the west, and thus extend her business through the entire year, instead of crowding it into eight or nine months as at present. On reference to proper authorities it will be found that the average time the business of the Erie Canal has been obstructed by ice

during the last twenty years, is one hundred and twenty-four days per annum; and that of the Hudson river, from the same cause, is something over ninety-one days. Now, then, considering the hurry and confusion incident to the closing of navigation, and the delay and uncertainty upon its opening before business assumes its regular course, and the time of the interruption of business from this cause, may be safely stated at four months and a half in each year. New York then has a direct and most important interest in the construction of this great central improvement of Virginia. By means of her own canals and railroads, she can with one hand grasp the trade of the West, in successful competition with her eastern rival, Boston—while, through this Virginia line, she can control with the other hand, a majority of the same trade, as against Philadelphia and Baltimore, her powerful competitors on the south. [See *Hunt's M. Mag.*, Sept., 1846.]

These considerations attach great importance to the fact, that this route is the most southerly of all the great lines across the Alleghenies, and justify the inference, that there will be a vast accumulation of business upon it from all the more northerly lines, during the cold seasons of the year. On the other hand, during the seasons of low water in the Ohio, which occurs so frequently in that river, and occasions great delays and interruptions of trade and travel, this Virginia route will have a very important advantage over its northern rivals, inasmuch as it will tap the Ohio so low as almost entirely to obviate these objections to the Baltimore and Philadelphia lines. That Baltimore fully appreciates the force of this remark, is evidenced by her long and strenuous efforts to make the terminus of her great work at Parkersburgh, or some point below Wheeling. The able advocate of the "Great Central," in relation to this subject fully sustains the importance of this view. In speaking of the Philadelphia line he remarks that, "Owing to its more southern location, this road will be less impeded by snow than its northern rivals, which is also an important advantage."

Now when it is considered that the summit level of the Great Central is one hundred and ninety-seven feet above that of the Richmond and Ohio, and some one hundred and fifty miles farther north, it will be seen that if what Mr. Roebbling has said of the advantage of the Pennsylvania line over its northern rivals be true, as undoubtedly it is, the same will apply with much more force to the Richmond and Ohio.

Again in relation to the Virginia line, the same writer remarks, "This route when constructed, will form the most direct communication between the Atlantic and the West;" and as compared with the Baltimore road we have his further testimony, "that the Richmond and Ohio road will prove the most formidable rival of the Baltimore and Ohio, as it will intercept all the trade of the Ohio river below Parkersburgh, and will not allow it to reach the termination of the Baltimore and Ohio line."

These admissions, coming from an able and candid advocate of a rival line, are entitled to great weight. And it is well worth the remark, that the Philadelphians, in striking out the plan of their "Great Central," which is a most magnificent project, have virtually abandoned the contest for the business of the Ohio valley.

While the friends of the Virginia line believe, therefore, that they hold a vantage ground in contending for this noble prize, they would cheerfully respond to the liberal sentiment expressed by the eloquent advocate of the Philadelphia line, "that a generous, high-minded and honorable rivalry shall prompt us in the pursuit of our enterprise, we will remember that the great west offers room for us all."

Another distinguishing feature of the Virginia road is its central location in the Union. As a great thoroughfare between the Atlantic and the valley-world of the West, it has more of a national character than any of its more northern rivals. Extending from that point of the Ohio river which approximates nearest to tide water, this great railway will pass through nearly the geographical centre of the United States from North to South, and connect with the mouth of the Chesapeake, which has the best harbors and naval station on our coast.

The mouth of this noble bay, as a commercial centre of the republic, would, by means of this road extending into the heart of the west by the shortest route, open greater facilities for trade with all parts of the Union than any other point on the Atlantic coast. Startling as this assertion may seem, it will be made evident by considering the distances of the several great lines, between Cincinnati and the Atlantic cities:

From Cincinnati to Richmond, by the Richmond and Ohio Railroad, the distance will be	560 miles.
To Baltimore, via Wheeling,	757 "
To Philadelphia, via Pittsburg,	877 "
To New York, via Pittsburg,	963 "
To New York by Ohio and Erie Canal,	1126 "
To New York, by the Lake and N. Y. and E. Railroad,	1050 "

Thus by the present routes, the distance from Cincinnati to tide water is altogether in favor of the Virginia line, varying from 197 to 566 miles.

But should it be said that at Richmond you are 130 miles from Norfolk, and 126 from the Capes, it may be replied that at New York you are 20 miles from the ocean; at Philadelphia 105 miles, and at Baltimore 200 miles; so that making these additions, the distances would stand:

From Cincinnati, via Richmond, to the Ocean,	690 miles.
From Cincinnati, via Baltimore and the bay,	957 "
From Cincinnati, via Philadelphia and Del. river,	982 "

still showing a great balance in our favor. But let us take another view, and suppose the Baltimore line extended to Wheeling, and thence to Cincinnati, and the "Great

Central" completed through to St. Louis, and how will stand the account then?

From Cincinnati to Richmond, as before, 560 miles.

From Cincinnati to Baltimore, estimating the distance from Wheeling to Cincinnati to be 250 miles, 621 miles. From Cincinnati to Philadelphia, counting the distance by the improved route from Philadelphia to Pittsburgh, only 330 miles, thence to Steubenville, 50 miles, thence to Cincinnati 250 miles, and we have 630 miles. And still the distance is in favor of the Richmond and Ohio Railroad. These distances from Steubenville and Wheeling by railroad are only estimated distances, and not known to be entirely correct.

But as between the city of New York and Cincinnati, the distances by these great lines stand thus:

By the Richmond and Ohio, via Baltimore,	910 miles.
By the Baltimore and Ohio, via Wheeling,	939 "
By the Philadelphia line, via Pittsburg,	963 "

It must in candor be admitted, however, that the distance from New York to Cincinnati by the contemplated "Great Central" will be less than by the Richmond route, and the same may be said of the extension of the Baltimore and Ohio west of the river, should that ever occur. It is, however, extremely improbable that both of these lines will be extended through the interior of Ohio to Cincinnati, as they would be nearly parallel, and would come into ruinous competition with each other. But, on the other hand, it should be considered that the southern route between New York and Cincinnati and St. Louis, of which the great Virginia line will form the most important link, may be much shortened. When the railroad from Richmond to the head of the York river, authorized by an act of the last Legislature, shall have been made, and a road continued from its eastern termination on to some point near the mouth of the Rappahannock, the communication between Richmond and the Chesapeake will be much improved. Should this route be extended across the bay, and on in a line to the Delaware Breakwater, the distance would be much shortened between both New York and Philadelphia and Richmond. If this line should be continued from some point opposite the Breakwater, through the whole length of New Jersey to New York, the distance between the latter and Richmond would be still further reduced. By this means New York and Richmond would be brought into direct communication, and within twelve hours of each other. Thus the advantage of the "Great Central" in opening a communication between New York and St. Louis, over that of the great southern line, would become very inconsiderable in point of distance. That the increasing implications of business between the Empire City and Richmond, occasioned by opening the Richmond and Ohio Railroad, would justify the extension of this route, to facilitate the intercourse between the latter city and New York and Philadelphia, no reflecting

mind can doubt. The extension of the great Virginia line also from its western termination at Guyandotte on to Louisville, and thence to St. Louis, would reduce still more the distance between New York and St. Louis, and render the Virginia line as short, or nearly so, as the route by the "Great Central."

In any point of view, therefore, as a great channel of trade and travel connecting the West with New York, the Richmond and Ohio will not suffer in the comparison. Again, while the northern lines will be active and powerful competitors with the Richmond line for the trade originating around the lakes and north of the Ohio, the latter will have a decided advantage over them all for the business of the valley proper of the Ohio river, and for that arising south and south-west of it. This view, in connection with the other advantages already mentioned, and which are peculiar to the location of this route, gives it an importance which every intelligent man must appreciate. In other words, the rivalry of these great lines for the immense business of the West, will, in a great degree, be confined to the country lying north and west of the Ohio, while the Virginia road will offer the quickest and cheapest outlet for the whole country on the south and south-west of the Ohio. The business arising in the latter portion of the Union in making progress east and north, will encounter this line first, through which it will find at all seasons, an open channel to the Atlantic. Should this line be extended to Louisville, and thence to St. Louis, it will undoubtedly secure a majority of the southwestern trade.

But these considerations, conclusive as they may be to show the importance of the Richmond and Ohio Railroad, as a great line of communication between the east and west, relate rather to the advantages which New York and the northern and eastern cities would derive from it, and are not based on the assumption, that within the state of Virginia there will be created great commercial marts, which will powerfully attract the trade and travel of the Mississippi valley. We forget the important fact, that since the opening of this vast valley of the west, within the last twenty years new cities have sprung up, as if by magic, in what was before an unbroken wilderness, and that these cities are rapidly becoming centres of an immense trade, giving new directions to the course of business, and creating new currents, along which the wealth and commerce of the country are pouring in upon them. While these cities are thus rising into notice, why should not Richmond and Norfolk, situated upon tide waters, and with the shortest communication with the whole west, become great commercial marts, and the centres of an immense trade, both foreign and domestic?

Let us, therefore, examine what would be the probable effects of the Richmond and Ohio Railroad upon the general prosperity of the commonwealth, and upon our own eastern cities of Richmond and Norfolk.

To be continued.

# CHILLED CAST IRON WHEELS FOR RAILROADS.

**ANNEXED ARE LITHOGRAPHS OF CHILLED CAST IRON RAILROAD WHEELS,** to which I would call attention.

Having been extensively engaged, for 12 years past, in the manufacture of Chilled Wheels, both for Engines and Cars, I recommend them as a good article. The result of my long experience has pointed out various improvements in the form of Spoke, disposal of Metal in the Rim of Wheels, and the mixture of Iron in the Foundry; I feel confidence, therefore, in saying, that my wheels are, in every respect, equal to the best that are made in the country.

The Ring Wheel is a patent article, and from long experience has been found to be superior to every other description of chilled wheels. A Malleable Iron Ring is cast in the Body of each Wheel, which serves the purpose of Chilling much more perfectly, immediately over the Ring, and at the Joint of the Tread and Flanch, than can be done by any other mode. This part of a wheel is rarely well chilled without the use of the ring, and the severe action when in use at this particular point on a wheel, wears it most rapidly away, and renders them unfit for use, notwithstanding the other parts are well chilled. The wrought iron ring also secures the cast iron wheel against the liability of disaster from breakage.

I would call attention also to the Shape given each Spoke: they are formed on the same principle as the Tapered Axle, and relieve the Wheel from sudden shocks, by a proper distribution of the vibrations caused by such shocks, and which if allowed to centre at one point, soon break the wheel. The disposition of the metal in the rim is found, on long experience, to be the best for chilling.

The Chilled Driving Wheels, for Locomotive Engines, I can also recommend, as well on their own merits, as the fact that the demand for them has very materially increased during the past two years. The Baltimore and Ohio, Baltimore and Susquehanna, and Philadelphia, Wilmington and Baltimore Railroads use them entirely. These wheels have to recommend them—that they are much lighter than the cast iron wheels with wrought iron tires; their use entirely does away with the expense and trouble in the constant turning and refitting consequent upon the use of wrought iron tires, and their first cost is materially less than that of wrought iron tired wheels—the chilled wheels being about one-half, and their durability is double that of tired wheels.

These facts, together with the assurance of the Roads immediately around me, that engines which have had chilled drivers substituted for wrought iron tired wheels, evinced no want of tractive power, growing out of such a change, but performed their daily work with the same ease and with less trouble than heretofore, suggest the propriety of calling attention to them.

Wheels, with or without rings, of any particular stand of hub, or pattern, (when the order is such as to warrant the expense,) other than the drawings show, will be forwarded to order with despatch, either in the rough, or keyed and banded, or fitted on axles, as may be desired. I have on hand various other wheel patterns, not represented in Lithograph; these I send a sketch of as most used at present.

Railroad Work of all kinds I am extensively engaged in the manufacture of: Locomotives for Freight or Passenger Transportation, Iron Cars for Coal, Frame cars and Trucks, together with Stationary Engines and foundry work of all descriptions.

Address ROSS WINANS, Baltimore, Md.

## Railway Speed.

The Hampshire (England) Independent says that the express train on the Southwestern Railway is about to be still further accelerated. The regularity with which the journey has been hitherto performed has induced some experiments—and it is found that the whole distance between Southampton and London (nearly eighty miles) can be regularly and safely done in an hour and three-quarters. The evening train from Southampton to London—starting at seven o'clock, is about to be replaced on the Southwestern railway—giving increased accommodation in the summer months. It will leave probably at seven, and arrive in London at ten o'clock.

## ITEMS.

**Cheshire Railroad.**—The annual meeting of the stockholders in the Cheshire Railroad took place in Keene on Tuesday. The following gentlemen were elected directors: Thomas M. Edwards, Salma Hale, and Benjamin F. Adams, of Keene, Abel Phelps and Thomas Thatcher of Boston, Hiram Hosmer of Watertown, and Ephraim Murdock, Jr., of Winchendon. The directors' report was very satisfactory, showing steady progress and flattering prospects for the road. A resolution

was unanimously adopted to pay to persons holding stock fully paid, on the 1st of July next, interest on their assessments according to the date of the payments thereon. The Keene Sentinel states that it is believed the road will be opened to Winchendon, if not to Fitzwilliam, (twelve miles from Keene) by the 1st of August, and to Keene by the 1st of December.

**At a special meeting of the Eastern Railroad Company on Monday at Salem,** the contracts with the Portland, Saco and Portsmouth Railroad were sanctioned; the Company accepted the power to take stock in the Grand Junction Railroad Company, and authorized the Directors to make such arrangements with that company as might seem to them for the interest of the Eastern Railroad.

## Kennebec, Bath, and Portland Railroad.

—The ceremony of breaking ground upon the Kennebec, Bath, and Portland Railroad, says the Portland Advertiser, was performed at Bath on Wednesday last. There was a grand celebration on the occasion. A procession was formed, escorted by a volunteer

company, truckmen mounted, and cavalcade mounted, and proceeded through the principal streets of the town to the building, where a free collation was partaken of. The ceremony of breaking ground was performed by Capt. George F. Patten and Mr. McKeen, two of the directors, after which Mr. McKeen made a statement in relation to the affairs of the company, showing it to be in a very prosperous condition. Speeches were made by several gentlemen, and the whole affair passed off in the most agreeable manner.—*Boston Atlas.*

**The Bridge.**—The committee on railroads has reported favorably to the repeal of the bridge clause of the New York and Boston railroad charter. A dissenting report was made by Mr. Dewing. The majority report says that they had fully heard the parties by their counsel, and had duly considered the evidence introduced, and that in their judgment the interests to be promoted by the proposed road were not sufficiently important to justify a sacrifice of the vast and various interests dependent on the uninterrupted navigation of the Connecticut river. That in

1874-1875

their judgment a bridge such as the 17th section of the charter of that railroad authorizes would seriously obstruct the navigation of the river, and should not be erected. They therefore reported a resolution repeating that clause, and as a substitute therefor, giving the company power to erect a bridge at the narrows below Middletown, at a certain prescribed height above the channel of the river at low water mark, or to maintain a ferry at any point between Portland and Middletown.

Mr. Dewing's minority report rested on the ground that the whole matter had been well settled by the last legislature, and that no new reason had been given for revising it; that he was not satisfied that such a bridge would cause the obstructions apprehended; that whether it would or not could only be known by actual trial, and if on trial such an effect was produced, nobody would complain of the removal of the bridge. The committee consisted of one senator and eight representatives. The reports were made the order of the day on Friday.—*Hart. Courant.*

The northern railway of the Emperor Ferdinand was opened on the 7th of April, as far as Odensburg, in Prussian Silesia. It completes the largest line of railway projected in Germany, and unites Vienna, Berlin and Hamburg, three of the most important mercantile towns in the German confederation.

**Nashville and Chattanooga Railroad.**—We are informed, that on Friday evening the corporate authorities of Nashville passed an Act on its first reading, providing for the taking of the stock in the Nashville and Chattanooga Railroad to the amount of \$500,000. The friends of the road will now see that the enterprise must go ahead. We shall publish the official action of the board as soon as we are placed in possession of it.—*Tennessee Papers.*

## GUN-COTTON.

From the interest which attaches to authentic particulars of experiments with this new power, we are pleased to announce, that we shall be enabled to place before our readers reports of trials in all parts of the country, and from a source which will remove all doubt of accuracy in description or detail. Annexed is the first of a series of promised communications, which we shall publish as frequently as received.—*Mining Journal.*

Sir—I beg to enclose you my report in blasting gun-cotton against gunpowder, in the Greeston cutting, now making for the Syston and Peterborough Railway, near Stamford. The several experiments were conducted with every principle of fairness, in the presence of Mr. Grafton, Mr. Birnie, the resident engineer of that portion of the line, and several gentlemen living in the neighborhood.

I wish to remark, in placing these trials before you in a tabular form, that the cutting in which they were made, is through a hard freestone foundation; the entire depth of the cutting at this part is about 28 feet, the upper portion of which is composed of

clay and a loose rubble, under which lie beds of freestones varying in thickness. The thickness of the layer upon which these experiments were made, is about five feet. It was greatly to be regretted, that the character of the ground was such, as not to allow me to test the powers of gun-cotton on a more extensive scale: you will see that they are all small charges, still the results were most satisfactory to every person present; and none were more convinced of its superiority over gunpowder than the men engaged upon the work. The cubical quantity of the stone heaved and removed by the several explosions, was in many instances estimated by Mr. Birnie, the engineer present, who took a very lively interest in the matter, and who appeared highly gratified at the advantages derivable from the use of gun-cotton in all operations where blasting is essential.

These experiments show that the average powers of the patent gun-cotton in blasting, is proved to be in the proportion of one of gun-cotton to six of gunpowder; so that where six holes are necessary when powder is used, only one hole is necessary when the gun-cotton is substituted, whereby a great saving of time, labor, and expense in all blasting operations, whether in open cuttings, tunnels, or deep mines, is effected, and proves the invention of gun-cotton to be invaluable.

JOHN F. WHEELER.

Stamford Hotel, Stamford, April 21.

The above proportions of gunpowder and gun-cotton were tried in the Greeston cutting, near Stamford, being a part of the Syston and Peterborough line, now in progress.

\* Let to Western Railroad. † Let to Housatonic Railroad. ‡ Let to Fitchburg Railroad.

**Magnetic Telegraph in Virginia.**

The following bill was, we understand, passed by the Virginia Legislature, at its last session.

*Be it enacted by the General Assembly,* That the Richmond, Fredericksburg and Potomac railroad company, the Richmond and Petersburg railroad company, and the Petersburg railroad company, be and they are hereby authorized to construct and maintain along the line of their respective railroads, a Line of Morse's Electro Magnetic Telegraph, or any other Electric Telegraph, having first acquired the legal right to use the same, for their own use and that of the public, making reasonable charges on messages or intelligence transmitted thereby.

*Be it further enacted,* That it shall be lawful for Samuel F. R. Morse, and his associates, who have or may become owners of Morse's Electro Magnetic Telegraph, to put up and maintain a line of said Telegraph, or of any other Telegraph, having first acquired the legal right to use it, from Washington city through Fredericksburg, Richmond and Petersburg, to the limits of North Carolina, upon the ground of the said railroad companies as far as they extend, having first obtained the consent of those companies, making reasonable charges on messages or intelligence transmitted thereby; and they shall have the rights, powers and privileges of other corporate bodies, under the name and style of the "Washington and New Orleans Telegraph Company," for the purpose of building and managing said line of Telegraph.

*Be it further enacted,* That the inventors of any system of Telegraph whatsoever, or those who may have acquired a legal conveyance thereof, shall have a right to construct the same, for the accommodation of the people of this commonwealth, along the common roads, streets and public works, and over the waters thereof; *Provided,* that they shall not obstruct the ordinary use of such roads, streets public works and waters; *Provided,* also, that inventors who claim this privilege, and their assignees, shall first produce the proof of their inventions, or the legal conveyances under which they claim, to the Board of Public Works.

*Be it further enacted,* Any agent or agents employed in working any line of Telegraph constructed under the authority of this act, and any other person or persons who may be instrumental in conveying false intelligence thereby, with intent to defraud or injure any one, knowing the same to be false, or who may, from corrupt or improper motives, withhold or delay the transmission of messages or intelligence for which the customary charges have been paid or tendered—and any persons who shall wilfully injure, break or destroy any of the posts or wires of any such lines of Telegraph, shall be deemed guilty of a misdemeanor at common law, and shall be punished as for a misdemeanor.

**BACK VOLUMES OF THE RAILROAD JOURNAL** for sale at the office, No. 105 Chestnut street.

**PATENT RAILROAD, SHIP AND BOAT Spikes.** The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal Iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

••• Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

**MANUFACTURE OF PATENT WIRE** Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by JOHN A. ROEBLING, Civil Engineer, Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Ships, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition.

2v19 1v

**PATENT HAMMERED RAILROAD, SHIP and Boat Spikes.** The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed.

JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y. The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merritt, New York; J. H. Whitney, do.; E. J. Ewing, Philadelphia; Wm. E. Coffin & Co. Boston. ja45

**MACHINE WORKS OF ROGERS,** Ketchum & Grosvenor, Patterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR, 2v19 1v 445 Paterson, N. J., or 60 Wall street, N. York.

### FRENCH AND BAIRD'S PATENT SPARK ARRESTER.

**TO THOSE INTERESTED IN** Railroads, Railroad Directors and Managers are respectfully invited to examine an improved Spark-Arrester recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger & freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. M'Kee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckly & Drury, Boston, will be promptly executed. FRENCH & BAIRD.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

••• The letters in the figures refer to the article given in the Journal of June, 1844.

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, - MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

### THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.		
4,224 Timbers, 11 ft. long, 3 x 6 inches =	68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs., at 4½ cts. =		101 25
Workmanship free of patent charge =		600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.

Civil Engineer and Patentee.

No. 277 South Tenth St., Philadelphia.

### LAP—WELDED WROUGHT IRON TUBES

FOR

**TUBULAR BOILERS,**  
FROM 1 1-4 TO 6 INCHES DIAMETER,  
and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manufacture as those so extensively used in England, Scotland, France and Germany, for Locomotive, Marine and other Steam Engine Boilers.

THOMAS PROSSER,

Patentee.

1y25

98 Platt street, New York.

### RAILROAD IRON.

#### MOUNT SAVAGE IRON WORKS

THIS Company are prepared to execute orders for RAILROAD IRON, of any pattern, and equal in point of quality to any other manufactured.

Address J. M. HOWE,

Pres't. Mt. Savage Iron Works,

Dec. 25, 1y\*

Maryland.

ENGINEERS' AND SURVEYERS'  
INSTRUMENTS MADE BY  
EDMUND DRAPER,  
Surviving partner of  
STANCLIFFE & DRAPER.

No 23 Pear street,  
1y10 near Third,

below Walnut,  
Philadelphia.

road Depots, etc.

West Troy, May 12, 1847.

ANDREW MENELY.

1y\*21

**PIG AND BLOOM IRON.—THE SUBSCRIBERS** are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by

A. WRIGHT & NEPHEW,  
Vine St. Wharf, Philadelphia.

121f

**RAILROAD IRON.—THE "MONTGOMERY"** Iron Company, Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to

1y48

MURDOCK, LEAVITT & CO.,  
Agents.  
77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC CEMENT.** This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper-barrels, by JOHN W. LAWRENCE,

142 Front street, New York.

Orders for the above will be received and promptly attended to at this office.

32 1y

# RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER

ber having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

## ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—

for sale or imported to order by the subscriber. These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,  
75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.		Weight per fathom.	Diameter of iron.	
	INCH.	LES. OZ.	INCH.	LES. OZ.		LES.	INCH.	Tons.
11	4	13 5	10	24 -		50	15-16	20
13	3	9 3	8	16 -		27	11-16	13
14	3	6 11	7	12 8		17	9-16	10
15	2	5 2	6	9 4		13	1-3	7
16	2	4 3	6	8 8		10	7-16	7

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1y24

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors; and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLICOTT & ABBOTT.

Factory, 9th street, near Coates, cor. Melon st.  
Office, No. 3 North 5th street,  
1y25 Philadelphia, Pa.

## THE SUBSCRIBERS, AGENTS FOR

the sale of  
Codorus,  
Glendon,  
Spring Mill and  
Valley,  
Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

SAM'L KIMBER, & CO.,  
59 North Wharves,  
Jan. 14, 1846. [1y4] Philadelphia, Pa.

## RAILWAY IRON.—THE BEST QUALITY

of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by  
DAVIS, BROOKS & CO.,  
Jan. 2. [1lf] 68 Broad St., New York.

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed.] WILLIAM ROE, Supt of Power.  
I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed.] G. A. NICOLL,

Supt Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

Jersey City, November 4, 1845.

[Signed.] T. L. SMITH,

N. Jersey Railroad and Transp. Co.  
This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed.] JOHN LEACH,

Jamaica November 12, 1845.

1y19 Supt Motive Power.

## NICOLL'S PATENT SAFETY SWITCH

for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee  
G. A. NICOLLS,  
ja45 Reading, Pa.

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined H. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

THOMAS & EDMUND GEORGE,  
ja45 N. E. cor. 12th and Market sts., Philad., Pa.

**RAILROAD IRON.—THE SUBSCRIBER'S** New Rail Iron Mill at Phoenixville, Pa., is expected to be ready to go into operation by the 1st of September, and will be capable of turning out 30 to 40 tons or finished Rails per day. They are now prepared to receive orders to that extent, deliverable after the 1st of October next, for heavy rails of any pattern now in use, equal in quality and finish to best imported.

**PIG IRON.**—They are also receiving weekly 150 to 200 tons of No. 1 Phoenix Foundry Iron, well adapted for light castings.

REEVES, BUCK & CO.,

45 North Water St., Philadelphia,  
or by their Agent, ROBT. NICHOLS,  
79 Water St., New York.

## NORRIS' LOCOMOTIVE WORKS.

BUSH HILL, PHILADELPHIA, Pennsylvania.

**M**ANUFACTURE their Patent 6 Wheel Combined and 8 Wheel Locomotives of the following descriptions, viz:

Class	1,	15 inches Diameter of Cylinder,	× 20 inches Stroke.
"	2,	14	" " × 24 " "
"	3,	14½	" " × 20 " "
"	4,	12½	" " × 20 " "
"	5,	11½	" " × 20 " "
"	6,	10½	" " × 18 " "

With Wheels of any dimensions, with their Patent Arrangement for Variable Expansion. Castings of all kinds made to order: and they call attention to their Chilled Wheels, for the Trucks of Locomotives, Tenders and Cars.

NORRIS, BROTHERS.

**K**EARNEY FIRE BRICK. F. W. BRINLEY, Manufacturer, Perth Amboy, N. J. Guaranteed equal to any, either domestic or foreign. Any shape or size made to order. Terms, 4 mos. from delivery of brick on board. Refer to

25,000 to 30,000 made weekly. 35

**T**HE NEWCASTLE MANUFACTURING Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention. ANDREW C. GRAY, 245 President of the Newcastle Manuf. Co.

**R**AILROAD IRON AND LOCOMOTIVE Tyres imported to order and constantly on hand by A. & G. RALSTON 4 South Front St., Philadelphia. 28tf

**VALUABLE PROPERTY ON THE MILL Dam For Sale.** A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 68,497 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x32 ft. with lathes, work benches, Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, turnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45½ feet two stories high, with a shed part 45½x20 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 200 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to HENRY ANDREWS, 48 State st., or to CURTIS, LEAVENS & CO., 106 State st., Boston, or to A. & G. RALSTON & Co., Philadelphia. ja45

**T**WO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS

PASCAL IRON WORKS.

## WELDED WROUGHT IRON TUBES

From 4 inches to 4 in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T. L., and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by  
**MORRIS, TASKER & MORRIS.**  
Warehouse S. E. Corner of Third & Walnut Streets,  
**PHILADELPHIA.**

**T**WO LOCOMOTIVE AND MARINE ENGINE Boiler Builders. Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

**MORRIS TASKER & MORRIS,**  
Warehouse S. E. corner 3d and Walnut Sts., Philadelphia 11f

## PATENT INDESTRUCTIBLE WATER

Pipes. The subscribers continue to manufacture the above PIPES, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York.

J. BALL &amp; CO.

**SPRING STEEL FOR LOCOMOTIVES.**  
Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1½ to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,  
1y

**THE SUBSCRIBER IS PREPARED TO**  
execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip.  
1y10 New York.

**LOCOMOTIVE AND CAR AXLES.**  
The Subscribers are now prepared to receive orders for the well known and approved Reading Locomotive and Car Axles—drawn to any required pattern from Bloom Iron only. Address

SAM'L KIMBER & CO.,  
Willow Street Wharf,  
4tf Philadelphia, Pa.

**TO RAILROAD CONTRACTORS.—PAT-**  
erson and Ramapo Railroad.—Proposals will be received until the 30th day of June, inst., for the Grading, Masonry and Bridging that part of the Paterson and Ramapo Railroad, extending from the north side of the Passaic river to Ramapo, a distance of about 14 miles.

Maps, Profiles and Specifications may be found at the Engineer's Office, Paterson, where every necessary information will be given.  
2c25• J. W. ALLEN, Engineer.

**NOTICE TO CONTRACTORS.—ANDROS-**  
COGIN AND KENNEBEC RAILROAD. Proposals will be received at the Railroad Office, in Lewiston, until the 17th of June next, for the Grading and Masonry of the 1st Division of the Road, extending from the Atlantic and St. Lawrence Road in Danville, to Green centre, 14½ miles.

Also, separately, for the Masonry and Woodwork of the Bridges across the Great and Little Androscoggin Rivers, the Bridges to be constructed on Towne's plan.

Plans and Profiles will be ready for examination, and the route shown, on and after the 10th of June.

Satisfactory surities will be required of bidders unknown to the officers of the company.

The 2d Division, extending to Snow's Pond in Belgrade, 25 miles, will be ready for contract about the 25th of July; and the remainder of the road to Waterville, about the 20th of September.

HOBERT CLARK, Agent A. & K. R. R.  
EDWARD APPLETON, Engineer.  
Railroad Office, Lewiston, May 8, 1847. 4c21

**RAILROAD IRON.—THE NEW JERSEY**  
Iron Company, Boonton, N. J., are now making Railroad Bars, and are prepared to execute orders for any required pattern. Apply to

FULLER & BROWN, Agents,  
No. 139 Greenwich, corner of Cedar street.  
June 1, 1847. 10c1f

**RAILWAY IRON.—DAVIS, BROOKS**  
& Co., No. 68 Broad Street, have now in port on Ship-board, 900 Tons of the best English heavy H Rails, 60 lbs. to the lineal yard, which they offer for sale on favorable terms, also, about 6 to 700 Tons now on the way, to arrive shortly, of the same description of Rail.  
46tf

**A. & G. RALSTON & CO., NO. 4**  
South Front St., Philadelphia, Pa.

Have now on hand, for sale, Railroad Iron, viz: 180 tons 2½ x ½ inch Flat Punched Rails, 30 ft. long. 25 " 2½ x ½ " Flange Iron Rails. 75 " 1 x ½ " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fittings.  
11c

**NEW YORK AND ERIE RAILROAD LINE**  
SUMMER ARRANGEMENT. For passen-

gers, twice each way daily, (except Sunday,) leave New York from the foot of Duane St. at 7 o'clock, A. M. and at 4 o'clock, P. M. by steamboat, for Piermont, thence by cars, to Ramapo, Monroe, Chester, Goshen, Middletown, Otisville, and the intermediate stations.

The return trains for New York will leave Otisville at 6 30, A. M. and 4 15, P. M.; Middletown at 7 A. M. and 4 40, P. M.; Goshen at 7 22, A. M. and 5 3, P. M.; Chester at 7 35, A. M. and 5 18, P. M.

Fare between New York and Otisville, \$1 50; way-fare in proportion.

For Milk—Leave Otisville at 5½ o'clock, morning and evening.

For Freight—The barges "Samuel Marsh and "Henry Suydam, Jr." will leave New York (from the foot of Duane St.) at 5 o'clock, P. M. daily (except Sundays.)

No freight will be received in New York after 5 o'clock, P. M.

Freight for New York will be taken by the trains leaving Otisville at 10½ o'clock, A. M.; Middletown at 11½, A. M.; Goshen at 12½, P. M.; Chester at 1 o'clock, P. M., etc., etc.

For farther particulars, apply to J. F. CLARKSON, Agent, corner of Duane and West Sts., New York, or to S. S. POST, Superintendent Transportation, Piermont.

24tf H. C. SEYMOUR, Sup't.

**WESTERN RAILROAD.—ON AND AF-**  
ter Monday, April 5, 1847, the passenger trains will leave daily, Sundays excepted, as follows:

Boston at 8 a. m. and 4 p. m. for Albany.

Albany at 7 1-4 a. m. and 5 p. m. for Boston.

Springfield at 8 1-2 a. m. and 1 p. m. for Albany.

Springfield at 8 1-2 a. m. and 1 1-3 and 3 p. m. (or on arrival of the train from New York) for Boston.

Day line to New York, via Springfield.—The steamboat train leaves Boston at 6 a. m., and arrives in New York at 7 p. m., by the steamboats Traveler, New York, or Champion. Returning, leaves New York at 6 1-4 a. m., and arrives in Boston at 7 p. m.

Night line to New York.—Leaves Boston at 4 p. m., and arrives in New York at 5 a. m.

Albany and Troy.—Leave Boston at 8 a. m., Springfield at 1 p. m., and arrive in Albany at 6 p. m.; or, leave Boston at 4 p. m., Springfield next morning at 8 1-2, and arrive in Albany at 1 1-2 p. m.

The Troy trains connect at Greenbush.

The trains for Buffalo leave at 7½ a. m. and 7 p. m.

For Northampton, Greenfield, etc.—The trains of the Connecticut River Railroad leave Springfield at 8 1-4 a. m., 1 and 3 p. m., and passengers proceed directly on to Brattleboro', Windsor, Bellows Falls, Walpole, Hanover, Haverhill, etc.

For Hartford.—The trains leave Springfield on the arrival of the trains from Boston.

The trains of Pittsfield and North Adams Railroad leave Pittsfield on the arrival of the trains from Boston.

N. B.—No responsibility assumed for any baggage by the passenger trains, except for wearing apparel not exceeding the value of fifty dollars, unless by special agreement.

JAMES BARNES, Sup't and Eng'r.  
C. A. SEAD, Agent, 27 State street, Boston.

**BOSTON AND PROVIDENCE RAIL-**  
road. Passenger Notice. Summer Arrangement. On and after Monday, April 5, 1847, the Passenger Trains will run as follows:

Steamboat train via Stonington—Leaves Boston every day, except Sunday, at 5 o'clock p. m.

Accommodation Trains—leave Boston at 7 and 10½ a. m. and 4 p. m., and Providence at 7½ and 10½ a. m. and 4½ p. m.

Dedham trains, leave Boston at 8 a. m., 12½, 3½, 6½ and 9 p. m., Leave Dedham at 7 and 9½ a. m. and 2½, 5½ and 8 p. m.

Stoughton trains, leave Boston at 11½ a. m. and 5½ p. m. Leave Stoughton at 7 10 a. m. and 3½ p. m.

All baggage at the risk of the owners thereof.  
25tf W. RAYMOND LEE, Sup't.

**NEW YORK & HARLEM RAILROAD**  
CO.—Summer Arrangement.—On and after Tuesday, June 1st, 1847, the cars

will run as follows, until further notice. Up trains will leave the City Hall for—Yorkville, Harlem and Morrisana at 6, 8 and 11 a. m., 2, 2 30, 5 and 7 p. m.

For Morrisiana, Fordham, Williams' Bridge, Tuckahoe, Hart's Corner and White Plains, 7 and 10 a. m., 4 and 5 30 p. m.

For White Plains, Pleasantville, Newcastle, Mechanicsville and Croton Falls, 7 a. m. and 4 p. m.—Freight train at 1 p. m.

Returning to New York, will leave—Morrisiana and Harlem, 7, 8 20 and 9 a. m., 1, 3, 4 30, 6, 6 28 and 8 p. m.

Fordham, 8 08 and 9 15 a. m., 1 20 and 6 15 p. m.

Williams Bridge, 8 and 9 08 a. m., 1 10, 6 08 p. m.

Tuckahoe, 7 38 and 8 25 a. m., 12 55 and 5 52 p. m.

White Plains, 7 10 and 8 35 a. m., 12 50, 5 35 p. m.

Pleasantville, 8 15 a. m. and 5 15 p. m.

Newcastle, 8 a. m. and 5 p. m.

Mechanicsville, 7 48 a. m. and 4. 48 p. m.

Croton Falls, 7 30 a. m. and 4 30 p. m. Freight train at 10 a. m.

Freight train will leave 32d street for Croton Falls and intermediate places, 4 a. m. and City Hall 1 p. m.

Returning, leave Croton Falls 10 a. m. and 9½ p. m.

ON SUNDAYS, the trains will run as follows: Leave City Hall for Croton Falls, 7 a. m., 4 p. m.

Croton Falls for City Hall, 7 30 a. m., 4 30 p. m.

Leave City Hall for White Plains and intermediate places, 7 and 10 a. m. and 5 30 p. m.

White Plains for City Hall, 7 10 and 8 35 a. m., 12 30 and 5 35 p. m.

Extra trains will be run to Harlem, Fordham and Williams Bridge on Sunday, when the weather is fine.

The trains to and from Croton Falls will not stop on N. York island, except at Broome st. and 32d st.

A car will precede each train 10 minutes to take up passengers in the city.

Fare from New York to Croton Falls and Somers \$1, to Mechanicsville 87½c., to Newcastle 75c., to Pleasantville 62½c., to White Plains 50c. 25tf

**LONG ISLAND RAILROAD COMPANY.**  
Summer Arrangement. On and after Monday May 1st, trains will run as follows, except Sundays:

Leave—Brooklyn at 9 1-2 a. m. for Farmingdale, 1 1-2 p. m. for Greenport, at 4 p. m. for Farmingdale.

Leave Farmingdale at 7 a. m. for Brooklyn, 12 m. do., at 3 1-4 do. do.

Leave Greenport at 8 1-2 a. m. for Brooklyn.

Leave Jamaica at 8 a. m. for Brooklyn, at 1 p. m. do., at 4½ p. m. do.

On Saturdays, a train will leave Brooklyn for Yaphank, at 4 p. m. Leave Yaphank, on Mondays for Brooklyn at 5 1-2 a. m.

On and after May 15th, and until September 1st, 1847, a train will leave Jamaica at 7 a. m. for Brooklyn—leave Brooklyn at 6 p. m. for Jamaica, and will land and receive passengers at any place between Brooklyn and Jamaica.

On Sundays—leave Brooklyn at 8 1-2 a. m. for Farmingdale; leave Farmingdale at 4 p. m. for Brooklyn.

Freight Trains—leave Brooklyn at 10 a. m. for Greenport; leave Greenport at 12 m. for Brooklyn.

Baggage crates will be in readiness at the foot of Whitehall street, to receive baggage for the several trains, 30 minutes before the hour of starting from the Brooklyn side.

The steamer "Statesman," Captain Nash, leaves Greenport for Sag Harbor on the arrival of the Accommodation train from Brooklyn.

25tf DAVID S. IVES, Sup't.

**PATERSON RAILROAD**  
Summer Arrangement.

Commencing April 20th, 1847, the cars will leave

Paterson at New York at

8 o'clock a. m. 9½ o'clock a. m.

11½ o'clock a. m. 12 1-4 o'clock p. m.

4 o'clock p. m. 5½ o'clock p. m.

On Sunday,

8 o'clock a. m. 9½ o'clock a. m.

4 o'clock p. m. 5½ o'clock p. m.  
Office 75 Courtlandt St.

**BALTIMORE AND SUSQUEHANNA**

Railroad.—Reduction of Fare. Morning and Afternoon Trains between Baltimore and York.—The Passenger trains run daily, except Sunday, as follows:

Leaves Baltimore at.....	9 a.m. and 3½ p.m.
Arrives at.....	9 a.m. and 6¼ p.m.
Leaves York at.....	5 a.m. and 3 p.m.
Arrives at.....	12½ p.m. and 8 p.m.
Leaves York for Columbia at.....	1½ p.m. and 8 a.m.
Leaves Columbia for York at.....	8 a.m. and 2 p.m.

**PHILADELPHIA AND READING RAILROAD.—Passenger Train Arrangement for 1847.**

A Passenger Train will leave Philadelphia and Pottsville daily, except Sundays, at 9 o'clock A. M.

The Train from Philadelphia arrives at Reading at 12 18 M.

The Train from Pottsville arrives at Reading at 10 43 A. M.

Fares.	Miles.	No. 1.	No. 2.
Between Phila. and Pottsville, 92		\$3 50 and	\$3 00
" " Reading, 58		2 25 and	1 90
" " Pottsville " 34		1 40 and	1 20

Five minutes allowed at Reading; and three at other way stations.

Passenger Depot in Philadelphia corner of Broad and Vine streets.

**PHILADELPHIA, WILMINGTON & BALTIMORE RAILROAD.—1847.**

Summer Arrangement.

Philadelphia for Baltimore... 8 a.m. and 10 p.m.  
Baltimore for Philadelphia... 9 a.m. and 8 p.m.

Connecting with Mail Lines North, South & West.

On Sundays, only the 10 P. M. Lines run.

The Boat Lines, via Newcastle & Frenchtown R.R.  
Leave Philadelphia at 3½ p.m. } No line on Sun-  
Leave Baltimore at 3 p.m. } day.

Accommodation Trains between Philadelphia & Wilmington.—Philadelphia to Wilmington, 8 a.m., mail, 12½ p.m., 4 p.m., 7 p.m., 10 p.m. mail. Wilmington to Philadelphia, 7 a.m., 1 p.m., mail, 4½ p.m., 7 p.m., 12½ a.m., night mail.

J. R. TRIMBLE,  
Engineer and General Superintendent.

**CONNECTION BETWEEN THE BOSTON and Lowell and the Boston and Maine Railroads.**

On and after April 1st, 1847, passenger trains will run as follows, viz:

Leaving Lowell at 7, 11 1-4 a.m., and 2 1-2, 4 1-2, and 6 1-2 p.m., to connect at the junction in Wilmington with the eastward trains—at 7 a.m. and 2 1-2 p.m. with those to Portland; at 4 1-2 p.m. to Great Falls only, with a detention of 45 minutes at the junction, and at 11 1-4 a.m. and 6 1-2 p.m. to Haverhill only. Leaving the junction in Wilmington, for Lowell, at about 7 1-4 a.m. on arrival of the morning train from Haverhill; at about 9 a.m., on arrival of the morning trains from Great Falls. At about 11 3-4 a.m., on arrival of the morning train from Portland. At about 5 p.m. on arrival of the afternoon trains from Haverhill. At about 7 1-4 p.m. on arrival of the afternoon train from Portland.

WALDO HIGGINSON, Agent.

**NEW YORK AND PHILADELPHIA RAILROAD line—direct.**

Via Newark, New Brunswick, Princeton, Trenton, and Bristol. (Through in six hours.) Leaving New York daily from the foot of Liberty street.

Morning line..... 9 o'clock a.m.  
Mail pilot line..... 4 " p.m.

The lines proceed direct to Bristol without change of cars, and thence by the new steamer, "John Stevens," to Philadelphia.

**FARE BETWEEN NEW YORK & PHILA.**

First class cars..... \$4 00  
Second class cars..... 3 00

Passengers will procure their Tickets at the office foot of Liberty st., where a commodious steamboat will be in readiness with Baggage-crates on board.

Fifty pounds of baggage will be allowed to each passenger in this line, and passengers are expressly prohibited from taking anything as baggage but their wearing apparel, which will be at the risk of the owner.

Philadelphia Baggage-crates are conveyed from city to city, without being opened by the way. Each train is provided with a car, in which are apartments and dressing rooms expressly for ladies' use.

Returning, the lines leave Philadelphia from the foot of Walnut st. at 9 a.m. and 4 1-2 p.m.

The lines for Baltimore leave Philadelphia daily, except Sundays, at 8 a.m., 3½ and 10 p.m., and Sundays only at 10 p.m.—being a continuation of the line from New York.

254f

**LITTLE MIAMI RAILROAD.—OPEN TO SPRINGFIELD—Distance 64 miles—**

connecting at Xenia and Springfield with Messrs. Neil, Moore, & Co's. daily daylight lines of stages going east and north, to Columbus, Zanesville, Wheeling, Cleveland, and Sandusky City, via Urbana, Bellefontaine, Kenton, and the Mad river and lake Erie railroad, or Columbus, Delaware, and the Mansfield and Sandusky City railroad—forming, by these connections, the cheapest and most expeditious route to Buffalo, Niagara Falls, Rochester, Albany, New York, and Boston.

On and after Thursday, August 13, 1846, until further notice, a Passenger train will run as follows: Leave Cincinnati daily at 9 A. M., for Milford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Old Town, Yellow Springs, and Springfield.

Returning, will leave Springfield at 4 hours 35 minutes A. M. A line of Hacks runs in connection with the Cars, between Deerfield and Lebanon.

FARE—From Cincinnati to Lebanon..... \$1 00  
" " " Xenia..... 1 50  
" " " Springfield... 2 00  
" " " Columbus... 4 00  
" " " Sandusky city 8 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company, on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at of a passage for every \$500 in value over that amount.

The 1½ P. M. train from Cincinnati, and the 2 40 P. M. train from Xenia, will be discontinued on and after Monday, the 10th instant.

A freight train will run daily.

474f W. H. CLEMENT, Sup't.

**BALTIMORE AND OHIO RAILROAD.**

MAIN STEM. The Train carrying the Great Western Mail leaves Bal-

timore every morning at 7½ and Cumberland at 8 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburgh and Hancock, connecting daily each way with the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Piusburg. Time of arrival at both Cumberland and Baltimore 5½ P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pittsburgh \$10, and time about 39 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$12. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

**WASHINGTON BRANCH.**

Daily trains at 9 A. M. and 5 P. M. and 12 at night from Baltimore and at 6 A. M. and 5½ P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. 313y1

**LEXINGTON AND OHIO RAILROAD.**

Trains leave Lexington for Frankfort daily, at 5 o'clock a.m., and 2 p.m.

Trains leave Frankfort for Lexington daily, at 8 o'clock a.m. and 2 p.m. Distance, 28 miles. Fare \$1 25.

On Sunday but one train, 5 o'clock a.m. from Lexington, and 2 o'clock p.m. from Frankfort.

The winter arrangement (after 15th September to 15th March) is 6 o'clock a.m. from Lexington, and ma. 9, from Frankfort, other hours as above. 351y

**CENTRAL AND MACON AND WESTERN** Railroads, Ga.—These Roads with the Western and Atlantic Railroad of the State of Georgia, form a continuous line from Savannah to Oothcaloga, Ga., of 371 miles, viz:

Savannah to Macon—Central Railroad ..... 190  
Macon to Atlanta—Macon and Western ..... 101  
Atlanta to Oothcaloga—Western and Atlantic... 80

Goods will be carried from Savannah to Atlanta and Oothcaloga, at the following rates, viz:

	To Atlanta.	To Oothcaloga.
On Weight Goods—Sugar, Coffee, Liquor, Bagging, Rope, Butter, Cheese, Tobacco, Leather, Hides, Cotton Yarns, Copper, Tin, Bar & Sheet Iron, Hollow Ware & Castings.....	\$0 50	\$0 75
Flour, Rice, Bacon in Casks or boxes, Pork, Beef, Fish, Lard, Tallow, Beeswax, Mill Gearing, Pig Iron and Grind Stones.....	0 50	0 62½
On Measurement Goods—Boxes of Hats, Bonnets and Furniture, per cubic foot.....	0 20	0 26
Boxes and Bales of Dry Goods, Saddlery, Glass, Paints, Drugs and Confectionary, per cubic foot.....	0 20	pr. 100 lbs. 35
Crockery, per cubic foot.....	0 15	" " 35
Molasses and Oil, per hhd., (smaller casks in proportion).	9 00	12 50
Ploughs, (large,) Cultivators, Corn Shellers, and Straw Cutters, each.....	1 25	1 50
Ploughs, (small,) and Wheelbarrows.....	0 80	1 05
Salt, per Liverpool Sack.....	0 70	0 95
Passage—Savannah to Atlanta, \$10; Children, under 12 years of age, half price, Savannah to Macon, \$7.		

Goods consigned to the subscriber will be forwarded free of Commissions.

Freight may be paid at Savannah, Atlanta or Oothcaloga.

F. WINTER, Forwarding Agent, C. R. R.  
Savannah, Aug. 15th, 1846. 1y34

**CENTRAL RAILROAD—FROM SAVANNAH** to Macon. Distance 190 miles.

This Road is open for the transportation of Passengers and Freight. Rates of Passage, \$9 00. Freight—On weight goods generally... 50 cts. per hundred. On measurement goods... 13 cts. per cubic ft. On brls. wet (except molasses and oil).....\$1 50 per barrel. On brls. dry (except lime)... 80 cts. per barrel. On iron in pigs or bars, castings for mills, and unboxed machinery..... 40 cts. per hundred. On hhd. and pipes of liquor, not over 120 gallons.....\$5 00 per hhd. On molasses and oil.....\$6 00 per hhd. Goods addressed to F. WINTER, Agent, forwarded free of commission. THOMAS PURSE, y40 Gen'l. Sup't. Transportation.

**SOUTH CAROLINA RAILROAD.**—A Passenger Train runs daily from Charleston,

on the arrival of the boats from Wilmington, N. C., in connection with trains on the Georgia, and Western and Atlantic Railroads—and by stage lines and steamers connects with the Montgomery and West Point, and the Tusculumbia Railroad in N. Alabama. Fare through from Charleston to Montgomery daily.....\$26 50 Fare through from Charleston to Huntsville, Decatur and Tusculumbia..... 22 00

The South Carolina Railroad Co. engage to receive merchandize consigned to their order, and to forward the same to any point on their road; and to be different stations on the Georgia and Western and Atlantic railroad; and to Montgomery, Ala., by the West Point and Montgomery Railroad.

JOHN KING, Jr, Agent. 1y95

**GEORGIA RAILROAD. FROM AUGUSTA TO ATLANTA—171 MILES.**

AND WESTERN AND ATLANTIC RAILROAD FROM ATLANTA TO OOTHCALOGA, 80 MILES.

This Road in connection with the South Carolina Railroad and Western and Atlantic Railroad now forms a continuous line, 388 miles in length, from Charleston to Oothcaloga on the Oostenaula River, in Cass Co., Georgia.

RATES OF FREIGHT.		Between Augusta and Oothcaloga and Dalton.	Between Charleston, Oothcaloga and Dalton.
		260 miles.	386 miles.
1st class.	Boxes of Hats, Bonnets, and Furniture, per cubic foot.....	\$0 16	\$0 26

German or other emigrants, in lots of 20 or more, will be carried over the above roads at 2 cents per mile.

Goods consigned to S. C. Railroad Co. will be forwarded free of commissions. Freight may be paid at Augusta, Atlanta, or Oothcaloga.

J. EDGAR THOMSON,  
Ch. Eng. and Gen. Agent.  
Augusta, Sept. 2d, 1846. \*44 1y

**GREAT SOUTHERN MAIL LINE! VIA** Washington city, Richmond, Petersburg, Weldon and Charleston, S. C., direct to New Orleans. The only Line which carries the Great Southern Mail, and Twenty-four Hours in advance of Bay Line, leaving Baltimore same day.

Passengers leaving New York at 4½ P.M., Philadelphia at 10 P.M., and Baltimore at 6½ A.M., proceed without delay at any point, by this line, reaching Richmond in eleven, Petersburg in thirteen and a half hours, and Charleston, S. C., in two days from Baltimore.

Fare from Baltimore to Charleston.....\$21 00

" " " Richmond..... 6 60  
For Tickets, or further information, apply at the Southern Ticket Office, adjoining the Washington Railroad Office, Pratt street, Baltimore, to STOCOTON & FALLS, Agents. 1y14

**THE WESTERN AND ATLANTIC** Railroad.—This Road is now in operation to Oothcaloga, a distance of 80 miles, and connects daily (Sundays excepted) with the Georgia Railroad.

From Kingston, on this road, there is a tri-weekly line of stages, which leave on the arrival of the cars on Tuesday, Thursday and Saturday, for Warrenton, Huntsville, Decatur and Tusculumbia, Alabama, and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga for Chattanooga, Jasper, Murfreesborough, Knoxville and Nashville, Tennessee.

This is the most expeditious route from the east to any of these places.

CHAS. F. M. GARNETT,  
Chief Engineer.  
Atlanta, Georgia, April 16th, 1846. 1y1

## FRANKLIN HOUSE,

No. 103 Chestnut Street, Philadelphia.  
The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the Franklin House, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,  
D. K. MINOR.

## BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

## ENGINEERS and MACHINISTS.

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,  
105 Chestnut Street,  
PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS.—Five Dollars a year, in advance.

## AMERICAN RAILROAD JOURNAL.

PUBLISHED AT 105 CHESTNUT ST. PHILADELPHIA.

Saturday, June 26, 1847.

Will Subscribers to the Journal—who have not *already done so*—please remit by mail the amount due? The amount to each is a trifle—but to us, in the aggregate—a very important matter, and an early remittance from each will greatly aid and oblige us.

CONTRACTORS will find the following a "Notice," of interest to them, and we hope they will avail themselves of it to their profit.

**MICHIGAN CENTRAL RAILROAD.—NOTICE TO CONTRACTORS.**—Proposals will be received by the Subscriber until the 1st of August next, for the Grading of that portion of the Michigan Central Railroad lying between Antwerp and New Buffalo, a distance of 60 miles.

Profiles and specifications will be ready for examination after the 15th day of July next, at the office of the subscriber, or that of Col. J. M. Berrien, at Kalamazoo, at which time the line will be shown to contractors.

J. W. BROOKS, Supt.  
Michigan Central Railroad Office,  
6226 Detroit, June 17, 1847. }

## To Contractors.—Pennsylvania Railroad.

We would call the attention of Contractors to the following advertisement of the Central Pennsylvania Railroad. This is a work of an extent and importance that renders this notice well worthy the attention of enterprising contractors in every part of the country; and we shall be disappointed if the competition is not spirited and profitable to the company.

**NOTICE TO CONTRACTORS.—SEALED** Proposals will be received until Wednesday, July 15th, in the Borough of Harrisburg, and until Wednesday, July 23d, in the city of Pittsburg, at 10 o'clock A.M., at the Office of the Engineers, for the Grading and Masonry upon fifteen miles of the Pennsylvania Railroad, extending west from Harrisburg, and fifteen miles of said Railroad, extending east from Pittsburg. The grading will include

very heavy work, and the amount of Masonry, including the Piers of Abutments of the Bridges across the Susquehanna, three-quarters of a mile in length, will be unusually large. Plans and specifications of the work can be seen at the Engineer's office in each place, for ten days previous to the time appointed for receiving the bids. Any further information can be had upon application to the Chief or Associate Engineers.

S. V. MERRICK, President.

## Railroads to the Lackawana Coal Region.

As the demand for anthracite coal increases, new avenues will be required to get it to market. In twenty-six years the amount of anthracite coal sent to market has increased from 345 tons—or from *one ton per day*, to two million seventy-seven thousand, two hundred and eighty tons, or 5,700 tons per day, and still the use of this kind of fuel has but just commenced, therefore it is necessary that timely arrangements should be made to ensure a regular and constant supply for the rapidly increasing demand, and especially for the supply of those regions where it is not yet introduced.

The early construction of the New York and Erie Railroad, together with the Lackawana Railroad, connecting the former with the coal region, will open a medium of reaching the interior of New York at Utica, Syracuse, and westward, as well as another outlet to the Hudson river and eastward of it.

The following statement in relation to the importance and value of this proposed work has been furnished us by a gentleman perfectly familiar with the Lackawana coal region, and the means of supplying the demand for coal in this country, in whose opinions we have great confidence, therefore we give it a prominent place in the Journal, and ask for it the favorable consideration of all who are interested in the subject.

## The Lackawana Railroad Company.

This company was chartered many years ago under provisions of the most salutary character, by the Governor of Pennsylvania, agreeably to an act of the Legislature of that State.

Hitherto, from the state of the money market, and a want of connection with other channels of communication, nothing has been done—except to procure its charter and organize the company, and to obtain such legislation from time to time, as to make improvements on the original act.

As it now stands it has nearly ten years to commence its operations, its duration is unlimited, and it connects with the New York and Erie railroad at Lanesboro, its northern terminus.

Under these favorable circumstances it presents to capitalists one of the most feasible projects for the investment of funds that we know of.

It would be a waste of time to give an elaborate statement of the Lackawana coal region, the excellence of its anthracite, or its inexhaustible quantity. These facts are too well known to require elucidation.

The Delaware and Hudson canal company have established the reputation of the Lackawana coal valley. Carbondale is as well known as Pottsville or Mauch Chunk. This prosperous company last year carried to market 318,000 tons of coal, and will carry this year 400,000 tons. Its clear profits last year were over twenty per cent. on the capital paid in, and the value of its stock in market is 180 per cent.

The Lackawana railroad company has a choice of as valuable coal lands as those owned by the Delaware and Hudson company, and in every particular can be as well calculated for the command of an extensive trade in coal as that company. Skillfully directed, and with a like attention to economy, no good reason can be assigned why its financial operations will not be equally prosperous and productive.

It has the privilege of holding two thousand acres of coal lands, a privilege which is inestimable, inasmuch as no efforts of late years have been able to obtain it—the present Governor of Pennsylvania having vetoed every bill that embraced the "coal clause."

In some points the Lackawana railroad will have the advantage over the Delaware and Hudson company. The former can reach the market by railroad communication alone, and with *uniformity of gauge*. Cars, loaded at the mines, may deposit their freight in the market, saving transhipment and waste—while the latter is compelled to discharge its coal at Honesdale from cars into boats, and at Rondout from boats into barges.

A continuous railroad has an advantage over any work composed of railroad and canal—the first may be used to advantage the whole year, the latter is impeded by frost and snow. Even in regard to expense of transportation, the Reading railroad carries coal as cheap as the Schuylkill navigation, and the Boston and Albany road has carried flour 20 per ct. cheaper than the Erie canal.

The Lackawana railroad has two leading objects in view.

Judson railroad company, that the within report has been prepared by him from the books of the said company, and is correct to the best of his knowledge and belief.

EZRA FOSTER, JR.

Sworn to before me this 2d day of February, 1847.

H. Q. LANSING,  
Commissioner of Deeds.

#### Richmond and Ohio Railroad.

Continued from page 391.

In order to arrive at just conclusions upon this important subject, we may safely examine the influences of similar works upon other States of the Union, and yet even in this view there are some weighty considerations affecting the present condition of Virginia, which will conspire to give her a more rapid, onward career, when once she becomes enlisted in works of internal improvements.

Twenty years ago, when the Northern States entered upon their work of opening artificial channels of communication with the west, the mighty sources of that wonderful region were entirely undeveloped: scarcely a bushel of grain, not a barrel of flour or pork, was ready for transportation to an eastern market. There was then, indeed, the same illimitable valley of unsurpassing fertility spread out to the view of those who entered as pioneers upon this grand enterprise. But they were regarded as enthusiasts, and their predictions of the future greatness of that vast valley considered as idle dreams. While Massachusetts, New York, Pennsylvania, and Maryland have been making rapid advances in wealth and commerce, the State of Virginia has remained nearly stationary. And now, as she is about to enter upon a career of internal improvements, the broad west is already occupied by millions of inhabitants, and their surplus productions are losing half their value for the want of greater facilities to eastern markets. In 1843, their productions amounted to the vast sum of \$220,000,000, and at the present time exceed \$300,000,000. This immense valley, containing an area of 1,211,000 square miles, of the most fertile land on the globe, and a capacity to sustain 100,000,000 inhabitants, will tax all "the outlets to the Atlantic which have been or can be opened to their utmost capacity for the exportation of its surplus produce and the importation of its merchandise. Shall Virginia, then, falter in this great enterprise? Occupying, as she does, a central position in the Republic—with her broad Chesapeake indenting her eastern limits, with excellent harbors, with all the natural elements of greatness in abundance, and with this great central trunk opening into the Ohio, and there connecting with more than 20,000 miles of internal communication, webbing over the whole west—shall she not relieve herself from colonial dependence upon her more enterprising neighbors, and build up within her own border one or more great commercial towns? In accomplishing this great design, she has only to open this central channel, and the vast tide of business already accumulated upon her western borders, will flow through her territory at all seasons of the year. That this grand railway would be the most natural outlet for the Ohio valley below Guyandotte,

or even the Great Kanawha, and for the valleys of the Missouri and the Upper Mississippi, in so far as their productions would seek the northern and eastern markets, will scarcely admit of a doubt. As has been before observed, the mouth of the Chesapeake is the most commanding site on the Atlantic coast for a great commercial centre, and it cannot be necessary to labor the argument that the opening of this great work would be a brilliant era in the history of the Commonwealth. In this connection it may be well to glance at the effects of similar improvements in other states. In adverting to New York, we cannot do better than to adopt the language of an able article in Hunt's Merchants' Magazine, vol. 13, page 54: "The region throughout the entire line of the canal, was indeed advanced in value to a great extent, through the agency of this great work. Furnishing a direct line of communication to the great metropolis of the country, the city of New York, it brought the agricultural resources of that region of country into a most valuable market, and at the same time furnished a cheap and safe line of transportation from the Atlantic seaboard to the populous towns and thriving settlements which were beginning to spring up throughout the west. Villages also began to arise along the line of the canal; and became the depots of rapidly increasing and prosperous trade, that portion of the interior of New York which had before spread out tracts of unsettled wilderness was gradually subdued to agricultural industry, as the motives for cultivation increased, by the opening of lines of transportation to new markets."

The value of the improved lands of New York in 1825, on the completion of the Erie Canal, was \$174,024,175. In 1835, ten years thereafter, that value had arisen to \$241,385,050, exhibiting an income in value of \$72,361,475.

The increase of the city of New York in commerce was even more rapid.

In 1827 the duties on imports paid in New York, were about 67 per cent, and in 1833 about 82 per cent. of the total paid in the United States. In 1825 the grand total tonnage which entered and cleared from the port of New York from and to foreign ports, was 543,616. In 1835 the same was 834,056, showing an income of tonnage in ten years of 290,444.

In 1825 the population of New York was 166,086.

In 1835 the city numbered 270,089, having increased 104,003 in ten years.

In 1825 the total valuation of real and personal estate in the city was \$101,160,046. In 1835 the same was \$218,723,703. In 1844 it was \$235,960,047. Increase in ten years, \$117,663,637. In 14 years, \$134,800,001. That her system of canals and railroads mainly produced these results, is beyond question. In Massachusetts the proofs are no less convincing. In 1830 the total valuation of real and personal estate in the city of Boston, was as follows: Real estate, \$36,960,000. Personal estate, \$22,626,000. Total, \$59,586,000. In 1840,

real estate \$60,424,200. Personal estate, \$34,157,400. Total, \$94,581,600. In 1845, real estate, \$81,991,400. Personal, \$53,357,300. Total \$135,348,700. Increase in fifteen years, \$76,362,700!! There is a remarkable fact connected with the valuation of estate in New York and Boston. During a part of the period from 1841 to 1844, while New York was reposing securely on her natural advantages and her magnificent system of canals, her more vigilant rival, bending all her efforts in extending her railroad system, made such an inroad upon the prosperity of New York, that during these three years, her real and personal property actually diminished in value \$15,234,873, while that of Boston increased \$20,343,700. This is a most convincing argument in favor of the superiority of railroads over canals in promoting the prosperity of commercial cities.

In 1830 the population of Boston was 43,298. In 1840 it was 93,383, and at this time is probably not less than 120,000.

But this does not, in fact, exhibit the real increase of her population which may be fairly attributed to her grand system of railroads.

Lowell and other prosperous cities in her immediate vicinity have been built up mainly by the capital and enterprise of Boston. Indeed the whole state has felt the beneficial effects of her railroads, and sustains at this time a most honorable rank in commerce, wealth, and refinement in the Union. With such an example before the people of Virginia, they cannot remain indifferent to their duty to the Commonwealth.

That Massachusetts, with a territory about one-ninth as large as Virginia, and in natural fertility so far inferior, should yet so far exceed her in commerce, enterprise, and comparative wealth, is too humiliating to the pride of the Old Dominion.

In relation to Pennsylvania, the committee would adopt the language of an able writer in Hunt's Merchant's Magazine, Vol. 13, page 138. "The credit of the public works has concurred with the credit of the state, and the voice of opposition and complaint has been drowned by the music of the boatman's horn on the canals, and hushed into silence by the rumbling of the wheels of thousands of cars upon our railways—the sound of forge hammers—the rattling of rolling mills—the roar of furnaces—and the puffing of steam engines in every section of the Commonwealth. If these state works had never yielded any revenue over the annual expenses, the people of Pennsylvania would still have been gainers by their construction at the public expense. They are enduring monuments of honor to those who planned them; and by their energy effected their completion. The permanent value they have given to property—the vast resources they are the cause of developing—the capital and population which they are bringing into the state—the enterprise awakened and dormant energies aroused. The increased price of every thing sent to market, and the amount saved in the reduced price of every thing purchased from the sea board,

are worth many times more to the whole people than the amount of state taxes, required to pay the interest on their cost."

Statistical arguments might be multiplied to show the wonderful influence of great lines of internal improvements upon the wealth, population, and commercial prosperity of Baltimore and Charleston. But it is deemed superfluous to pursue this subject further. Enough has been shown to justify the argument that the construction of the Richmond and Ohio Railroad would open a new era in the history of her sister states. "In her central position in the Union—in her mild and delightful climate—in her noble Chesapeake and majestic rivers—in her inexhaustible resources of mineral wealth, and her great manufacturing advantages, no state in the Union possesses so many of the elements of greatness and power as Virginia. These elements, however, can only be made subservient to her prosperity by the union of her whole people; and nothing will so strongly cement them in feeling and interest as the construction of this great work. Again, the geographical features of Virginia are such that this great work would cut her valleys at right angles, through which, by means of lateral roads easily constructed, the wealth and resources of the whole interior would naturally flow, diffusing, by means of this central trunk, life and energy through every part of the state." [See *Hunt's Mer. Mag.*, vol. 13, page 462.]

It may be proper here to advert to several facts and arguments, to show the peculiar advantages of this great central railway through Virginia for the trade and travel of the west; for, however great may be the internal trade of the several states, which have already entered the lists as competitors in the noble enterprise of internal improvements, it is evident that the business of this wonderful region is the grand prize for which they are all contending. In the first place, it is an important fact in the commercial statistics of New Orleans, that setting aside her great staples, cotton and sugar, much the greater portion of the interior trade comes down from the upper country, in the winter season. It is moreover true, that nearly one-half of her exports of country produce is derived from Cincinnati alone. The inference in these facts is clear, not only that Cincinnati is the great centre from which New Orleans draws a large proportion of her trade, and that this trade flows down the river, while the northern outlets are obstructed with ice and snow; but also, that if an outlet were opened from Cincinnati, free from these obstructions, and affording a more desirable transit for her produce to tide waters, a large portion of the trade which now goes to New Orleans from Cincinnati would take an eastern direction. It cannot be doubted that the Richmond and Ohio Railroad would soon become such an outlet, and the most powerful competitor with New Orleans for the trade of the west. Richmond and Norfolk would be safer ports for the storage and transshipment of western produce to all foreign ports, than New Orleans.

"The climate and high charges of New Orleans, and the injury done to articles liable to damage from heat, both at that place and in their transit through the gulf, constitute other strong grounds of preference in favor of an eastern route." [See *Sup. Rep. Jas. R. K. Co.*, for 1846, page 646.]

"It is our opinion that the following articles would pay all the expenses of transportation named by you, and would net the grower more in Richmond than if taken to New Orleans free of charge, say tobacco, flour, pork, bacon, lard, butter, cheese, etc., for the following reasons. Independent of freight down the river to New Orleans, these articles are all materially injured by passing through a warm and humid climate. At New Orleans they have to pay exorbitant rates of drayage, storage, fire insurance and commission, and when shipped from thence to other markets, are subject to a rate of freight at times 50 per cent. higher than from James River." (*Idem*, page 647.) Such is the opinion of merchants of high responsibility in the city of Richmond. For these substantial reasons it is certain that a vast proportion of the trade of New Orleans derived from the "Father of waters," would be directed to our own Atlantic cities through this great central line. It is pertinent to this view of the case to notice the fact, that the whole extent of the interior navigation afforded by the Mississippi and its numerous tributaries, is estimated at 20,000 miles. Of this probably two-thirds lie above the Ohio River, and the business arising in that vast country would strongly tend to the Atlantic markets, and come, therefore, more or less under the influence of the Virginia line. And this view is more important from the fact, that this immense extent of water communication opens up into a broad extent of country, whose great staples, for the reasons above stated, will most naturally seek the northern and eastern markets in preference to New Orleans. In the next place it is worthy of remark in this connection, as showing the advantages of this line over its northern rivals as a great outlet for the products of the west, that a vast amount of these products are exported to the West Indies and South America, as well as to Europe, and that this export trade will probably increase to an extent of which at present no one can form any conception.

Now then, if this great thoroughfare were opened, so as to give assurance of a quick and cheap transit at all seasons of the year for the products of the west, vast quantities which are now sent to the lake ports would be collected at St. Louis and Cincinnati, and transported over the Virginia line. That this would be the case in an eminent degree, so far as the Queen City is concerned, cannot be doubted. She is already the centre of an immense produce business, and must become more and more the business centre of the rich agricultural country around her. For the outlet of her immense traffic in grain, flour, pork, and other staples of the west, the Richmond and Ohio Railroad would open the most desirable channel to tide water. To

aid in the estimation of the importance of this export business of the west, let us look for a moment at some statistical facts. On reference again to the same excellent work, *Hunt's Merchants' Magazine*, vol. 13, page 376, a valuable table will be found, which shows that for the year ending June 30, 1844, the total exports from the United States to other American nations, amounted to \$20,892,682; of this amount only \$1,202,418 was cotton, and \$44,678 was sugar—in all \$1,247,096 of the products of the south, leaving \$10,645,586 of produce from the northern and western portions of the Republic. This amount, though large, is but "a drop of the bucket" compared with what may soon be expected from the almost unlimited extent and amazing productiveness of the great valley of the west. Now then, since, as has been before observed, the Chesapeake offers the most feasible point as a great commercial centre for the west, the conclusion is irresistible, that when this great line shall have been opened, a vast proportion of this export trade of the west must seek an outlet through it to Richmond and Norfolk. And especially would that portion of this rapidly increasing trade which would spring up with the South American nations and the West Indies, flow through this channel from Cincinnati, rather than make the more circuitous and expensive routes through any of the more northern cities. Large quantities of flour would seek this outlet for foreign markets, as it would be exported from Richmond in better condition than from New Orleans, and also much earlier in the spring and later in the autumn than from the northern market. Immense quantities of wheat from Ohio, Indiana, and Illinois would be sent to Richmond, to be there manufactured for the foreign market. This export trade of western produce would of itself build up Richmond and Norfolk, and give them the rank of great commercial cities. This opinion is corroborated by that of Mr. Roebling. "This road," says he, "will form the most direct route to Cincinnati, and if extended to Norfolk, may raise the latter place to one of the first seaports on the Atlantic coast."

Indeed, who could doubt that if Richmond and Norfolk were now cities, each containing 40,000 inhabitants, they would at once, with the Richmond and Ohio Railroad opening to the granaries of the west, become powerful competitors with New York, Boston, Philadelphia and Baltimore, for the western trade, and who can entertain a doubt, that this great road being opened, they would soon contain that population?

On recurring to the population of Boston hereinbefore stated, it will be seen, that if Richmond should increase in the same ratio with that city, allowing Richmond at this time 25,000 inhabitants, in ten years she would contain in round numbers 54,000. Again, assuming New York as a basis, and giving to Richmond the same rate of increase, her population in ten years would be 41,000. Considering the advantages of Richmond for manufacturing purposes, and the vast influx of business which this great channel would

occasion, it is highly probable that her increase of population would even be in a greater ratio than that of New York and Boston. Taking all things into consideration, no city in the United States combines so many advantages as Richmond would possess upon the completion of this improvement. With the grand falls of James River on the one hand, and the tide water upon the other, and with the increasing tide of business pouring into her lap from the west, bringing to her the raw material and carrying west her fabrics, she could not fail of accomplishing her high destiny. In this connection it is worthy of consideration that New Orleans can never become a great manufacturing city, and this advantage of Richmond, super-added to the other attractions of this Virginia line, could not fail to draw largely upon the western business, and rapidly accelerate the wealth and prosperity of Richmond. "In time also of war with any European power, this railway would be of the highest importance as a great military road."

No other line of intercommunication could be so secure and central between the Atlantic cities and the Mississippi valley. Lying wholly within our own territory and passing through the geographical centre of the states east of the Mississippi, its eastern terminus would connect with the Chesapeake the safest and best harbor for our fleets. Its western terminus would open into the great agricultural regions of the west, where abundant naval and military stores could be obtained at all seasons of the year—and our armies and munitions of war transported each way with perfect security." *Hunt's Mer. Mag.*, vol. 15, page 276.

In addition to all these general considerations, showing the importance of the Richmond and Ohio Railroad, and its relative advantages as compared with the great rival lines of the country which stretch across the Alleghenies, it is proposed briefly to refer to other subjects more immediately connected with its influence, affecting the internal prosperity of the commonwealth. In doing this, for the sake of avoiding confusion, it may be well to consider the influence of this great central railway as follows: 1st. Its general effect upon the real and personal estate of the commonwealth. 2nd. Upon the products of the forest. 3rd. Upon the products of the mines. 4th. Upon the products of the field, and 5th. Upon the product of the workshops.

First, the effects of this road upon the real and personal property of the state.

Upon this head no certain dates are at hand. Referring, however, to the statistics already given on this subject in relation to New York and Massachusetts, it will be evident that in this respect Virginia would even excel those states.

The increase of improved lands in New York, in ten years after the completion of the Erie Canal, was, as has been already shown,

\$72,361,475.

Of real and personal estate in the city of New York,

117,563,637.

Of real and personal estate in

Boston from 1830 to 1845, 76,372,700.

Now then, when we consider what immense bodies of agricultural lands are now inaccessible between parallel ranges of the mountains which intersect the states from north-west to south west, and which would, for agricultural purposes, if accessible, be preferred on many accounts to lands more remote in the west, we can scarcely overrate the increased valuation of the real estate of the commonwealth which would follow upon the opening of this great road. There are millions of acres of these lands which would soon be converted into good stock and grain farms, but which are now almost valueless. Vast bodies of these lands are now entered for taxation at from ten to fifteen cents per acre, and upon that valuation pay only ten cents on each hundred dollars. When these waste lands are taken up, the commonwealth would derive from their increased value an immense revenue.

In point of original fertility and productiveness of soil, the territory of Virginia, taken as a whole, is not probably exceeded by that of any other of the "Atlantic states," and it is estimated that 50,000 square miles out of her whole area of 66,620, after making a liberal allowance for waste lands, are capable of sustaining a mean distributive population equal in number to that which occupies any of the best inhabited of its existing counties: (for example, Henrico including Richmond,) such a value would give Virginia more than 5,000,000 of inhabitants, a number far below the population she could support." (*Martin's Gaz.* p. 22.) This estimation is but a little higher than the present population of Massachusetts. From the geographical features of the state, it is obvious that this central improvement, more than any other, would open the whole territory and cause a vast increase of her population. New York, since she entered upon her great works of internal improvements, has nearly tripled her population, and it is highly probable, that, had the Old Dominion entered upon the same policy with equal zeal, she would at this time have numbered at least 3,000,000 inhabitants. It needs no argument to show that such an increase of her population would add more than 100,000,000 to the valuation of her real estate!

The effect of this great central work upon the product of the forest, is apparent from what has been already said in relation to the increased value of the real estate of the Commonwealth. "In the interior and western portions of the state are extensive forests of pine, oak, white wood, cherry, walnut, and other valuable timber, which would find a ready market by means of this road, and here it might be maintained, even admitting the general arguments urged by the advocates of canals in preference to railroads, for the transportation of lumber, that in this respect the Richmond and Ohio Railroad would seem to form an exception to their objection. The vast quantities of this valuable timber, which, in the form of planks, ship timber, staves, etc., would be transported to market, are found chiefly in the interior of the state.

From this section, coming east, the whole distance would be over an easy descending grade to Buchanan, where the road would meet the canal. This heavy trade would probably, to a great extent, be carried on thence upon the canal to tide water. Such transshipment would constitute no objection, for from this point eastward, the road would be fully occupied in the transit of light merchandise and passengers. Again, on the other side of the mountains, all the timber which would be transported, would find a ready cash market in the valley of the Kanawha, at the great salt works, and down the Ohio. In fact, the whole of this heavy trade, would be upon the descending grades upon each side of the Allegheny, and beyond question, could be taken over this central portion of the way, east and west, from the summit level, at a less expense than along a canal over the same region, considering the great delay and expense occasioned by the necessary lockage on this part of the route. It is impossible to arrive accurately at the value of the proceeds of the forest in Virginia. Upon the opening of this great line in 1810, the total value of these was \$616,569, and of those of the state of Maine for the same year, \$1,840,231. Now considering the vast extent of Virginia, and the immense quantities of lumber, ashes, ginseng, etc., which would find a market along this line, it would seem to be within bounds to estimate the whole value of the products at \$2,000,000 per annum for many years succeeding its completion.

The mineral wealth of the Commonwealth is inexhaustible, and the products of her mines would therefore constitute a very important part of the interior trade of the state upon this road. Iron, lime, coal, and salt are the principal of her mineral productions, and all these could be conveniently transported over the road. No state in the Union is richer in her mineral wealth than Virginia, and it is remarkable that her extensive beds of iron, limestone and coal, are found along the line of this central improvement. The fact that lime and iron are found in vast quantities along this line is one of great importance in the production of iron. Besides, this iron is of a superior quality. "It seems to be well ascertained by well authenticated experiments and trials at Richmond and at the north, that the iron coming from some of the mines in the valley possess a degree of tenacity unequalled by any other iron in America. A specimen of wire made of iron prepared at one of the establishments in this region, recently took the premiums both at the Franklin Institute in Philadelphia, and at the National Institute in New York, having borne a much greater tension than any other specimen exhibited. It is understood that the general government has declared its decided preference for the chain cables of the Virginia iron at the Tredegar Works, in the city of Richmond, over all the others that have been tried. It appears also that the guns manufactured at the works here mentioned have furnished additional evidence of the extraordinary tenacity of our iron. The

trial gun in recent experiments standing seven of the trial charges, whilst the best gun ever before used in America stood only four!! [See *Sup. Rep. of Jas. R. R. Co.*, 1846, page 712.] Besides the presence of lime along the belt of country containing the deposits of this valuable iron ore, there is an abundant supply of wood and coal. From the same high authority above cited, it appears that in much of the ore found along this great railway, there is a peculiar quality which fits it for conversion into the finer kinds of steel. All these considerations justify the inference that Virginia is soon to equal Pennsylvania in the production of iron. In 1844 the quantity of iron shipped on the main line of her great central improvements was 135,006,982 lbs., and the quantity of anthracite coal sent to market in 1845, was 2,000,000 tons, yielding a return to the state of more than \$7,000,000, and the total amount of toll received upon all her state works for coal and iron in 1844, was \$222,500 17. These facts will enable us to form some idea of the immense coal and iron business which will spring up in Virginia upon the construction of her great central improvement. Inexhaustible deposits of bituminous coal of the finest quality, are found, both in the east and in the west, in the valley of the great Kanawha, and near the city of Richmond. This will be also a source of immense profit. In the article of bituminous coal, Virginia already rivals Pennsylvania. In 1840 the former raised 10,620,654 bushels, and the latter only 11,620,654. In the article of salt also, the great salines of Virginia are important. It is, however, probable that much the greater part of the Virginia salt will find its way down the Kanawha and Ohio rivers. Considerable quantities will, however, be sent eastward, to supply the market along the western slope of the mountains. The quantity of salt produced in the state, mostly, at the Kanawha salt works, was 1,745,918 bushels in 1840.

The agricultural products of Virginia will also vastly increase upon the opening of this road. In this respect the Commonwealth is destined to hold a high rank among the states of the Union. In several of the great agricultural staples of the country, she already stands pre-eminent. In 1840 her rank was as follows:

Of Tobacco, Virginia gathered,	lbs. 75,347,106
" Kentucky "	" 53,436,909
Of Flax and Hemp, Va. produced, tons,	25,594
" Missouri "	18,010
Of Indian Corn, Virginia "	bush. 34,577,591
" Tennessee "	" 44,987,188
Of Wheat, Virginia "	" 10,109,716
" Ohio "	" 16,571,661

(*Hunt's Mer. Mag.*, vol. 13, p. 286.)

The quantity of wool produced in this state in 1840, was 2,538,374 pounds, and yet the whole central western and southwestern portions better adapted to the productions of this great staple, both in quantity and quality, than any other part of the union—are yet comparatively an unbroken wilderness.

Besides these principal products of the field immense quantities of hay, hops, hides, beans, peas, butter and cheese would be transported along the line, and greatly augment its ton-

nage. Large droves of cattle and hogs are annually driven from western Virginia, and from Kentucky and Ohio, through Virginia to Richmond. These would be transported over this line at a great saving of time and money, and come into market in much better condition. This latter is an item of great importance. The practical working of the Reading railway for the transportation of coal, the general produce and coal business of the Baltimore and Ohio, and the transportation of immense droves of cattle over some of the Hungarian railroads, are arguments which outweigh all that can be urged by opposites against railroads for the transit of heavy freights. These statistics give some promise of what would be the agricultural productions of the commonwealth, when once aroused to the development of her resources.

The products of the workshops or the manufactures of Virginia are the last item to be considered in this connection; of these, some reasonable anticipations may be formed by reflecting upon the immense water power, both in the valley of the great Kanawha and coal rivers in the west, and the James river in the east, which last, in connection with Richmond, have already been adverted to. In other parts of the state are sites for large manufacturing cities of unrivalled advantages. Indeed no state exceeds Virginia in these respects. The falls of the James, the Potomac and the Kanawha, accessible as they are by navigable waters, are inferior to none in the world.

Besides her water power which would come into requisition, her vast fields of bituminous coal, furnish every facility for the production of steam power. Large manufacturing establishments would spring up along the whole line as well as in other parts of the state. No city on the Atlantic board could vie with Richmond in the production of iron, woollen and cotton fabrics. To none could the raw material be so cheaply transported. Inexhaustible beds of coal are in her immediate vicinity. The pig metal of the valley could be transported on the canals and railroad for a trifling expense to her foundries. The whole western and southwestern parts of the state, unsurpassed in any country in the world, for the production of wool of the finest quality, would be brought in a few hours to her mills. The cotton of the south could with a much less expense be brought to her factories, than those of Manchester and Lowell. So also in the west within the limits of the state, are all the elements of manufacturing wealth.

It can hardly be deemed extravagant to assert that the valleys of the Kanawha, the Cole, and the Guyandotte rivers will at no very distant day, become filled with the workshops of the great Mississippi valley. By the charter of the company it is restricted in the manufacture of flour, to the western section of the state. But no doubt flouring mills will there be erected for the manufacture of flour, from the wheat of western Virginia, as well as for large quantities from the granaries of the west. In this manufacture, Vir-

ginia already holds a high rank in the union for the excellence of her flour. This fact will induce the large farmers of the west to send their wheat to the mills along this line, to supply flour for foreign trade. The quantity of flour manufactured in Virginia in 1840 was 1,061,526 barrels. In 1840 the whole value of manufactures in Virginia was \$8,508,016. Such are a few statistical facts connected with the vast manufacturing resources of the Old Dominion, and they are presented, not so much to show what Virginia is, but to afford some presage of her future greatness. No railway in the union can be constructed through 400 miles of country, which in the variety and greatness of its resources, could furnish more business along its line than her own great central improvement, and besides as a great natural trunk, based upon the tide waters of the Atlantic, it opens in the west into the centre of a grand system, composed of canals and railways, of navigable lakes and rivers, unequalled in extent by any other on the face of the globe.

Several other subjects affecting the character of this road will be here referred to.

As a grand trunk forming the basis of a system of railroads within the commonwealth it will be most favorably located. The great valley of Virginia drained by the Shenandoah and the James river, would be crossed nearly at right angles, and would, by means of lateral roads, furnish a vast amount of tonnage for transportation. On the south the great southwestern road would soon be opened, and bring into this great central channel the mineral and agricultural productions of the southwest sections of the state. This would soon be extended into the valley of the Tennessee river, and probably carried through to the Mississippi. The Richmond and Danville road, opening into the southwestern counties, and extending into North Carolina, would also bring to this common trunk an immense business. The valleys of the Jackson, Greenbrier, and the New River, would also be unlocked by this railway, and contribute a valuable accession to its trade. As a great travelling thoroughfare, this route would be thronged by multitudes passing from east to west and from north to south. This would be the case a great part of the year, even should Virginia remain as at present in a state of commercial dependence on the north—for as a great line of intercourse between New York and the southwestern cities, it would be the favorite route at those seasons when the travel was impeded on the northern routes, either by snow or the low water of the Ohio. But still more would it become a highway for the merchant, should Norfolk and Richmond become great commercial and manufacturing cities, as they would should Virginia be true to herself. As a means of approach to the federal city, the Richmond and Ohio railroad would accommodate the southwestern members better than any other, and especially as the meeting and adjournment of congress occur at those seasons when the more northern routes are most likely to be obstructed. Indeed the same will hold true with the mercantile community, who

usually seek the Atlantic cities early in the spring or late in the autumn, while those who travel for pleasure make their journeys more usually in the midst of summer when the Ohio is low; at this season the watering places in Virginia are thronged with visitants. Many thousands annually visit those springs, and their number no doubt would be tenfold if the railroad car were substituted for the tedious and expensive stage coach. As to the business of this route, the writer does not possess certain data from which to make any comparison with the other routes, yet he is fully confident that in this respect also it will compare most favorable with any other. The fact that the whole road will be under the direction of one company, added to its great facilities for business and travel, will enable the company to transport freight and passengers over their line as low as upon any other road across the Alleghenies. Flour could undoubtedly be carried from Guyandotte to Richmond for 50 cents a barrel, and passengers for \$10 each. Another source of income would grow out of the large coasting business which the road would originate. The produce of the west destined for the central cities and ports of the Atlantic coast north and south of Norfolk could be better supplied by this road than any other. So also would immense quantities of this produce be shipped at its eastern terminus, for foreign ports, and the ships of Boston and New York would here also discharge large quantities of merchandize for the western trade. The sale and transportation of produce designed both for foreign and domestic ports, and the importation of western merchandize would greatly augment the trade and population of Richmond and Norfolk, and increase the business of the road.

In regard to the cost of this road, owing to the open route granted in the charter, and the comparatively small expense of the right of way, as also from the fact, that all the materials for the construction of the road, such as timber, lime, stone, hydraulic cement, etc. are found in abundance along the line, especially from the probability that the company will, to a great extent, manufacture their own rails; it is believed that the entire road will not exceed \$10,000,000. The interest, on this capital, would be, at 6 per cent. \$600,000. It will be necessary, therefore, that, in order to pay, the income from the business of the road must be at least \$760,000. This allows 400 per mile for the annual expenses of the road.

It might be noticed here, that the net income of the Western railroad from Boston to Albany, for the year 1846, was \$680,585; and of the Baltimore and Ohio railroad for the year 1845, the revenue was \$729,920. Thus it appears that the Western railroad, of 200 miles, competing with 150 miles of the best steamboat navigation in the world, and also the Baltimore and Ohio, extending only 178 miles, or about half the distance to its contemplated western terminus, have each of them earned nearly as much as would be required for the Richmond and Ohio, in order to nav the annual repairs, and divide six per

cent. Who that reflects upon the great advantages of this road, would not readily see that the net income of this great railway, at least 400 miles in length, would be more than double that of the Baltimore and Ohio in its unfinished state. In the able report of the late president of the James River and Kanawha company, it is shown that 500,000 tons, at half a cent a ton, would pay the annual charges of a water line through the state, from Richmond to Point Pleasant, and divide six per cent. on \$15,000,000, the estimated cost of such a work; and that the iron trade alone originating along the line, would, in a few years meet three-tenths of that amount.

In 1846, the tonnage on the Erie canal, arriving at tide water on the Hudson, was 669,012, and going from tide water on the Hudson, 129,580, making a total tonnage of 898,592. Now, if the through tonnage of this line, be taken at 200,000 tons, what charge, per ton per mile, would have to be made to defray the expense of the line? Mr. Roebling lays down an important principle, that the profitable success of railroads, like other mechanical operations, will greatly depend upon the amount of work done; and in a table furnished by him, it appears that on a road with a double track, built at an expense of 50,000 dollars per mile, and whose gross tonnage was only 40,000, in order to declare a dividend of 6 per cent. upon the capital invested the charge for freight per ton per mile, would have to be 84 cents;—whereas, if the gross tonnage amounted to 200,000, the charge would only be 2.22 cts. According to this table, estimating the cost of the road at 25,000 per mile, and allowing 200,000 through tonnage, the charge per ton per mile would have to be 1.47 cents, and allowing only 100,000 tonnage, the charge to warrant the same dividend, would be 2.29 cents.

No well informed man, who duly considers the advantages of this line, and reflects upon the amount of business which it will create throughout the whole of the state, and upon the amazing productiveness of the west already sufficient to fill every avenue leading to the seaboard, and still rapidly increasing almost beyond the power of computation, can for one moment doubt that the tonnage of this thoroughfare will vastly exceed the amount above stated. More than the income above required to pay a dividend of 6 per cent. per annum, would undoubtedly be derived from passengers alone.

Estimating the travel upon this line as equal to 75,000 through passengers, and the fare from Guyandotte to Richmond, at three cents per mile, or twelve dollars, the income from this source would be 900,000 per annum. But if we look upon the travel of the other great lines of railroads in the United States, and especially upon the Baltimore and Ohio, in its present unfinished state, the inference is a fair one, that the travel through this line, would at least be equal to 100,000 through passengers; this, at the above rates named, could produce 1,200,000 dollars. The income from freights would, beyond question, be equal to that derived from travel, which

would give, as the proceeds of the road, 2,400,000. If we were to take the proceeds of the Baltimore and Ohio road as a basis of calculation, the income of the Richmond and Ohio would soon exceed this vast sum per annum. By recurring to their last annual report, it appears that the travel upon their road for the last year was, in round numbers, equal to 52,000 through passengers.

That this number would be more than doubled upon the completion of their route, cannot be doubted. Giving to the Richmond and Ohio railroad the same travel with the Baltimore and Ohio railroad in comparison with their respective lengths and the income of the former would be at three cents per mile for each passenger, 1,332,000 dollars.

But to enable us to approximate towards the probable tonnage of this line, let us make an estimate of some of the staple productions which would be transported over the road. The Ohio crop of wheat in 1840, in round numbers, was 17,000,000 bushels, and in 1846 probably not less than 22,000,000 bushels, equal to 4,500,000 barrels of flour. Allowing 2,500,000 for seed and home consumption, we have 2,000,000 barrels for exportation. Now allowing one-fourth of this to pass over the road at 50 cents per barrel, and we have 500,000 barrels, at 50 cents per barrel, 250,000 dollars.

The quantity of tobacco transported over this road, considering the reputation of Richmond as a tobacco mart, and the strong probability that the tobacco of the west will be sent hither, rather than to New Orleans, and it will be safe to estimate the quantity at 50,000 hogsheads,

Which, at \$4 per hogshead, is.....	\$200,000
Pork, say 200,000 barrels, at \$1 per barrel.....	200,000
Live hogs, 30,000, at \$1 per head.....	30,000
Freights from iron, and the materials connected with its manufacture, estimated as only equal to 50,000 tons through the whole line at 14 cents per mile per ton, and we have.....	300,000
Miscellaneous freights, including lumber, hemp, flax, wood, wool, salt, ginseng, etc.	200,000
For travel, equal say to only 75,000 through passengers, and at even \$10 each, 2 1-2 cents per mile.....	750,000
Merchandize going west, 47,000 tons at 24 cents per mile per ton.....	470,000

Making a total of.....\$2,400,000

These estimates are relied upon only as approximates, and yet it would be difficult to make them less, considering the immense advantages of this work. Now, if one-half of this amount be taken as the net proceeds of the road, we have 1,200,000, equal to a dividend of 12 per cent. upon the cost of the road, and that, too, without taking into consideration any profits which the company would derive under the charter, from the extraordinary land and manufacturing privileges. In conclusion, it is gratifying to know that this great railway is attracting the favorable notice of the public, and especially of enlightened and high minded advocates of rival lines—and it is to be hoped that the citizens of Virginia will make liberal subscriptions to its capital stock, and thus, by inspiring confidence abroad, secure the immediate accomplishment of this noble enterprise.

# CHILLED CAST IRON WHEELS FOR RAILROADS.

**ANNEXED ARE LITHOGRAPHS OF CHILLED CAST IRON RAILROAD WHEELS,** to which I would call attention.

Having been extensively engaged, for 12 years past, in the manufacture of Chilled Wheels, both for Engines and Cars, I recommend them as a good article. The result of my long experience has pointed out various improvements in the form of Spoke, disposal of Metal in the Rim of Wheels, and the mixture of Iron in the Foundry; I feel confidence, therefore, in saying, that my wheels are, in every respect, equal to the best that are made in the country.

The Ring Wheel is a patent article, and from long experience has been found to be superior to every other description of chilled wheels. A Malleable Iron Ring is cast in the Body of each Wheel, which serves the purpose of Chilling much more perfectly, immediately over the Ring, and at the Joint of the Tread and Flanch, than can be done by any other mode. This part of a wheel is rarely well chilled without the use of the ring, and the severe action when in use at this particular point on a wheel, wears it most rapidly away, and renders them unfit for use, notwithstanding the other parts are well chilled. The wrought iron ring also secures the cast iron wheel against the liability of disaster from breakage.

I would call attention also to the Shape given each Spoke: they are formed on the same principle as the Tapered Axle, and relieve the Wheel from sudden shocks, by a proper distribution of the vibrations caused by such shocks, and which if allowed to centre at one point, soon break the wheel. The disposition of the metal in the rim is found, on long experience, to be the best for chilling.

The Chilled Driving Wheels, for Locomotive Engines, I can also recommend, as well on their own merits, as the fact that the demand for them has very materially increased during the past two years. The Baltimore and Ohio, Baltimore and Susquehanna, and Philadelphia, Wilmington and Baltimore Railroads use them entirely. These wheels have to recommend them—that they are much lighter than the cast iron wheels with wrought iron tires; their use entirely does away with the expense and trouble in the constant turning and refitting consequent upon the use of wrought iron tires, and their first cost is materially less than that of wrought iron tired wheels—the chilled wheels being about one-half, and their durability is double that of tired wheels.

These facts, together with the assurance of the Roads immediately around me, that engines which have had chilled drivers substituted for wrought iron tired wheels, evinced no want of tractive power, growing out of such a change, but performed their daily work with the same ease and with less trouble than heretofore, suggest the propriety of calling attention to them.

Wheels, with or without rings, of any particular stand of hub, or pattern, (when the order is such as to warrant the expense,) other than the drawings show, will be forwarded to order with despatch, either in the rough, or keyed and banded, or fitted on axles, as may be desired. I have on hand various other wheel patterns, not represented in Lithograph; these I send a sketch of as most used at present.

Railroad Work of all kinds I am extensively engaged in the manufacture of: Locomotives for Freight or Passenger Transportation, Iron Cars for Coal, Frame cars and Trucks, together with Stationary Engines and foundry work of all descriptions.

Address ROSS WINANS, *Baltimore, Md.*

## GUN COTTON.

We are indebted to Messrs. John Hall & Sons, of Lombard street, for the following copies of letters received from their agent, Mr. John F. Wheeler, giving details of further and most satisfactory experiments in blasting, with this new and wonderful power. The statements are so explanatory in themselves, as to require no comment from us.—*London Mining Journal.*

"GENTLEMEN: I beg to enclose you my report on blasting with the patent gun cotton, at the Holyhead Mountain, Anglesea; the Holland Slate Quarry, Frestiniog, Merionethshire; and at the Hon. Col. Pennant's slate quarries, Penrhyn, near Bangor, Carnarvonshire. The experiments at Holyhead were made in the presence of Capts. Vidal, Collinson and Shepherd, commissioners from the admiralty; Mr. Beardmore, Mr. Dobson, Mr. Liester and Mr. Clifford, engineers, and several gentlemen interested in the matter.

The rock upon which these experiments were made is exceedingly hard, of a meta-

moritic character, mica and chlorite slate, with quartz.

The results gave the most convincing proofs of the vast superiority of the patent gun cotton over gunpowder, which was acknowledged by all the gentlemen present.—The gunpowder used in these experiments was the best ordnance gunpowder. The next series of experiments were made at the Holland Quarry, Frestiniog, Merionethshire, in the presence of Mr. S. Holland, Jr., Mr. H. Stock, of Port Madoc; Mr. C. Spooner, Port Madoc; Mr. R. Jarrett, Frestiniog; Mr. R. Lloyd, Frestiniog; Mr. Searle, of Carmarthen; Mr. Chisel, of the Welsh Slate Co.; Mr. Owen Pritchard, of Messrs. Matthews & Sons; Mr. Owen Jones, of Messrs. Shelton & Greaves; Mr. Hughes, of Messrs. Casson & Co.; Mr. Selwyn, Mr. Hill and other gentlemen.

The first of the experiments tried in this quarry were made upon an extremely hard calcareous stone, the others upon the slate; the admirable manner in which the slate was removed from its bed by the patent gun cotton elicited the most general satisfaction, and gave

incontestible proof of its suitability in blasting slate, being far superior to gunpowder; the pieces removed by the cotton were large valuable masses. The last experiments made were in the slate quarries at Penrhyn; there were present at these, Mr. Wyatt, Mr. Frances, Dr. Roberts, and others. The wonderful effect produced by the cotton was, you will find by reference to the tabular form, more astonishing than anything hitherto tried—the huge mass of 60 tons weight was gently pushed from its firmly bound bed, by the explosion of only eight ounces of cotton; no splintering of slate took place, which greatly astonished the workmen, many of whom expressed that the danger was far less by its use than gunpowder. The gentlemen present acknowledged the superiority of gun cotton over gun powder to be in ordinary slate work in the proportion of six or seven to one, and in hard rock to be four and five to one.—Some other experiments were tried by me at Fridd Issa Quarry, about two-thirds up the Snowdon Mountain, with similar good success.

J. F. WHEELER.

Bangor, May 5.

# CHILLED CAST IRON RAIL ROAD W

Manufactured by

## ROSS WINANS

BALTIMORE MD

a strong light wheel suitable for tenders & trucks

lb. Wheel  
other Southern Roads

31 inch 360 lb. Ring Wheel  
a strong light wheel suitable for tenders & trucks

*Experiments made in blasting with gun cotton in the slate quarries of the Hon. Col. Pennant, at Penrhyn, near Bangor, Carnarvonshire.*

No. of Expts.	Depth of Hole.	Diameter of Hole.	Quantity of gun cotton used.	Quant. of slate removed.	Gunpowder required for the same w'tk.
	ft. in.	inches.	ounces.	tons.	
1	4 2	1 1/2	8	tube 30	40oz. (1)
2	6 5	1 1/2	8	tube 60	48oz. (2)
3	8 0	1	8	loose 60	48oz. (3)
4	4 0	1 1/2	8	loose 3	24oz. (4)

The results of the above experiments were considered admirable by every one present—producing just the effect so much desired in slate quarrying.

*Remarks.*

- (1.) In red slate, commonly called by the men "granite," owing to its great hardness.
- (2.) Hole driven in horizontally—the whole mass gently forced from its bed, just as required by the quarrymen.
- (3.) Hole in a similar position, and the result equally good.
- (4.) This "shot" being in a very fast place ought to have had one ounce more of cotton.

*Experiments made in blasting with gun cotton and gunpowder at Mr. Holland's slate quarry, Festiniog, Merionethshire.*

Depth of Hole.	Diameter of hole.	Distance of hole from face of rock.	Weight of powder.	Weight of cotton.	Weight of stone removed.
ft. in.	inches.	ft. in.	ozs.	tube 4 ozs.	tons.
2 3	1 1/2	2 6	16	.....	2 1/2 (1)
2 3	1 1/2	2 0	16	.....	2 1/2 (2)
2 3	1 1/2	3 0	16	tube 4 ozs.	3 (3)

The above experiments were made upon an exceedingly hard calcareous stone.

3 6	1 1/2	3 6	2	ozs.	— (3)
2 0	1 1/2	1 4	6	.....	— (3)
3 1	1 1/2	2 6	1 1/2	ozs.	2 1/2 (4)
5 0	1 1/2	5 6	3 1/2	ozs.	9 (5)
2 0	1 1/2	5 0	2	ozs.	— (6)
2 6	1 1/2	4 6	16	.....	4 1/2 (7)

*Remarks.*

- (1.) In stemming down the fuse was cut. The stemming drawn out and cotton fixed; split the stone 4 feet down.
- (2.) The slate cracked, but not removed.
- (3.) Did not fire—"smoked."
- (4.) This was in a fast place—removed the slate in a fine piece.
- (5.) Removed in fine and valuable pieces.
- (6.) Removed from its bed in fine large pieces.
- (7.) Shattered, and thrown about in useless pieces.

*Experiments made in blasting with gun cotton and gunpowder on the Holyhead mountain.*

Depth of Hole.	Diameter of Hole.	Distance of hole from face of rock.	Weight of powder used.	Weight of cotton used.	Weight of stone removed.
ft. in.	inches.	ft. in.	ounces.	ounces.	tons.
4 0	1 1/2	3 6	40	.....	18 (1)
4 6	1 1/2	4 6	40	.....	19 (2)
4 0	1 1/2	4 0	..	paper tube, 8	17 (3)
4 6	1 1/2	6 0	40	.....	16
3 1	1 1/2	5 0	..	loose, 10	17 1/2
3 1	1 1/2	4 0	..	tube, 6	9
3 1	1 1/2	4 0	..	tube, 6	8
3 6	1 1/2	3 6	16	.....	3
3 0	1 1/2	3 0	..	tube, 6	— (4)
3 0	1 1/2	2 0	16	.....	2 1/2

The character of the rock is metamorphic

—a mica and chlorite slate, exceedingly hard, but much ruptured.

*Remarks.*

- (1.) Much broken and thrown from the face.
- (2.) Not so much broken, but easily removed.
- (3.) Removed in large blocks, one weighed 2 1/2 tons.
- (4.) Not weighed. J. F. WHEELER.

*ITEMS.*

**A Large Casting.**—On Saturday afternoon the 13th instant, Messrs. T. F. Secor & Co., of this city, moulded the bed plates for the new steam-ship United States, one of the four packets to run between New Orleans and Liverpool. The casting weighed over 24 tons. The most of the metal was from Iron-  
dale, Pennsylvania, with a slight mixture of Scotch pig. The engines are to cost \$115,000. These steamers are to be 2,200 tons burden. The United States is to have two side-lever marine engines, of 82 inch cylinder and 9 feet stroke, each of the power of more than 1000 horses.

The Tribune says, could Robert Fulton but have lived to see our day, and he would not have been a very old man, he would have gone down to the tomb full of honors more solid and lasting than ever decked the triumphal car of a conqueror.

**Great Telegraphic Experiment.**—New Haven was put in telegraphic communication with Toronto, Upper Canada, recently, and messages were instantly exchanged between the two cities. The route is via New York, Albany, Rochester, Buffalo, and then crossing the Niagara river below the falls, passes round Lake Ontario to Toronto, the entire distance being nine hundred miles! The experiment was a most successful one, and the distance was overcome with as much apparent ease and promptness, as between New Haven and Hartford. It was the longest distance ever traversed by the lightning in a continuous unbroken line.—*New Haven Herald.*

**Portsmouth and Concord Railroad.**—The annual meeting was holden on the 12th ult.—The report of the directors states, "that as the amount of stock now subscribed exceeds \$600,000, it will be in their power soon to put the whole line of the road from Portsmouth to Concord under contract."

We were very glad to learn these facts. Portsmouth, like most Atlantic towns, long ago discovered the necessity of creating resources aside from improving those with which nature had blessed her. Her barbor is one of the best in the world, but for a long time business at that place has ceased to increase, owing to the increased means that have been provided for approaching Boston. Boston has, indeed, made New Hampshire a mere tributary to her, and the inhabitants of the Granite state have come to think, at last, that the very clothes they wear, and the delicacies of their table must be obtained from the city.

We have seen this state of things with no little regret; and we now always hail the sight of the tall chimney to the mammoth

factory lately erected in Portsmouth, with nearly as much pride as the sight of the column on Bunker's Hill. The latter tells of past achievements, the former of present prosperity.

We wish all success to the railroad enterprise in which Portsmouth is engaged, believing that she could take no safer step to advance her own interests.—*Lewiston Falls Journal.*

**Unruly Locomotive.**—The editor of the Georgia Luminary has been informed by a gentleman acquainted with the circumstance, that a new and splendid locomotive named Gen. Taylor, tried on a railroad in Georgia, would not back.

**Railway Expenditure in Great Britain.**

We find in Herapath's Journal of 15th May an article on the subject of Railway expenditures in Great Britain, which shows clearly the rapid increase of Railroads.

The whole expenditure up to January 1, 1841, was less than £30,000,000, while it amounted to over £46,000,000 from that time to January 1, 1847—a period of only six years—or nearly eight millions a year—an amount almost incredible—yet a trifle when compared with the expenditure of the current year, which will probably exceed £30,000,000! and if the calls for the last seven equal those of the first five months, they will amount to over £38,000,000, or \$190,000,000!!

**Expenditure in the Construction of Railway Works.**—It appears from a recent return, that the money expended in the actual construction of all railways in Great Britain and Ireland, prior to the 1st of January, 1841, amounted to £29,909,435; from that period to the 1st of January, 1844, £12,165,006 were expended; and from thence to the 1st of January, 1847, a sum was expended in a similar manner, of \$34,627,203: Total, £76,821,644. This shows an average expenditure between 1841 and 1844, of £4,055,002 per annum, and between 1844 and 1847, of £11,552,401 per annum, on the construction of works.

There was also expended on Working Stock, independent of the above, prior to the 1st of June, 1841, £2,151,844; from that period to the 1st of January, 1844, £1,441,023; and from thence to the 1st of January, 1847, £3,714,108: Total expenditure on Working Stock, £6,596,212.

This would show an average outlay during the former three years, of £480,341 per annum, and during the latter period, an average expenditure on Working Stock, of £1,038,036 per annum.

These returns, however, are not complete; they do not include those of the Grand Junction, Manchester and Birmingham, and the Liverpool and Manchester,—all of which now belong to the northern division of the London and North Western Railway. Neither do they include those of the Manchester and Leeds, the Manchester, Bolton, and Bury, and others, and for which, a sum of £10,000,000 may fairly be added to the above, making the total expenditure on the construction of railway works, about £86,100,000, and on Working Stock, engines, carriages, etc., £7,428,619, including a total

expenditure on railway works and working stock only, of £93,528,619 up to the commencement of the present year. Of this sum £7,034,255 has been expended upon new lines not yet opened. Since the 1st of January last, and including the present month, the total amount of calls for the United Kingdom during the five months is £15,937,431, and should calls continue to be made on the above railways at the same rate during the next seven months, the total for the year will amount to about £18,250,000. Should this sum be obtained and expended, the average expenditure of the present year on railway works will be nearly three and a-half times that of the three preceding years. It may be interesting to know that the principal part of the above sum, £93,528,619, has been disposed of by private agreement between the directors and the contractors, public competition being generally discouraged in these matters. It is, therefore, not surprising that some Railway directors should be so tenacious of retaining their seats at the Boards, and that several Railway contractors who have already accumulated enormous wealth by these transactions between themselves and the directors, should have advanced into the "Directory line," as they term it, dispensing those good things on their own account, which they were formerly obliged to receive at second or third hand.

As long as those lucrative privileges are attached to the office of certain Railway directors, it is not probable that there will be any deficiency of railway projects. During last session the legislature sanctioned projects to the extent of £120,000,000; of this sum about £90,000,000 will be required for the construction of works and the purchase of locomotive stock, which I trust will be disposed of by public tender, instead of by the former practice. The projects this year are chiefly promoted by established Railway Companies, and appear, from the report of the Railway Commissioners, to be of a most extensive character, involving serious liabilities on the Shareholders. These Bills will probably furnish directors with the disposal of a further sum of £70,000,000 under the above head. T.

**BACK VOLUMES OF THE RAILROAD JOURNAL** for sale at the office, No. 105 Chestnut street.

**A. & G. HALSTON & CO., NO. 4** South Front St., Philadelphia, Pa.

Have now on hand, for sale, Railroad Iron, viz: 180 tons 24 x 1 inch Flat Punched Rails, 20 ft. long. 25 " 24 x 1 " Flange Iron Rails. 75 " 1 x 1 " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures. 111

**TO RAILROAD CONTRACTORS.**—PATerson and Ramapo Railroad.—Proposals will be received until the 30th day of June, inst., for the Grading, Masonry and Bridging that part of the Paterson and Ramapo Railroad, extending from the north side of the Passaic river to Ramapo, a distance of about 14 miles.

Maps, Profiles and Specifications may be found at the Engineer's Office, Paterson, where every necessary information will be given.

225\* J. W. ALLEN, Engineer.

**PATENT RAILROAD, SHIP AND BOAT** Spikes. The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

•• Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand. ja45

#### MANUFACTURE OF PATENT WIRE

Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by JOHN A. ROEBLING, Civil Engineer, Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition. 2v19 1y

#### FRENCH AND BAIRD'S PATENT SPARK ARRESTER.

**TO THOSE INTERESTED IN** Railroads, Railroad Directors and Managers are respectfully invited to examine an improved Spark-Arrester recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger & freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. McKee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Flak, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckly & Drury, Boston, will be promptly executed. FRENCH & BAIRD.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms. Philadelphia, Pa., April 6, 1844.

•• The letters in the figures refer to the article given in the Journal of June, 1844. ja45

**PATENT HAMMERED RAILROAD, SHIP** and Boat Spikes. The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed. JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y. The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merritt, New York; J. H. Whitney, do.; E. J. Etting, Philadelphia; Wm. E. Coffin & Co. Boston. ja45

**MACHINE WORKS OF ROGERS,** Ketchum & Grosvenor, Paterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

#### Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR, Paterson, N. J., or 60 Wall street, N. York. ja45

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.  
Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

### THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trestles is 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trestles, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trestle for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.	
4,224 Timbers, 11 ft. long, 3 x 6 inches =	
68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	
4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs. at 4½ cts. =	101 25
Workmanship free of patent charge.....	600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.

Civil Engineer and Patentee.

No. 277 South Tenth St., Philadelphia.

### LAP-WELDED WROUGHT IRON TUBES

FOR

### TUBULAR BOILERS, FROM 1 1-4 TO 6 INCHES DIAMETER, and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manufacture as those so extensively used in England, Scotland, France and Germany, for Locomotive, Marine and other Steam Engine Boilers.

THOMAS PROSSER,

Patentee.

1y25

28 Platt street, New York.

### RAILROAD IRON.

#### MOUNT SAVAGE IRON WORKS

THIS Company are prepared to execute orders for RAILROAD IRON, of any pattern, and equal in point of quality to any other manufactured.

Address J. M. HOWE,

Pres't. Mt. Savage Iron Works,  
Dec. 25, 1y\* Maryland.

### ENGINEERS' AND SURVEYORS' INSTRUMENTS MADE BY EDMUND DRAPER, Surviving partner of STANCLIFFE & DRAPER.

No 23 Pear street,  
1y10 near Third,

below Walnut,  
Philadelphia.

road Depots, etc.

ANDREW MENEELY.

West Troy, May 12, 1847.

1y\*21

**PIG AND BLOOM IRON.—THE SUBSCRIBERS** are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by

A. WRIGHT & NEPHEW,  
Vine St. Wharf, Philadelphia.

12cf

**RAILROAD IRON.—THE "MONTGOMERY"** Iron Company, Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to

MURDOCK, LEAVITT & CO.,

Agents.

1y48

77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC** Cement. This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight papered barrels, by JOHN W. LAWRENCE,

142 Front street, New York.

Orders for the above will be received and promptly attended to at this office.

331\*

# RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

## ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—

for sale or imported to order by the subscriber. These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,

75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH Tons.
Wire gauge number.	Circumference of rope. INCH.	Weight per fathom. LBS. OZ.	Circumference of rope. INCH.	Weight per fathom. LBS. OZ.		Weight per fathom. LBS.	Diameter of iron. INCH.	
11	4½	13 5	10	24 -		50	15-16	20
13	3½	9 3	8½	16 -		27	11-16	13½
14	3	6 11	7½	12 8		17	9-16	10½
15	2½	5 2	6½	9 4		13½	1-2	7½
16	2½	4 3	6	8 8		10½	7-16	7

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1y24

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLICOTT & ABBOTT.

Factory, 9th street, near Coates, cor. Melon st.

Jan. 14, 1846. [1y4]

**RAILWAY IRON.—THE BEST QUALITY** of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by

DAVIS, BROOKS & CO.,  
68 Broad St., New York.

Jan. 2. [1y4]

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed.]

WILLIAM ROE, Sup't of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed.] G. A. NICOLL,

Sup't Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed.] T. L. SMITH,

Jersey City, November 4, 1845.

N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed.] JOHN LEACH,

Jamaica November 12, 1845.

1y19 Sup't Motive Power

## NICOLL'S PATENT SAFETY SWITCH

for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee

G. A. NICOLLS,

ja45

Reading, Pa.

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

THOMAS & EDMUND GEORGE,

ja45 N. E. cor. 12th and Market sts., Philad., Pa.

**RAILROAD IRON.—THE NEW JERSEY** Iron Company, Boonton, N. J., are now making Railroad Bars, and are prepared to execute orders for any required pattern. Apply to

FULLER & BROWN, Agents,

No. 139 Greenwich, corner of Cedar street.  
June 1, 1847. 10d

**RAILWAY IRON.—DAVIS, BROOKS** & Co., No. 68 Broad Street, have now in port on Ship-board, 200 Tons of the best English heavy H Rails, 60 lbs. to the lineal yard, which they offer for sale on favorable terms, also, about 6 to 700 Tons now on the way, to arrive shortly, of the same description of Rail. 46d

## NORRIS' LOCOMOTIVE WORKS.

BUSH HILL, PHILADELPHIA, Pennsylvania.

MANUFACTURE their Patent 6 Wheel Combined and 8 Wheel Locomotives of the following descriptions, viz:

Class	1,	15 inches	Diameter of	Cylinder,	× 20 inches	Stroke.
"	2,	14	"	"	× 24	" "
"	3,	14½	"	"	× 20	" "
"	4,	12½	"	"	× 20	" "
"	5,	11½	"	"	× 20	" "
"	6,	10½	"	"	× 18	" "

With Wheels of any dimensions, with their Patent Arrangement for Variable Expansion.

Castings of all kinds made to order: and they call attention to their Chilled Wheels, for the Trucks of Locomotives, Tenders and Cars.

NORRIS, BROTHERS.

**KEARNEY FIRE BRICK. F. W. BRINLEY**, Manufacturer, Perth Amboy, N. J. Guaranteed equal to any, either domestic or foreign. Any shape or size made to order. Terms, 4 mos. from delivery of brick on board. Refer to

**THE NEWCASTLE MANUFACTURING** Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention. **ANDREW C. GRAY**,  
a45 President of the Newcastle Manuf. Co.

**RAILROAD IRON AND LOCOMOTIVE** Tyres imported to order and constantly on hand by **A. & G. RALSTON**  
Mar. 20th 4 South Front St., Philadelphia. 28th

**VALUABLE PROPERTY ON THE MILL** Dam For Sale. A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 68,497 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x32 ft, with lathes, work benches, Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, turnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45½ feet two stories high, with a shed part 45½x20 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 200 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to **HENRY ANDREWS, 48 State st.**, or to **CURTIS, LEAVENS & CO., 106 State st.** Boston, or to **A. & G. RALSTON & Co., Philadelphia.** ja45

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

**PASCAL IRON WORKS.**

**WELDED WROUGHT IRON TUBES**

From 4 inches to 4 in calibre and 2 to 12 feet long, capable of sustaining pressure from 600 to 2500 lbs. per square inch, with Stop Cocks, T. L. and other fixtures to suit, fitting together with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER PLANS.

Manufactured and for sale by

**MORRIS, TASKER & MORRIS.**

Warehouse S. E. Corner of Third & Walnut Streets,

**PHILADELPHIA.**

**TO LOCOMOTIVE AND MARINE ENGINE BOILER BUILDERS.** Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

**MORRIS TASKER & MORRIS,**

Warehouse S. E. corner 3d and Walnut Sts., Philadelphia. 11f

**PATENT INDESTRUCTIBLE WATER**

Pipes. The subscribers continue to manufacture the above PIPES, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly *indestructible*. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York.

**J. BALL & CO.**

**SPRING STEEL FOR LOCOMOTIVES.**  
Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1½ to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,

**THE SUBSCRIBER IS PREPARED TO**  
execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip.  
New York.

**LOCOMOTIVE AND CAR AXLES.**  
The Subscribers are now prepared to receive orders for the well known and approved Reading Locomotive and Car Axles—drawn to any required pattern from Bloom Iron only. Address

SAM'L KIMBER & CO.,  
Willow Street Wharf,  
Philadelphia, Pa.

**NOTICE TO CONTRACTORS.—ANDROS-COGGIN AND KENNEBEC RAILROAD.**  
Proposals will be received at the Railroad Office, in Lewiston, until the 17th of June next, for the Grading and Masonry of the 1st Division of the Road, extending from the Atlantic and St. Lawrence Road in Danville, to Green centre, 14½ miles.

Also, separately, for the Masonry and Woodwork of the Bridges across the Great and Little Andros-coggin Rivers, the Bridges to be constructed on Towne's plan.

Plans and Profiles will be ready for examination, and the route shown, on and after the 10th of June. Satisfactory surities will be required of bidders unknown to the officers of the company.

The 2d Division, extending to Snow's Pond in Belgrade, 25 miles, will be ready for contract about the 25th of July; and the remainder of the road to Waterville, about the 20th of September.

HOBERT CLARK, Agent A. & K. R. R.  
EDWARD APPLETON, Engineer.

Railroad Office, Lewiston, May 8, 1847. 4121

**THE SUBSCRIBERS ARE PREPARED TO**  
execute orders at their Phoenix Works for Railroad Iron of any required pattern, equal in quality and finish to the best imported.

REEVES, BUCK & CO.,  
Philadelphia.

ROBERT NICHOLS, Agent,  
No. 79 Water St., New York.

**CONCORD RAILROAD.—PASSENGER**  
Trains in connection with the Lowell & Nashua Railroads, run daily between

Concord and Boston, Sundays excepted, as follows, viz:

Leave Concord at 5 40 and 11 5 a.m. and 3 15 p.m.  
Leave Boston at 7 and 11 a.m. and 5 p.m.

This road runs by Nashua and Manchester to Concord N. H., where it connects with the Northern railroad, extending from Concord to the mouth of White river in Vermont, 18 miles of which road, to Franklin, is now opened, and the remainder is rapidly completing.

It is the direct route to Central and northern New Hampshire, and to Montpelier, Burlington, and other towns in northern Vermont, and has a greater proportion of railroad conveyance in those directions than any other line.

It is also the British Steam Mail Line, and the nearest route from Boston to the Canadas. Numerous stages connect with all parts of the road.

For further information, apply at B. P. Cheney & Co.'s Express office, No. 8 Court St., and Averill & Dean, No. 15 Elm St.

All passengers' baggage should be properly marked, and when valued at more than \$50, notice must be given, and extra charges paid, or no loss beyond such amount will be allowed.

N. G. UPHAM, Supt.

**NEW YORK AND ERIE RAILROAD LINE**  
SUMMER ARRANGEMENT. For passen-

gers, twice each way daily, (except Sunday,) leave New

York from the foot of Duane St. at 7 o'clock, A. M. and at 4 o'clock, P. M. by steamboat, for Piermont, thence by cars to Ramapo, Monroe, Chester, Goshen, Middletown, Otisville, and the intermediate stations.

The return trains for New York will leave Otisville at 6 30, A. M. and 4 15, P. M.; Middletown at 7 A. M. and 4 40, P. M.; Goshen at 7 23, A. M. and 5 3, P. M.; Chester at 7 35, A. M. and 5 18, P. M.

Fare between New York and Otisville, \$1 50; way-fare in proportion.

For MILK—Leave Otisville at 5½ o'clock, morning and evening.

For FREIGHT—The barges "Samuel Marsh and Henry Suydam, Jr." will leave New York (from the foot of Duane St.) at 5 o'clock, P. M. daily (except Sundays.)

No freight will be received in New York after 5 o'clock, P. M.

Freight for New York will be taken by the trains leaving Otisville at 10½ o'clock, A. M.; Middletown at 11½, A. M.; Goshen at 12½, P. M.; Chester at 1 o'clock, P. M., etc., etc.

For farther particulars, apply to J. F. CLARKSON, Agent, corner of Duane and West Sts., New York, or to S. S. POST, Superintendent Transportation, Piermont.

H. C. SEYMOUR, Supt.

**WESTERN RAILROAD.—ON AND AFTER**  
Monday, April 5, 1847, the passenger trains will leave daily, Sundays excepted, as follows:

Boston at 8 a. m. and 4 p. m. for Albany.  
Albany at 7 1-4 a. m. and 5 p. m. for Boston.  
Springfield at 8 1-2 a. m. and 1 p. m. for Albany.  
Springfield at 8 1-2 a. m. and 1 1-2 and 3 p. m. (or on arrival of the train from New York) for Boston.

Day line to New York, via Springfield.—The steamboat train leaves Boston at 6 a. m., and arrives in New York at 7 p. m., by the steamboats Traveler, New York, or Champion. Returning, leaves New York at 6 1-4 a. m., and arrives in Boston at 7 p. m.

Night line to New York.—Leaves Boston at 4 p. m., and arrives in New York at 5 a. m.

Albany and Troy.—Leave Boston at 8 a. m., Springfield at 1 p. m., and arrive in Albany at 6 p. m.; or, leave Boston at 4 p. m., Springfield next morning at 8 1-2, and arrive in Albany at 1 1-2 p. m.

The Troy trains connect at Greenbush.  
The trains for Buffalo leave at 7½ a. m. and 7 p. m.  
For Northampton, Greenfield, etc.—The trains of the Connecticut River Railroad leave Springfield at 8 1-4 a. m., 1 and 3 p. m., and passengers proceed directly on to Brattleboro', Windsor, Bellows Falls, Walpole, Hanover, Haverhill, etc.

For Hartford.—The trains leave Springfield on the arrival of the trains from Boston.

The trains of Pittsfield and North Adams Railroad leave Pittsfield on the arrival of the trains from Boston.

N. B.—No responsibility assumed for any baggage by the passenger trains, except for wearing apparel not exceeding the value of fifty dollars, unless by special agreement.

JAMES BARNES, Supt. and Eng'r.

C. A. SEAD, Agent, 27 State street, Boston.

**BOSTON AND PROVIDENCE RAILROAD.** Passenger Notice. Summer Arrangement. On and after Monday, April 5, 1847, the Passenger Trains will run as follows:

Steamboat train via Stonington.—Leaves Boston every day, except Sunday, at 5 o'clock p.m.

Accommodation Trains—leave Boston at 7 and 10½ a.m. and 4 p.m., and Providence at 7½ and 10½ a.m. and 4½ p.m.

Dedham trains, leave Boston at 8 a.m., 12½, 3½, 6½ and 9 p.m., Leave Dedham at 7 and 9½ a.m. and 2½, 5½ and 8 p.m.

Stoughton trains, leave Boston at 11½ a.m. and 5½ p.m. Leave Stoughton at 7 10 a.m. and 3½ p.m.

All baggage at the risk of the owners thereof.

W. RAYMOND LEE, Supt.

**NEW YORK & HARLEM RAILROAD**  
CO.—Summer Arrangement.—On and after

Tuesday, June 1st, 1847, the cars will run as follows, until further notice. Up trains will leave the City Hall for—

Yorkville, Harlem and Morrisana at 6, 8 and 11 a.m., 2 30, 5 and 7 p.m.

For Morrisiana, Fordham, Williams' Bridge, Tuckahoe, Hart's Corner and White Plains, 7 and 10 a.m., 4 and 5 30 p.m.

For White Plains, Pleasantville, Newcastle, Mechanicsville and Croton Falls, 7 a.m. and 4 p.m.—Freight train at 1 p.m.

Returning to New York, will leave—Morrisiana and Harlem, 7, 8 20 and 9 a.m., 1, 3, 4 30, 6, 6 28 and 8 p.m.

Fordham, 8 08 and 9 15 a.m., 1 20 and 6 15 p.m.

Williams Bridge, 8 and 9 08 a.m., 1 10, 6 08 p.m.

Tuckahoe, 7 38 and 8 25 a.m., 12 55 and 5 52 p.m.

White Plains, 7 10 and 8 35 a.m., 12 50, 5 35 p.m.

Pleasantville, 8 15 a.m. and 5 15 p.m.

Newcastle, 8 a.m. and 5 p.m.

Mechanicsville, 7 48 a.m. and 4 48 p.m.

Croton Falls, 7 30 a.m. and 4 30 p.m. Freight train at 10 a.m.

Freight train will leave 32d street for Croton Falls and intermediate places, 4 a.m. and City Hall 1 p.m.

Returning, leave Croton Falls 10 a.m. and 9½ p.m.

ON SUNDAYS, the trains will run as follows: Leave City Hall for Croton Falls, 7 a.m., 4 p.m.

Croton Falls for City Hall, 7 30 a.m., 4 30 p.m.

Leave City Hall for White Plains and intermediate places, 7 and 10 a.m., 4 and 5 30 p.m.

White Plains for City Hall, 7 10 and 8 35 a.m., 12 30 and 5 35 p.m.

Extra trains will be run to Harlem, Fordham and Williams Bridge on Sunday, when the weather is fine.

The trains to and from Croton Falls will not stop on N. York island, except at Broome st. and 32d st.

A car will precede each train 10 minutes to take up passengers in the city.

Fare from New York to Croton Falls and Somers \$1, to Mechanicsville 87½c., to Newcastle 75c., to Pleasantville 62½c., to White Plains 50c. 25tf

**LONG ISLAND RAILROAD COMPANY.**  
Summer Arrangement. On and after Monday May 1st, trains will run as follows, except Sundays:

Leave—Brooklyn at 9 1-2 a.m. for Farmingdale, 1 1-2 p.m. for Greenport, at 4 p.m. for Farmingdale.

Leave Farmingdale at 7 a.m. for Brooklyn, 12 m. do., at 3 1-4 do. do.

Leave Greenport at 8 1-2 a.m. for Brooklyn.

Leave Jamaica at 8 a.m. for Brooklyn, at 1 p.m. do., at 4½ p.m. do.

On Saturdays, a train will leave Brooklyn for Yaphank, at 4 p.m. Leave Yaphank, on Mondays for Brooklyn at 5 1-2 a.m.

On and after May 15th, and until September 1st, 1847, a train will leave Jamaica at 7 a.m. for Brooklyn—leave Brooklyn at 6 p.m. for Jamaica, and will land and receive passengers at any place between Brooklyn and Jamaica.

On Sundays—leave Brooklyn at 8 1-2 a.m. for Farmingdale; leave Farmingdale at 4 p.m. for Brooklyn.

Freight Trains—leave Brooklyn at 10 a.m. for Greenport; leave Greenport at 12 m. for Brooklyn.

Baggage crates will be in readiness at the foot of Whitehall street, to receive baggage for the several trains, 30 minutes before the hour of starting from the Brooklyn side.

The steamer "Statesman," Captain Nash, leaves Greenport for Sag Harbor on the arrival of the Accommodation train from Brooklyn.

DAVID S. IVES, Supt.

**PATERSON RAILROAD**  
Summer Arrangement.

Commencing April 20th, 1847, the cars will leave

Paterson at New York at

8 o'clock a.m. 9½ o'clock a.m.

11½ o'clock a.m. 12 1-4 o'clock p.m.

4 o'clock p.m. 5½ o'clock p.m.

On Sunday, 9½ o'clock a.m.

8 o'clock a.m. 5½ o'clock p.m.

4 o'clock p.m. Office 75 Courtlandt St.

**BALTIMORE AND SUSQUEHANNA**  
Railroad.—Reduction of Fare. Morning and

Afternoon Trains between Baltimore and York.—The Passenger trains run daily, except Sunday, as follows:  
Leaves Baltimore at.....9 a.m. and 3 p.m.  
Arrives at.....9 a.m. and 6 p.m.  
Leaves York at.....5 a.m. and 3 p.m.  
Arrives at.....12 p.m. and 8 p.m.  
Leaves York for Columbia at.....1 p.m. and 8 a.m.  
Leaves Columbia for York at.....8 a.m. and 2 p.m.

**FARE.**  
Fare to York.....\$1 50  
" Wrightsville.....2 00  
" Columbia.....2 12½  
Way points in proportion.

**PITTSBURG, GETTYSBURG AND HARRISBURG.**

Through tickets to Pittsburg via stage to Harrisburg.....\$9  
Or via Lancaster by railroad.....3  
Through tickets to Harrisburg or Gettysburg.....3  
In connection with the afternoon train at 3 o'clock, a horse car is run to Green Spring and Owing's Mill, arriving at the Mills at.....5 p.m.  
Returning, leaves Owing's Mills at.....7 a.m.  
D. C. H. BORDLEY, Supt.  
Ticket Office, 63 North st.  
31 ly

**BOSTON AND MAINE RAILROAD.**  
Upper Route, to Portland and the East.

**SUMMER ARRANGEMENT,**  
April 1, 1847.

**PORTLAND TRAINS.**  
Leave Boston at 7 A.M. and 2½ P.M.  
Leave Portland at 7½ A.M. and 3 P.M.

**GREAT FALLS TRAIN.**  
Leave Boston at 5 P.M.  
Leave Great Falls at 6½ A.M.

**HAVERHILL TRAINS.**  
Leave Boston at 11½ A.M. and 6-20 P.M.  
Leave Haverhill at 6½ A.M. and 4½ P.M.

**READING TRAINS.**  
Leave Boston at 8½ A.M. and 8½ P.M.  
Leave Reading at 6 A.M. and 1½ P.M.

**MEDFORD BRANCH TRAINS.**  
Leave Boston at 7½, 11½ A.M., 2½, 5½, 7 P.M.  
Leave Medford at 6½, 8 A.M., 1½, 4½, 6 P.M.

The Depot in Boston is on Haymarket Square.  
Passengers are not allowed to carry Baggage above \$50 in value, and that personal, unless notice is given, and an extra amount paid, at the rate of the price of a Ticket for every \$500 additional value.

1y31 CHAS. MINOT, Supt.

**NORWICH AND WORCESTER RAILROAD.**  
Summer Arrangement. Change of

Hours. Commencing on  
Wednesday, April 21, 1847.

Accommodation Trains, daily, (except Sunday.)  
Leave Norwich, at 6 a.m., and 4 p.m. Leave Worcester, at 8½ a.m., and 4½ p.m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston, and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 2½ p.m. train from Boston.

New York Train via Steamboat.—Leave Norwich for Boston, every morning, except Monday, on the arrival of the steamboat from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 6½ p.m., daily, except Sunday, stopping at Danielsonville and Norwich.

Freight Trains daily each way, except Sunday.—Leave Norwich at 7, and Worcester at 6 30 a.m. Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are Less when paid for Tickets than when paid in the Cars.

J. W. STOWELL, Supt.

**PHILADELPHIA AND READING RAILROAD.**  
Passenger Train Arrangement for 1847.

A Passenger Train will leave Philadelphia and Pottsville daily, except Sundays, at 9 o'clock A.M.

The Train from Philadelphia arrives at Reading at 12 18 M.

The Train from Pottsville arrives at Reading at 10 43 A.M.

Fares.	Miles.	No. 1.	No. 2.
Between Phila. and Pottsville, 92		\$3.50 and \$3.00	
" " Reading, 58		2.25 and 1.90	
" Pottsville 34		1.40 and 1.20	

Five minutes allowed at Reading; and three at other way stations.

Passenger Depot in Philadelphia corner of Broad and Vine streets.

**PHILADELPHIA, WILMINGTON & BALTIMORE RAILROAD.—1847.**

**Summer Arrangement.**

Philadelphia for Baltimore...8 a.m. and 10 p.m.  
Baltimore for Philadelphia...9 a.m. and 8 p.m.  
Connecting with Mail Lines North, South & West.

On Sundays, only the 10 P. M. Lines run.

The Boat Lines, via Newcastle & Frenchtown R.R. Leave Philadelphia at 3½ p.m. No line on Sun.—Leave Baltimore at 3 p.m. day.

Accommodation Trains between Philadelphia & Wilmington.—Philadelphia to Wilmington, 8 a.m., mail, 12½ p.m., 4 p.m., 7 p.m., 10 p.m. mail. Wilmington to Philadelphia, 7 a.m., 1 p.m., mail, 4½ p.m., 7 p.m., 12½ a.m., night mail.

J. R. TRIMBLE,  
Engineer and General Superintendent.

**CONNECTION BETWEEN THE BOSTON and Lowell and the Boston and Maine Railroads.**  
On and after April

1st, 1847, passenger trains between these two roads, will run as follows, viz:

Leaving Lowell at 7, 11 1-4 a.m., and 2 1-2, 4 1-2, and 6 1-2 p.m., to connect at the junction in Wilmington with the eastward trains—at 7 a.m. and 2 1-2 p.m. with those to Portland; at 4 1-2 p.m. to Great Falls only, with a detention of 45 minutes at the junction, and at 11 1-4 a.m. and 6 1-2 p.m. to Haverhill only. Leaving the junction in Wilmington, for Lowell, at about 7 1-4 a.m. on arrival of the morning train from Haverhill; at about 9 a.m., on arrival of the morning trains from Great Falls. At about 11 3-4 a.m., on arrival of the morning train from Portland. At about 5 p.m. on arrival of the afternoon trains from Haverhill. At about 7 1-4 p.m., on arrival of the afternoon train from Portland.

WALDO HIGGINSON, Agent.

**NEW YORK AND PHILADELPHIA RAILROAD line—direct.**  
Via Newark, New Brunswick, Princeton, Trenton,

and Bristol. (Through in six hours.) Leaving New York daily from the foot of Liberty street.

Morning line.....9 o'clock a.m.  
Mail pilot line.....4½ " p.m.

The lines proceed direct to Bristol without change of cars, and thence by the new steamer, "John Stevens," to Philadelphia.

**FARE BETWEEN NEW YORK & PHILA.**

First class cars.....\$4 00  
Second class cars.....3 00

Passengers will procure their Tickets at the office foot of Liberty st., where a commodious steamboat will be in readiness with Baggage-crates on board.

Fifty pounds of baggage will be allowed to each passenger in this line, and passengers are expressly prohibited from taking anything as baggage but their wearing apparel, which will be at the risk of the owner.

Philadelphia Baggage-crates are conveyed from city to city, without being opened by the way. Each train is provided with a car, in which are apartments and dressing rooms expressly for ladies' use.

Returning, the lines leave Philadelphia from the foot of Walnut st. at 9 a.m. and 4 1-2 p.m.

The lines for Baltimore leave Philadelphia daily, except Sundays, at 8 a.m., 3½ and 10 p.m., and Sundays only at 10 p.m.—being a continuation of the line from New York.

**LITTLE MIAMI RAILROAD.—OPEN**  
TO SPRINGFIELD—Distance 84 miles—

connecting at Xenia and Springfield with Messrs. Neil, Moore, & Co's. daily daylight lines of stages going east and north, to Columbus, Zanewville, Wheeling, Cleveland, and Sandusky City, via Urbana, Bellefontaine, Kenton, and the Mad river and Lake Erie railroad, or Columbus, Delaware, and the Mansfield and Sandusky City railroad—forming, by these connections, the cheapest and most expeditious route to Buffalo, Niagara Falls, Rochester, Albany, New York, and Boston.

On and after Thursday, August 13, 1846, until further notice, a Passenger train will run as follows: Leave Cincinnati daily at 9 A. M., for Milford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Old Town, Yellow Springs, and Springfield.

Returning, will leave Springfield at 4 hours 35 minutes A. M. A line of Hacks runs in connection with the Cars, between Deerfield and Lebanon.

**FARE—From Cincinnati to Lebanon....\$1 00**  
" " " Xenia.....1 50  
" " " Springfield...2 00  
" " " Columbus...4 00  
" " " Sandusky city 8 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at of a passage for every \$500 in value over that amount.

The 1½ P. M. train from Cincinnati, and the 2 40 P. M. train from Xenia, will be discontinued on and after Monday, the 10th instant.

A freight train will run daily.

47½ W. H. CLEMENT, Supt.

**BALTIMORE AND OHIO RAILROAD.**  
MAIN STEM. The Train carrying the

Great Western Mail leaves Bal-

timore every morning at 7½ and Cumberland at 8 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburgh and Hancock, connecting daily each way with—the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Pittsburgh. Time of arrival at both Cumberland and Baltimore 5½ P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pittsburgh \$10, and time about 32 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$12. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

**WASHINGTON BRANCH.**

Daily trains at 9 A. M. and 5 P. M. and 19 at night from Baltimore and at 6 A. M. and 5½ P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances.

**LEXINGTON AND OHIO RAILROAD.**  
Trains leave Lexington for Frankfort daily,

at 5 o'clock a.m., and 2 p.m.

Trains leave Frankfort for Lexington daily, at 8 o'clock a.m. and 2 p.m. Distance, 28 miles. Fare \$1.25.

On Sunday but one train, 5 o'clock a.m. from Lexington, and 2 o'clock p.m. from Frankfort.

The winter arrangement (after 15th September to 15th March) is 6 o'clock a.m. from Lexington, and ma. 9. from Frankfort, other hours as above. 35ly

**CENTRAL AND MACON AND WESTERN** Railroads, Ga.—These Roads with the Western and Atlantic Railroad of the State of Georgia, form a continuous line from Savannah to Oothcaloga, Ga., of 371 miles, viz:

Savannah to Macon—Central Railroad ..... 190  
Macon to Atlanta—Macon and Western ..... 101  
Atlanta to Oothcaloga—Western and Atlantic .. 80

Goods will be carried from Savannah to Atlanta and Oothcaloga, at the following rates, viz:

	To Atlanta.	To Oothcaloga.
On Weight Goods—Sugar, Coffee, Liquor, Bagging, Rope, Butter, Cheese, Tobacco, Leather, Hides, Cotton Yarns, Copper, Tin, Bar & Sheet Iron, Hollow Ware & Castings.....	\$0 50	\$0 75
Flour, Rice, Bacon in Casks or boxes, Pork, Beef, Fish, Lard, Tallow, Beeswax, Mill Gearing, Pig Iron and Grind Stones.....	0 50	0 62 1/2
On Measurement Goods—Boxes of Hats, Bonnets and Furniture, per cubic foot.....	0 20	0 26
Boxes and Bales of Dry Goods, Saddlery, Glass, Paints, Drugs and Confectionary, per cubic foot.....	0 20 or 100lbs. 35	
Crockery, per cubic foot.....	0 15 "	" 35
Molasses and Oil, per hhd., (smaller casks in proportion).	9 00	12 50
Ploughs, (large,) Cultivators, Corn Shellers, and Straw Cutters, each.....	1 25	1 50
Ploughs, (small,) and Wheelbarrows.....	0 80	1 05
Salt, per Liverpool Sack.....	0 70	0 95

Passage—Savannah to Atlanta, \$10; Children, under 12 years of age, half price, Savannah to Macon, \$7.

Goods consigned to the subscriber will be forwarded free of Commissions.

Freight may be paid at Savannah, Atlanta or Oothcaloga.

F. WINTER, Forwarding Agent, C. R. R. Savannah, Aug. 15th, 1846. 1y34

**CENTRAL RAILROAD—FROM SAVANNAH** to Macon. Distance 190 miles.

This Road is open for the transportation of Passengers and Freight. Rates of Passage, \$8 00. Freight—On weight goods generally... 50 cts. per hundred. On measurement goods ..... 13 cts. per cubic ft. On brls. wet (except molasses and oil).....\$1 50 per barrel. On brls. dry (except lime).... 80 cts. per barrel. On iron in pigs or bars, castings for mills, and unboxed machinery..... 40 cts. per hundred. On hds. and pipes of liquor, not over 120 gallons.....\$5 00 per hhd. On molasses and oil.....\$6 00 per hhd. Goods addressed to F. WINTER, Agent, forwarded free of commission. THOMAS PURSE, y40 Gen'l. Sup't. Transportation.

**SOUTH CAROLINA RAILROAD.—A** Passenger Train runs daily from Charleston,

on the arrival of the boats from Wilmington, N. C., in connection with trains on the Georgia, and Western and Atlantic Railroads—and by stage lines and steamers connects with the Montgomery and West Point, and the Tusculumbia Railroad in N. Alabama.

Fare through from Charleston to Montgomery daily.....\$26 50

Fare through from Charleston to Huntsville, Decatur and Tusculumbia.....\$2 00

The South Carolina Railroad Co. engage to receive merchandize consigned to their order, and to forward the same to any point on their road; and to the different stations on the Georgia and Western and Atlantic railroad; and to Montgomery, Ala., by the West Point and Montgomery Railroad.

JOHN KING, Jr, Agent. 1y25

**GEORGIA RAILROAD. FROM AUGUSTA** to ATLANTA—171 MILES.

AND WESTERN AND ATLANTIC RAILROAD FROM ATLANTA TO OOTHCALOGA, 80 MILES.

This Road in connection with the South Carolina Railroad and Western and Atlantic Railroad now forms a continuous line, 388 miles in length, from Charleston to Oothcaloga on the Oostenaulla River, in Cass Co., Georgia.

RATES OF FREIGHT.		Between Augusta and Oothcaloga and Dalton. 50 miles.	Between Charleston, Oothcaloga and Dalton. 55 miles.
1st class.	Boxes of Hats, Bonnets, and Furniture, per cubic foot.....	\$0 16	\$0 26

	Salt per bushel.....	0 17	
	Salt per Liverpool sack.....		95
	Ploughs, Corn Shellers, Cultivators, Straw Cutters, Wheelbarrows....	0 75	1 37

German or other emigrants, in lots of 20 or more, will be carried over the above roads at 2 cents per mile.

Goods consigned to S. C. Railroad Co. will be forwarded free of commissions. Freight may be paid at Augusta, Atlanta, or Oothcaloga.

J. EDGAR THOMSON,  
Ch. Eng. and Gen. Agent.  
Augusta, Sept. 2d, 1846. \*44 1y

**GREAT SOUTHERN MAIL LINE!** VIA Washington city, Richmond, Petersburg, Weldon and Charleston, S. C., direct to New Orleans. The only Line which carries the Great Southern Mail, and Twenty-four Hours in advance of Bay Line, leaving Baltimore same day.

Passengers leaving New York at 4 1/2 P.M., Philadelphia at 10 P.M., and Baltimore at 6 1/2 A.M., proceed without delay at any point, by this line, reaching Richmond in eleven, Petersburg in thirteen and a half hours, and Charleston, S. C., in two days from Baltimore.

Fare from Baltimore to Charleston.....\$21 00  
" " " Richmond..... 6 60

For Tickets, or further information, apply at the Southern Ticket Office, adjoining the Washington Railroad Office, Pratt street, Baltimore, to 1y14 STOCTON & FALLS, Agents.

**THE WESTERN AND ATLANTIC** Railroad.—This Road is now in operation to Oothcaloga, a distance of 80 miles, and connects daily (Sundays excepted) with the Georgia Railroad.

From Kingston, on this road, there is a tri-weekly line of stages, which leave on the arrival of the cars on Tuesday, Thursday and Saturday, for Warrenton, Huntsville, Decatur and Tusculumbia, Alabama, and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga for Chataanooga, Jasper, Murfreesborough, Knoxville and Nashville, Tennessee.

This is the most expeditious route from the east to any of these places.

CHAS. F. M. GARNETT,  
Chief Engineer.  
Atlanta, Georgia, April 16th, 1846. 1y1

## FRANKLIN HOUSE,

No. 105 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,  
D. K. MINOR.

## BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,

105 Chestnut Street,

PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS.—Five Dollars a year, in advance.

### A Substitute for Oil in Machinery.

Experiments are being tried upon the New Jersey railroad to test the merits of a substitute for oil on the axles of the cars. The substitute used is cold water. It is applied to the axletree by means of a small wheel, armed with buckets, and enclosed within the box that confines the end of the axle and contains the water. Its operation is similar to that of the trough of water under the grindstone, and the greater the velocity of the wheel, so much the more completely is the end of the axle buried in water.—The New York Post says:

"After running the car to which it is applied, 15 miles, for instance, at the high speed of a swift train, we found the water in the box as cold as when it was put there, the end of the axle was without any perceptible degree of heat, and the water had no more discoloration than might have been caused by the dust in the box. Fifteen miles, run at high speed, was sufficient to test the experiment, and such were the results. The principle upon which the patentee bases this application of cold water is, that the heat or electric influences formed at the extremities of the axle are dissipated or conveyed away by the water, just as the atmosphere and the rain convey the electricity of the heavens to the earth. In an economical point of view, the successful application of water to machinery as a substitute for oil will save to the State of New York annually, as it is estimated, nearly two hundred thousand dollars."

### Anthracite Coal Burning Engines.

We understand that Mr. Ross Winans, of Baltimore, has, with an engine of his construction, completed several very successful trips over the Beading railroad, with the entire use of anthracite coal as a fuel. The loads carried, as well as the time expended in taking trains over this road have been quite equal to the best performances made by their wood burning engines. On Friday last we understand she took a train of 90 loaded cars from Schuylkill Haven to the Falls Bridge, 84 miles, in 10½ hours, this is considered better than an average trip for the engines on this road.

Mr. Winans has long labored to perfect the burning of coal in locomotive engines, and for several years past has been building engines for the Baltimore and Ohio railroad company, which burn with complete success the bituminous coal of the region traversed by that road. The success of his engines on the Reading railroad will doubtless add to his well-earned reputation as an engineer, and be a source of much gratification to all railroad companies desiring to make use of anthracite coal as a fuel. We hope soon to be able to lay before our readers a full account of this engine.

### Newcastle and Wilmington Railroad.

We find the following advertisement in the *North American* of this morning, accompanied by an appropriate notice. We give them a place in the Journal, in the spirit of doing a service to the cause, and in the hope of promoting this particular object, as we consider it a very important one.

**NOTICE.**—The undersigned, Commissioners appointed by an Act of the Legislature of the State of Delaware, to receive subscriptions to the Capital Stock of the "NEWCASTLE AND WILMINGTON RAILROAD COMPANY," hereby give notice, that books will be opened for that purpose on MONDAY, the fifth day of July next, at 10 o'clock, A. M., at the Exchange, in the city of Philadelphia, at the Hotel of John Hall, in the city of Wilmington, and at the Hotel of Isaac H. Register in the town of Newcastle.

JOHN A. BROWN,  
J. C. DU PONT,  
PHILIP REYBOLD,  
WILLIAM COWPER,  
ELIHU JEFFERSON,  
ANDREW C. GRAY.

June 29, 1847.

The editor of the *North American* says, "We invite attention to the advertisement in another column, of the Commissioners of the Newcastle and Wilmington Railroad Company, noting their intention to open the books to receive subscriptions on

Monday next, at Newcastle, Wilmington and Philadelphia. The project of this road appears to be of considerable interest to our business men of Philadelphia, and we might add to our friends in Wilmington, as it will complete an important connection for the commerce of both with the winter harbor at Newcastle. It is believed that it will prove of value as a lateral route or feeder to the Wilmington and Baltimore Railroad. The whole route is described as being of less than four miles in extent, and over excellent ground for the purpose."

### Strawberries and Milk.

A letter from H. C. SEYMOUR, Esq., superintendent of the New York and Erie Railroad, to Mr. Marsh, the Secretary, says:

"The milk train of Tuesday night (22d instant) took to New York 80,000 baskets of strawberries. These baskets are intended to contain one pint each; but say that three baskets contain one quart, which is quite within bounds. Then we had 26,667 quarts or eight hundred and thirty-three bushels. These strawberries will no doubt weigh 65 pounds to the bushel, but say 60, then we had twenty-five tons of strawberries alone. The boxes and baskets weigh as much more, so that the freight was at least fifty tons. By the same train we had 28,000 quarts of milk, which weigh (a pint a pound) twenty-eight tons, and including cans, 35 tons; making a freight of eighty-five tons of strawberries and milk. The milk by both our trains equals fifty tons (50,000 quarts) daily; and including cans, 63 tons. The Rockland county people receive nearly \$3,000 a day for their strawberries."

The New York Journal of Commerce remarks—"The value of such an avenue of communication to the city, can scarcely be estimated. It gives us the good things of the country in cheapness and abundance."

On Thursday, the 24th, 52,492 baskets of strawberries were received in New York by the Erie Railroad.

Twenty-eight thousand quarts of milk per day is ten million, two hundred and twenty thousand quarts a year, which, at six cents a quart—the average price previous to the opening of the New York and Erie Railroad—amounts to \$613,200 per year, for an inferior article; but since the opening of this road the average price of good milk has been four cents—making an annual saving of \$204,400 to the people of the city on milk alone!! to say nothing of the strawberries."

If such advantages result to the city from one item of provisions, when the road is only one-fifth completed, what may not be anticipated when the

communication is opened to the lake and to the fruitful west? Who can estimate them? The economy of living and of transportation alone will be equal, in five years, to the entire cost of the road, even if it exceeds ten millions of dollars.—[Ed. R. R. Journal.]

#### Harlem Railroad.

The President and Directors of the New York and Harlem Railroad, accompanied by several members of the press, made a trip to Croton Falls on Monday, June 1, to celebrate the opening of their road to Somers. In spite of the unpleasant weather the trip was an interesting one. The road is now completed to Croton Falls, fifty-two miles from the City Hall terminus. The road from White Plains to Croton Falls is equal to any in the Union, being laid with the T rail. The Directors intend laying a double track from Harlem to Williams' Bridge, to which point the road will be immediately completed. At Williams' Bridge it will be intersected by the New Haven road. At present four trains, two for passengers and two for freight, pass over the road daily, one of each in the morning and one at evening. The amount of travel and freight is already considerable, and especially of produce brought in from Westchester and Orange counties.

The future prospects of the road are flattering, and passing as it does through a delightful country within four miles of Mayapoc and the Croton Dam, two favorite summer resorts, it must induce a large share of travel. A fine dinner was served up for the jaunt at Croton Falls, and the whole company returned in the evening to the city, highly pleased with their trip and the capabilities of the road.

We are glad to know that our esteemed fellow-citizen, CHARLES PASHALL, Esq., has recently been elected President of the Company.

#### Atmospheric Railway.

"In another column," says the editor of the Mining Journal of May 22d, "will be found a description of *Clarke and Varley's Resilient Atmospheric Railway Tube*, with some remarks on the working of the experimental line of 450 feet of a 15 inch tube, now in operation daily near the Poplar Station on the London and Blackwall railway. Among several hundred gentlemen, connected with railways and scientific pursuits, who have already inspected this splendid model, we understand not a single objection of moment has been even raised against the principle—its merits being so evident to the casual observer, and affording the most convincing proofs, that whatever difficulties and objections the atmospheric principle has had to struggle against, it has arisen from an erroneous form of construction, and that the system under notice leaves nothing to be desired. To those who are aware of the continuous difficulties which have been, and are met with on the lines of railway which have been constructed on the atmospheric principle in continuing a vacuum, it will be surprising when we inform them that with only one valve of one air-pump at work, an exhaustion of half an inch of mercury, or about one-quarter of a pound pressure per inch on the piston is sufficient to start the carriage, with the passengers it contained, weighing nearly three tons; and that, on rising the incline of 1 in 60, the pressure never exceeds one pound per square inch. Of course, the speed was slow; but these experiments were made to show the extraordinary small amount of friction, and the absolute freedom from leakage which must exist in the tube, or such results could not be obtained. Indeed, although the patentees, and all who have watched the progress of the improvements

which have been gradually making in the construction of the continuous opening in the tube, during the past three years, expected the most favorable results, they have been completely astonished at the perfection which the model exhibits, now it is in full working order. The patentees invite the most searching investigation, and an inspection will well repay the trouble of a visit."

#### Seaboard and Roanoke Railroad.

The Norfolk Herald states that the Trustees of the Town of Portsmouth have purchased the Portsmouth and Roanoke Railroad from the Board of Public Works of Virginia, under the act passed at the last session of the Legislature, for the \$50,000, upon a credit of six years, and that they have sold the road to Messrs. Henshaw & Co., of Boston. The new company will immediately lay down T rails from Portsmouth to Weldon, and will also extend the road thirteen miles further in order to connect with the Raleigh and Gaston Railroad.

#### Niagara and Detroit Railroad.

In the Legislature of Canada last Friday evening, there was an animated discussion on this bill. For the second reading 34, against it 19—the members of the Government being all in the minority.

#### An Old Engine.

This "old fellow" holds his own well, and shows that he came of a good stock.

"There is now in full work, at the Tredegar Old Mill Iron Works, a steam engine which was erected by Boulton and Watt, upwards of 40 years ago, and is now nearly as good as ever. A few weeks ago it turned out, between one o'clock on a Monday morning and eleven o'clock on the following Saturday night, no less than 566 tons of rails, rolled and finished, and 289 tons of puddled bars—total, 855 tons."

#### Institutions for the Promotion of Science.

We have copied largely from the proceedings of a new institution for the promotion of mechanical science, recently established in Birmingham. The proceedings of this new society, or "Institution," are thus spoken of by the editor of the Mining Journal.

"The success of institutions, established for the promotion of scientific knowledge, is at all times highly gratifying to every one who takes an interest in the progress of human advancement, and the improvement of the arts to the wants and comforts of life. The report of the proceedings of the meeting of the members of the Institution of Mechanical Engineers, held at Birmingham on Monday last, will be read with interest, as recording the fact of its being now securely established, and bids fair to be, for the central metropolis of this engineering country, what the Institution of Civil Engineers is to London—patronised by Mr. Robert Stephenson, and supported by a host of influential parties in the midland counties. Several papers on important subjects were read at this, their second meeting, which augurs well for their future career—by Mr. Buckle, on the Use of Fan Blast, as applied to Manufacturing Purposes; another paper by Mr. Jones, of the Bridgewater Foundry, on the same subject, on which an interesting conversation ensued, relative to its application to the smelting of metals; one by Mr. J. Wilkinson, on the Economy arising from Introducing Heated Air into the Boiler of the Steam Engine; and by Mr. Crawford, of Birmingham, on an Improvement on Railway-carriage Brakes. The whole proceedings were highly satisfactory and encouraging, and the formation of the institution will give an opportunity to many engineers and manufacturers recording their improvements and inventions at the meetings in Birmingham, when it might be inconvenient to attend at the Institution of Civil Engineers in London. We heartily wish them every success.

#### THE MINING JOURNAL

AND AMERICAN RAILROAD GAZETTE.

A new candidate for public favor, with the above attractive title, recently made its appearance in New York, and a number was sent to us for our inspection, and "exchange," but before we had an opportunity of examining it—so interesting was it found—some one, interested in mining operations perhaps, availed themselves of a too common custom at hotels, and in editorial closets, and appropriated it to their own use, and thus compelled us to write to the editor for another copy which was duly received, but at a period too late for our last number. In size and appearance it very much resembles that excellent work—the "London Mining Journal." This, the first number, is of course made up with much care. Its introductory article is well written, and its correspondence and selections are extensive and interesting; and it bids fair to become a useful laborer in the cause. We therefore give to it the right hand of fellowship, and wish it, editor, proprietor and mining friends, God-speed.

That our readers may judge of its objects and claims, we give its leading article entire, and make several other selections from it, and now give notice that we shall make free use of its contents when we find them in our line and to our mind.

The editor, Mr. John E. Grant, says in his introductory article that—"In presenting the first number of THE MINING JOURNAL to the public, we shall make a few remarks to enable our readers to judge for themselves of the merits of the enterprise, and the value and usefulness of the paper. We intend and hope to make it useful to our readers and profitable to ourselves. We propose to make no promises we cannot perform, nor awaken expectations we cannot satisfy. Aware that we are entering upon the discharge of a difficult and laborious duty, we must bespeak the kind indulgence of our patrons, tendering to them the assurance that our efforts shall ever be directed to make this Journal all that we herein propose to make it, and to add to its usefulness, from time to time, as larger experience and more thorough knowledge of the wants of the mining and kindred interests of the country shall enable us to do it.

"The paper will be devoted to the subject of mines and mining metals and minerals, and in other respects conducted upon the plan, (so far as we are able to adopt it,) of the celebrated Mining Journal and Railroad Gazette, of London. Attention, of course, will be given to the smelting and manufacture of minerals and metals when raised from the mines. All mines, whether of iron, lead, copper, silver, gold, coal, etc., will receive attention; the various modes of smelting metals, or working or manufacturing them, and the most approved methods of working, alloying, or using them by chemical or other means used in the arts, will be treated of in our columns by ourselves and others, with care and impartiality.

"In former times, and in a different state of society from that which now exists, when the whole circle of the useful arts was within the geographical limits of less than one-half of the eastern continent, and animal power was used for most of the purposes of transportation, but a small comparative amount of metals was required for the uses of human life. The discovery of this continent, the introduction of a more intelligent and higher civilization, the discovery of steam power, and the various inventions and improvements which have followed, upon land and sea, have produced wonderful changes in the business of the world, and extended widely

the uses of the metals in the service of mankind. In iron and lead, the reduced price shows that the supply has kept pace with the demand, while in copper the advanced and still advancing price gives evidence that the demand has increased upon the supply. Many of our citizens will recollect the time when most, if not all the iron and lead used in the United States was imported from other countries, and with what suspicion and fear our citizens embarked in any enterprise which had for its object the mining and smelting of those metals. The wonderful discoveries of lead on the Upper Mississippi, and the immense quantities mined and manufactured, have astonished all who have given attention to the subject, either in Europe or America. The immense deposits of iron ore, in various parts of the United States, and the discoveries continually being made, are not less surprising; and if not so much now the subject of remark as formerly, it is because the public ear has become so familiar with the reports of new discoveries that they have lost their public interest. The fact of a discovery of a mountain of iron ore, an ore-bed covering thousands of acres, or a coal field extending scores of miles, now creates but little attention and no excitement.

"The discovery of the immense deposits of copper in the region of country bordering on Lake Superior at first attracted some attention, and afterwards created considerable excitement; but the excitement over, the fact of their existence was added to the many evidences of the great mineral wealth of this country. The development of these mines is left now to private enterprise and ingenuity, and promises profitable rewards. To aid that portion of our fellow citizens who are, or who may be hereafter engaged in exploring for, locating and working these mines, we shall place before them full and correct information as to the discoveries of new mines, the annual yield of these discovered, the improvements made from time to time in tools and machinery used in the mines, the discoveries of new, and the improvements of old, methods of smelting and manufacturing the metal, and the new purposes to which the metal has been or can be applied.

"It is our intention to give considerable space in the Journal to the construction of railroads and steam engines, and other machinery of which metals may form any considerable part.

"The information we are able to obtain, from time to time, from the European mines, the value of ores and metals there, the value of stocks, reports from mining companies and mines, when the same are made public, will be given; and in general the diffusion of such correct information as may be thought useful or instructive to those engaged in mining or connected with mining interests, will be the object of THE MINING JOURNAL AND AMERICAN RAILROAD GAZETTE."

#### Night Telegraph.

At a meeting of the Scottish Society of Arts, on the 26th of April, a communication was read by Mr. J. Stewart Hepburn in relation to "Night Telegraphs by colored lights."

This telegraph consists in the employment of various combinations of the only two colors, red and white, which are distinctly visible at considerable distances. This is effected by the use of a lamp, enclosed in a hexagonal screen, which revolves horizontally on pivots; four of the compartments being opaque, and two furnished with lenses, one red, the other colorless. By the turning of the screen the light can either be masked or shown of a red or white color as the particular combination may require. Three such lamps are hung

on pivots on an arm or beam 15 or 20 feet in length, turning vertically on its centre on an upright post, and made to assume four definite positions, horizontal, vertical, and diagonal, rising from the left or falling from the left. The different positions of this arm, together with the varieties in color and order given to the lights by this construction of the lamps, afford at least fifty distinct combinations, to which numbers, or the letters of the alphabet, and arbitrary significations adapted to the particular uses of the telegraph, may be assigned.

At the same meeting was also read a "description of a new method of overcoming an Incline of 1 foot in 12, with a new Locomotive Reversing Steam Engine." By Mr. DANIEL ERSKINE.

In addition to the small wheels keyed on the axle outside of the usual large wheels of locomotives, and connected by connecting rods, Mr. Erskine has a toothed pinion on each side of the engine, dropping down between the flange of the small wheels and the large wheels, which, on the locomotive coming to a steep incline, say 1 foot in 12, works into strong pins or bolts, fixed on the inside of the raised rail. The engine and carriages all the while running on the small wheels, by which their whole weight is borne, and the large wheels acting as fly-wheels, leaving the toothed pinions nothing to do but to work in gear with the pins or bolts, thereby effectually preventing slipping. It was shown, by a beautiful working locomotive of about 9 lb. weight, made by Mr. Erskine, and fitted with his reversing pivot valve, that by this means it easily ascended an incline of 1 foot in 10; and on an incline of 1 in 16, the small wheels themselves, without the toothed pinion, easily accomplished the ascent; whereas the engine could not attempt the ascent with its ordinary larger wheels. It was stated that this is not the first time a rack and pinion has been proposed on the inclines of railways, but that it has never been proposed in the way now done by Mr. Erskine, by whose method the power is so vastly increased by being brought to act so near to the centre of the wheel.

#### Atlantic Screw Propeller.

At the meeting of the Institution of Civil Engineers, London, May 18, a paper was read by Mr. J. Grantham, entitled "an account of the Sarah Sands, and other Iron Vessels, with direct-acting Auxiliary engines and screw-propellers."

The object of the paper was to show, that a propeller might be constructed of such dimensions that the number of revolutions it would require to make in order to obtain a high velocity would not much exceed that of the ordinary paddle-wheel, and that hence the usual marine condensing engine might be applied direct to the propeller shaft, without the intervention of a secondary motion. It appeared from the statements in the paper, that this opinion was found to be correct, and that Woodcroft's expanding pitch screw-propeller was the best form that had hitherto been employed. In a paper read to the Institution, upwards of three years since, Mr. Grantham gave his views on this subject, and several vessels had been since built—the results of the trials of which were communi-

cated to the meeting. The principal of these were the *Emerald* and *Diamond*, three-masted steamers, of 400 tons, and 60 horse power; the *Nautilus*, of the same dimensions; the *Antelope*, of 600 tons, and 100 horse power; and the *Sarah Sands*, of 1000 tons, and 180 horse power. Drawings of these vessels were exhibited to the meeting. The capabilities and performance of these vessels were described in the paper, but particular notice was taken of the last named vessel, which had performed a most successful voyage to New York during bad weather, and adverse winds. The passages made by the ordinary New York liners, which were out at the same time, were very long, averaging 48 days each, and the Boston and Liverpool steamers were much longer than usual on their passage. The *Sarah Sands* used her steam about 17 days, and sailed the remainder, making her voyage in 20 days 10 hours. On her arrival she had about enough fuel remaining for four days' steaming. The paper did not enter minutely into the particulars of the screw itself, as it was considered that too much attention had been given to that branch of the subject to the exclusion of the consideration of the plans for working it, which, after all, had been the stumbling-block to the general adoption of the system. It was necessary with the screw, the theory of which, as a propeller, was so little understood, to proceed with experiments perseveringly in one direction, as variations in the results were frequently attributed to causes which really did not exist. After describing several interesting details, the paper concluded by expressing a desire that engineers should examine the drawings of the system laid before the meeting, and endeavor to add to the stock of information already obtained.

After the paper was read, Mr. Grantham added some facts which he had recently gathered, and which strongly confirmed what had been stated. The *Diamond* had recently made a very rapid passage to Madeira, deeply laden; but, during the whole passage, the engines maintained a very moderate speed, and quite removed the impression that under such circumstances they would run too fast from their being connected directly to the screw.

An account of the last successful voyage of the *Sarah Sands* was also given, and it appeared that, in spite of most severe gales, which had driven back almost all other vessels, her passage had been made in the most satisfactory manner. In the discussion which followed, several engineers of eminence expressed themselves much pleased with the facts brought forward in the paper, and perfectly concurred with the views put forth. The principle of the following current of the ship, which had a material influence in increasing the efficiency of the screw, was alluded to, and a conviction was expressed that the screw would eventually supersede all other means of propelling vessels on long voyages.

An account was given also of the auxiliary screw steamers that ply between London and Rotterdam, and some interesting facts

were given of the power which these vessels possessed of working to windward in bad weather. The subject was closed by a discussion upon several points that had been started, relative to the size of the screw, the mode of disengaging it, and the prospects which were held out of the final success of the principle.

#### Mining on Lake Superior.

We find the following remarks upon this subject in the Mining Journal recently established in New York. They are well worthy of attention from those who have a desire to embark in the business.

"The remarkable discoveries made in the section of country in the vicinity of Lake Superior, has excited a considerable share of the attention of those engaged in mining. There has been, no doubt, much exaggeration in many of the statements made, in relation to the discoveries, and the speculation in mining stocks was pushed to an extent unwarranted by the actual state of affairs. In the fervor of excitement, when every returning visiter to the country brought information of new and astonishing discoveries of veins of pure copper, of great width and of unknown length with here and there rich specimens of pure native silver, suggesting the promise of immense deposits of that metal, it was not strange that the sober second thought idea as to the correctness of the reports and the title to the land, should be overlooked for the moment. Nor was it strange that when the excitement was over, and the fact established that without the action of congress, no title could be obtained to the lands, that the depression should be as great as the excitement had been high. Time and more numerous thorough examinations have now established the fact, that in all human probability, the Lake Superior region of country, including the north and south shores, far exceeds in richness and mineral value, any section of equal extent in any other country. The laws passed at the last session of congress, ordering the sale of mineral lands on Lake Superior, and giving pre-emption right to actual occupants, has placed the subject in a different light, and in a tangible shape. Investments can now be made with security, so far as the title to the land is concerned, and the capitalist who invests his money, and is successful in doing it upon a good mine, can rest secure in the certainty that whatever he may find, be it ever so valuable, will be his own. The facilities for transportation and travel have diminished, if not the distance, the time necessary to overcome the distance, so that the Lake Superior country may be said to be almost at our doors.

By the arrangements now made, and in progress, the passage from New York to Copper Harbor, can be made in from five to six days, at an expense but little exceeding thirty dollars; and contracts for the delivery of ore, in any quantity, at New York or Boston, from any point on the lake shore, below the mouth of the Ontonagon, can be made at from fifteen to twenty dollars per ton. We think we are safe in saying that, taking into consideration the extraordinary salubrity of the climate—the immediate vicinity of the mines to water communication—the richness

of the veins, and their proximity to the surface—the position of many of the mines in elevated situation, convenient for draining—the large amount of wood and timber suitable for coal and fuel, in the immediate vicinity of the mines—the Lake Superior country offers greater facilities for a profitable working of mines than can be held out by any other country on the globe. The expense of transporting, from points on Lakes Erie and Michigan, the provisions necessary for the workmen at the mines, the increased prices of labor, and the extra expenses incident to all new undertakings, will no doubt operate as a serious drawback upon the profits for a few years; but as the country in the vicinity of the mines becomes settled by an agricultural population, and the knowledge of the mines has become extended so as to induce immigration from foreign miners, these obstacles will be overcome.

But, after all, we do not intend to urge our readers to embark with a rush in mining in the Lake Superior country. The business is a new one to most of those engaged in it, and in all cases experience is the best and safest guide. We would suggest, then, to those engaged in mining, the expediency of moving, in the first instance, with care, employing but a small force at a time until a thorough examination of the position and value of the veins and ores contained in them, has determined the best point to drive the drifts or sink the shafts. To those who propose to invest in the mines, we would suggest the policy of dividing the investments among several mines, always exercising due care to ascertain the present prospects and value of each mine.

The management of the mine, too, is a matter of great moment, as the mere fact of having a good mine will be of but little importance, if the labor is misdirected, and the money lost by improper, careless, or bad management. We suggest a division of the investments among several mines, from the belief that discoveries of silver thus far, go to warrant the expectation that deeper explorations will result in the discovery of rich deposits of silver. This may not, and probably will not, occur in all the mines, but is very likely to happen in some; and as most of the mines have more or less silver in them, it is as likely to occur in one mine as in another. By a division of interest among several mines, the chance of obtaining a silver mine is increased.

The money must be made by a skilful working of the mines, and by raising the greatest amount of metal with the least possible expense; but a large amount of money will be made, incidentally, by the rise of stocks, caused by the increase of value in the mine. As a general rule, then, the purchase of stocks in mines just opening, and when the prices will be low, although attended with some more risk, will no doubt be as good an operation as the investment, at high prices, in older mines. Even in the present crude state of knowledge upon the subject, it is not difficult to determine as to the promise of a vein,—and the purchaser of stocks in any

mine should be correctly informed as to the appearance of the vein.

#### Gun Cotton for Blasting.

This new article seems to be attracting much attention. Numerous experiments, in comparison with gunpowder, have been made for blasting in tunnels and on other works, which should be understood by railway engineers and contractors—therefore we extract freely from our English Journals in relation to it. The following is from the Railway Chronicle of 29th May.

On the 20th of May, Mr. Wheeler, as representative of the Messrs. Hall, gunpowder manufacturers, and proprietors of the patent for Schonbein gun cotton, attended in Birmingham for the purpose of testing the comparative powers of gun powder and gun cotton in the mining operations of the Birmingham, Wolverhampton and Stour Valley required for the tunnel at present in progress under the town. The following is a brief description of the state of the tunnel and of the result of the experiments:

The length of the tunnel when completed will be about 850 yards, extending from Suffolk street to the canal, at the Crescent, all through the new red sandstone. At the Suffolk street end, about 40 yards have been completed, and two lengths have been got out by open cutting. In the excavation of this open cutting, one series of experiments was made. At a distance of a third of the length of the tunnel from this end, a shaft has been sunk in the old canal wharf, as also an air shaft, and at this shaft about 100 yards have been completed. Another shaft has been sunk at Bingley, and a heading had been commenced, but in consequence of complaints from parties in the neighborhood that their property was injured by the vibration caused by the blasting, the directors had stopped the operations, to try what other means less objectionable could be adopted. The first experiment was tried at Bingley, where two holes of equal size were driven, and charged—one with eight ounces of gun cotton, and the other with fifty ounces of gunpowder. The effect of the two was nearly alike, but the noise and vibration from the gun cotton were far less than from the powder. At the open cutting two experiments were tried; two holes, each 5 feet 6 inches deep, were loaded—one with ten ounces of cotton, and one with fifty ounces of powder. In this case, the noise and vibration were less from the cotton, but the ground displaced by the powder much greater than by the cotton.

Again; two holes, each 5 feet 6 in. deep, were charged—one with fifteen ounces of cotton, and one with sixty-three ounces of powder; and in this case the cotton displaced a much greater amount of ground than the powder. It should be remarked, that at the open cutting, the rock being so near the surface, is of a much less firm character than at the other points, where the rock is 50 or 60 feet below the surface. In the canal wharf the holes were 4 feet deep for the cotton and 5 feet 3 inches deep for the powder, and the charges sixty-three ounces of powder and thirteen of cotton. The cotton displaced less than the powder. In all cases the vibration

and noise from the cotton was less than from the powder, with this additional advantage, that as no smoke resulted from the cotton the miners were able to resume their work immediately after the shot, which is seldom the case with powder, especially in dull weather, such as the last week here, during which they were obliged to remain out of the tunnel for one day, in consequence of the accumulation below, although there is an air shaft in communication with their work. From the above experiments it was considered that in such ground as this tunnel goes through, the same work might be done by using one-fifth part of the weight of gunpowder—that is, that one ton of gun cotton would perform the work of five tons of powder. Now, powder costs £44 per ton, and gun cotton 3s. a pound or £336 per ton, leaving a difference in favor of powder of £116 in every five tons of powder; and it is a matter to be decided only by further experiments, whether the absence of smoke and the diminished amount of noise and vibration are worth purchasing at this increase of price. It is evident, however, that the only true means of testing the relative efficiency of the two would be to get out one complete length, through the same stuff, with each, and compare the amount of power and of cotton required. The comparative expense of the two would then be known most accurately.

#### Institution of Mechanical Engineers at Birmingham.

This "Institution" appears to direct its attention particularly to mechanical improvements. At their meeting on the 28th of April, "in the absence of George Stephenson, Esq., President, Mr. McConnell was called to the chair, and the minutes of the last meeting having been read by the Secretary, (Mr. Archibald Slate,)

The Chairman rose and said, the present meeting was one of the four ordinary meetings provided by the rules of the Institution, and required to be held on the fourth Wednesday in April. Since the last meeting, the Council had met on several occasions, and after discussing various subjects of interest to the Institution, they invited the London and Manchester branches of the body to meet them, consider their proceedings, and confirm them if approved of. The gentlemen from Manchester accordingly attended a meeting of the Council, on the 21st of April, confirmed the past minutes of Council, and suggested some further improvements in the management of the Institution. The business of the present meeting was to confirm the minutes of the last general meeting, to receive new members and communications, and consult as to future operations; and here, perhaps, before they proceeded further, he might be allowed to say he had a very agreeable piece of intelligence to communicate, which he was sure would be very gratefully received by the meeting. It was the announcement of a handsome donation of 100*l.* to the Institution, by their worthy and highly esteemed President, to whom he begged leave to propose a vote of thanks for this additional mark of his estimation of the Institution, which was unanimously assented to.

The Chairman stated that the Council was of opinion that the members ought at once to proceed to work and supply information on useful subjects; and, in order to make a commencement, they had forwarded the following suggestions to each member of the institution:—

- "1. The best form of railway axles and wheels.
- "2. The best description of engine and mill for manufacturing iron.
- "3. The best form of barker mill or turbine.
- "4. The best form of luggage engine for narrow gauge.
- "5. The most economical stationary steam engine, with coal at 6s., 12s., and 24s. per ton, taken in a commercial point of view.
- "6. The best form of air-pump valves.
- "7. The best high pressure marine boiler.
- "8. The best description of pumping engine for the thick coal district of Staffordshire.
- "9. The flow of water through straight mains and curves."

The following papers were then read:—

1. "*Apparatus to be applied to railway carriages for lessening the dangerous effects of collision on railways.*" By Mr. E. CHESHIRE.

This method has been described in the Journal for September last, p. 285, it simply consists in applying beneath all the length of the body of each passenger and other carriage of every train an inflexible unyielding rod, which is termed a "safety-buffer," of wrought iron, and a tube plugged with wood, supported in suitable bearing-sockets beneath the framework of the carriage, at the middle of the breadth thereof, and left loose in those sockets. The safety-buffer terminates at each end with an enlarged head like those of ordinary buffers, and the heads of the safety-buffer of each carriage correspond to the like heads of the safety-buffer of the preceding and following carriages. When the usual coupling links are screwed up to bring the ordinary buffer heads of the several carriages into elastic contact one with another, as is usual, there will be a vacant space between the safety-buffer head of each carriage and that of the next adjacent carriage, varying from three to six inches, more or less, according to circumstances, and the safety-buffers will not have any effect or operation in the ordinary course of travelling, but only in case of a collision. The safety-buffers in the van, at the hinder end of the train, and in the tender at the front end, are not to extend throughout the whole length of those carriages, and need not have any endway motion, but may be firmly fastened to the framework of those carriages, or they may be applied against strong elliptical springs, placed end to end for expending some of the force of the collision. The van is to be lower than the passenger and other carriages, in order that its centre of gravity may be nearer to the level of the rails. The van at the hinder end of the train is to have its ordinary buffers with easy yielding springs, which, with the same force applied to them, will allow those buffers to move through a much

greater space in respect to the van than the ordinary buffers of the carriages of the train, so that, in case of a collision from behind, the ordinary buffers of the van being so yielding, they will not act with much force against the corresponding buffers of the hindmost carriage of the train.

*Remarks.*—Mr. W. ROBINSON, of London, said, it might be advanced against the proposed improvement, that every rod being six inches less in length than the side buffer, would lose six inches in every carriage; consequently, supposing a train to be composed of, say 50 carriages, it would require 25 feet for the stroke of the last buffer. It might also be objected that the rod would double up; four or six inches in diameter was not sufficient to take the amount of force imparted by the collision. He would estimate that it would require 13 feet diameter to oppose the force of the shock imparted to it.

Mr. CHESHIRE replied, that the momentum was communicated to the first rod, and through each individual rod to the last instantaneously, and through it to the hinder van, just as in the case of a number of billiard balls placed in a row. When the first was struck, the last was driven away with all the impetus communicated to the first, leaving the intermediate balls perfectly at rest.

A member suggested that it would require 300 tons to double up a rod four inches in diameter.

Mr. CHESHIRE—I take it at that calculation, and say, consequently, supposing the momentum of the collision to be greater than that, it was quite evident that 300 tons must be taken from the amount of collision imparted to the train and expended upon the van behind the train. As the stroke of the side buffer was 13 inches, it was quite clear six inches might be allowed for the stroke of the centre buffer without any injury to the passenger carriage; consequently, if 25 feet were lost in the centre buffer in a train of 50 carriages, 54 feet would be gained by the stroke of the side buffer, having a surplus of 29 feet.

2. "*Disconnecting Coupling.*"—Mr. JOHNSON, locomotive superintendent of the Manchester and Leeds Railway, produced a model of an invention for disconnecting the carriages from the engine, in the event of an obstruction on the line, or any other accident which would cause the engine to run off the rails, by a self-acting disconnecting coupling chain, which he proposed to apply between the tender and the luggage van. It was exceedingly simple and inexpensive, and might be applied to any train with a slight alteration of the present coupling crook of the luggage van or carriages. In case the engine or tender got off the rails from any cause whatever, regardless of the speed, the engine or tender would be immediately disengaged from the train, allowing the latter to remain on the line perfectly uninjured, and thereby accomplishing the object for which it was intended. He had had a working model 12 months, and during that time tried it repeatedly, and could now speak confidently of its merits.

Mr. MIDDLETON, having inspected the model, said he believed a patent had been taken out some years ago for a similar invention. He thought the plan a very good one; but he was under the impression that at the time Dr. Church's carriage was before the public, it was said that such an invention had been patented.

Mr. BEYER was also of opinion that the idea or principle of the invention was not new, as it had been proposed by Mr. Watson Buck, engineer, on the opening of the Manchester and Birmingham Railway.

Mr. RAMSBOTTOM, of the London and North-Western Railway, feared the violent oscillation of the carriages would produce the same result. He had seen carriages vibrate very much when not sufficiently tight.

3. "Railway Axles."—Mr. H. BESSEMER, manufacturer, London, produced a model of a railway axle, to do away with the necessity of covering the tire, which the inventor stated caused great wear and tear of the rails and tires, and also a tendency in the carriages to an oscillating or vibratory motion when running on a straight line. Mr. B. stated that the means by which he proposed to effect his object was by cutting the axle in two in the centre, and holding it rigid and in its place by a long coupling, with concentrated grooves, so that each wheel, and the end of the axle, could revolve independently of the other.

Mr. BEYER said an invention for accomplishing the same object had been proposed, and applied before, and in his opinion one more simple had been tried. He had seen the same idea carried out in two different ways. He questioned the desirableness of having such an invention at all.

4. "Description of a new Railway Break," by Mr. F. KNIGHT, was read, which requires a drawing to make it understood.

To be continued.

From the first number of the Mining Journal and American Railroad Gazette.

#### Lake Superior Mineral Region, Bruce Mines.

These mines, so called in honor of his excellency, Lord Elgin, are situated on the north shore of Lake Huron, opposite the island of St. Joseph, and about seventy miles below the Sault de St. Marie, within thirty hours' run by steam, from Detroit. The mine was discovered and is in charge of Capt Keating, late of the Indian Department of Her Majesty's service. Recent accounts state the quantity of ore raised at this mine, is now 200 tons, with the labor of six men. Copper ore containing 20 per cent. of copper, is valued at \$3 per ton, for each 1 per cent.: or for 20 per cent. ore, \$60 per ton. If so, the six men employed at the Bruce mines the last winter, have raised \$12,000 worth of ore.—Not a bad job.

We give below extracts from two letters, written by Capt. Keating to Mr Rankin, and published in the Detroit Advertiser.

Extract of a letter dated "Bruce Mines," }  
February 18th, 1847. }

"We commenced by uncovering about 40 feet of the vein, and getting out the surface ore which is of the richest description, and soon became satisfied that what might have

been merely a lode of ore, was a good and well defined vein, rather exceeding two feet six inches in average width. After some time spent in thus carrying down stakes, as they are technically called, to the depth of about three feet, we commenced sinking our shaft at the eastern extremity, where the rather hard rock appeared softer and more favorable. The varieties of ore are yellow copper, horse flesh, iciclesint, purple blue, and we have found of late, a considerable quantity of gray sulphuret, largely intermixed with the others. The shaft is sunk to the depth of two fathoms and a half, and, so far, has been carried down twelve feet by nine. Our pile consists of upwards of sixty tons of rich ore, the greater part of which Harris (the head miner) says, will only require breaking and will not (so good is it) require to be at all washed. Thus, you will see that, without some extraordinary occurrence, we shall exceed, by a considerable quantity, 100 tons ere we meet again. Nor is this all. Harris has discovered a vein, not far distant from that now working, of precisely the same quality, and about the same width. Upwards of a ton of copper ore, which was taken out, to test it in two blasts, leaves no doubt upon the subject. I have also been fortunate. One rainy day, having seen a partridge on going to my hare traps, I returned by a short cut through the woods, and came on a rather high ridge of rock, not more than 300 yards from the shore, and stumbled upon a magnificent vein, of fully eight feet in width. It appears, evidently, to be the continuation of that showing itself at the little point which you may remember, and where you shipped most of the ore you procured. I immediately took Harris to see it, and he was quite surprised at its extent, and proposed putting a few blasts in it to ascertain its quality.—This was done accordingly, and the result was similar to that in the former case—for, in two blasts, more than a ton was got out, of a very fine quality, and containing black copper, the yield of which is beyond that of any other ore, by the miners' account."

Extract of a letter dated "Bruce Mines," }  
16th March, 1847. }

"The courier arrived yesterday, and I received to-day your welcome letter of the 26th January last. I hasten to reply to it. Our prospects are cheering indeed. As my last letter will have apprised you of what has been done, and as every thing has been going on even more favorably than when I wrote last, our share of the matter will have been well done. We have now full 100 tons of ore of the best quality, much of it far superior to what you took down, the proportions of horse flesh being greater. We have also discovered and blasted into a vein eighteen feet wide of a similar quality, and on the same location. Our shaft is four fathoms deep, and the vein better and wider than on the top. You will, I think, be (and so are all who hear of it,) much surprised at our progress with five men, and one being always cooking, and our pile looks splendid. I would not give this location, which I think teems with veins, for any two on lake Supe-

rior. I expect to have at least 150 tons when you arrive. Each day gives continued and increasing success. To-day some beautiful specimens were brought in—crystals of spar and copper thickly intermixed, and also sulphate of barytes."

#### Annual Reports of the New York Railroads. REPORT OF THE UTICA AND SCHENECTADY RAILROAD COMPANY FOR 1846.

HON. N. S. BENTON, Secretary of State.

SIR: The Utica and Schenectady Railroad Company, in compliance with a resolution of the honorable the Assembly of the State of New York, passed on the 2d day of February, 1843, submit the following report for the year 1846, containing a statement of the various matters required by the said resolution, viz:

Length of road in operation, 78 miles.	
Cost of construction.....	\$2,189,506 10
Income from passengers as follows:	
15,390 $\frac{1}{2}$ through passengers, at \$3.....	46,171 50
108,489 $\frac{1}{2}$ " " " " 2.....	216,979 00
2,018 $\frac{1}{2}$ " " " " 1.....	2,523 12
8,765 " " " " 1.....	10,342 70
134,663 through passengers.....	276,016 32
87,155 way ".....	71,519 19
Total income from passengers.....	347,535 51
Income from freight.....	65,296 57
" U. S. mail.....	5,850 00
" other sources.....	9,713 90
Total income for 1846.....	\$428,395 98
Expenses for repairing and running road.....	167,820 82
Do, engines, cars and grading.....	75,609 70
Amount of dividends.....	160,000 00
Total expenses and dividends.....	\$403,430 52
Number of locomotive engines.....	15
An undivided interest in 42 eight wheel passage cars, 10 eight wheel emigrant, 14 eight wheel baggage and 4 eight wheel mail and baggage cars, owned by the railroads between Albany and Rochester, in all.....	70
Eight wheel freight cars.....	39
Four " ".....	61
Number of machine shops.....	1
Number of horses.....	3
Average number of men employed.....	200
Number of miles run by passenger trains.....	167,600
Number of miles run by other trains making repairs and carrying materials, etc. ....	70,488
Total number of miles run.....	238,088

STATE OF NEW YORK,  
City and County of Schenectady, } ss.  
William C. Young of the city of Schenectady, being duly sworn, saith that he is the superintendent and engineer of the Utica and Schenectady railroad and that the foregoing statement, taken from the books of said company, is correct and true in all respects, as he verily believes.

Wm. C. Young,  
Eng. & Supt. U. & S. R. R.  
Sworn to before me, this 29th day of January, A.D., 1847.  
HENRY Q. LANSING,  
Commissioner of Deeds.

REPORT OF THE SYRACUSE AND UTICA ROAD.  
To the honorable the Secretary of State of the State of New York.

The Syracuse and Utica railroad has been open for transportation for passengers for the last eight years. The company having determined to relay the road with an iron rail of the most improved form, have contracted for a considerable portion of the iron necessary, and are proceeding with the intention of laying a substantial structure adequate to the proper performance of the business required. The present wood structure has cost

the company ..... \$417,075 55  
The iron now laid thereon is the flat bar and will be useless, and therefore will be sold. It is hoped that there may be derived from the sale of it ..... 80,000 00

Leaving the sum of ..... \$337,075 55

Which has been expended for the cost of the wood structure, which in addition to a large annual amount for repairs, will be practically worn out, sunk and gone when the new structure is laid and used. The new structure, it is supposed, will cost about the same as the former, towards which, it is hoped, the old iron will pay as above, \$80,000, leaving the sum of about 300,000 to be raised by the company on its credit.

This will, when paid, reimburse the capital of the company for the equivalent amount which has been appropriated to the worn out structure. In addition to the cost of the new structure, there will be required a considerable sum for new engines, cars, etc. The demand upon the company for the transportation of property at the close of the canal, has entirely exceeded its capacity to do this business. Property destined for sale in the eastern markets in large quantities, was stopped at most points upon the line of railroad contiguous to the canal. Being practically confined to the winter months in this branch of business, it cannot be expected that the company could provide a supply of cars for this sudden and extraordinary demand when they must stand idle and go to waste during two-thirds of the year.

When the road shall be relaid with the proposed iron rail, the public will require that the trains shall be run with increased speed. In relation to this subject, it is deemed proper to refer to the following suggestions contained in the report of this company made last year:

"Very great embarrassment is experienced from the fact, that cattle are allowed to run at large, and to impede and so often delay the trains as at present. It is a serious matter, and unless more care shall be bestowed by the owners in restraining them, either at their own suggestion, or in pursuance of some proper law to be passed, it will be found very difficult to make good time upon this line. A part of our business must always be done in the night, and it is then that we experience the great hazard. The trains are frequently thrown off by them, and the danger to the persons in charge and to the passengers is often imminent. The owners always insist upon pay for their animals destroyed, without reflecting upon the great damage that they cause to the property of the company, and the more fearful injury that might ensue to passengers. If the owners will not take care of them it is impossible to keep them off. In Massachusetts much less difficulty in this respect is experienced, for there, it is believed, a penalty is incurred by the owner of domestic animals that go upon the railroad. Our business is conducted with all possible care in this respect, and the engine men suitably feel the risk of life or limb (which to them is almost as important) that they incur from the growing evil.

"A very proper law in this State has guarded the public and the company against direct wanton injury to the trains by individuals. It is submitted that negligence in allowing animals to run upon the railroads should be prevented by some suitable restraints."

The following table shows the whole receipts of the company from all sources, and the expenses and disbursements actually paid each year.

STATEMENT Of the receipts and expenditures of the Syracuse and Utica Railroad Company, for the years 1839 to 1846, inclusive.										
Years.	EXPENSES.				RECEIPTS.				Net gain over all expenses.	
	Transportation.	Construction.	Total.	Passengers.	Freight.	Mail.	Miscellaneous.	Total.		
1839....	\$34,438 02	\$25,303 45	\$59,831 47	\$122,185 29	.....	.....	.....	\$132,185 29	\$62,353 32

1846....	159,078 33	12,112 73	171,191 06	222,708 56	19,623 50	6,289 75	2,015 41	257,637 29	86,446 16	
	\$674,625 28	\$207,683 56	\$882,308 84	\$1,387,943 21	\$43,745 37	\$57,744 10	\$17,019 05	\$1,506,451 73	\$634,142 89	

The following is the tabular statement:  
Tabular statement relative to the Syracuse and Utica Railroad Company, made to the Secretary of State, agreeable to a resolution of the Assembly, passed February 2d, 1843, showing the business of the road for 1846.

Length of the road 53 miles.  
Cost of construction ..... \$1,128,940 24  
Less amount charged to account "depreciation property," for reduced value of engines, cars, 30,000 00  
\$1,098,940 24

Received from 103,798 $\frac{1}{2}$  through passengers ..... 207,597 00  
Received from 51,481 way passengers ..... 22,111 56  
Received from transportation of freight, ..... 19,623 50  
Received from transportation of U. S. mail ..... 6,289 75  
Received from miscellaneous sources ..... 2,015 41  
Expenses for repairing, operating, and running the road, including the amount paid for debt and new cars ..... \$124,932 48  
Amount paid for new track 38,241 12  
do permanent fixtures ..... 8,017 56

\$171,191 16  
Expended on account of construction for land ..... 12,112 73  
Dividend paid February 15 ..... 40,000 00  
do August 15 ..... 40,000 00

Number of locomotives, 9.

An individual interest in 42 eight wheeled passage cars, 10 eight wheeled emigrant, 14 eight wheeled baggage, 4 eight wheeled baggage and mail, owned by the railroads between Albany and Rochester.

Number of freight cars, 40; number of passage cars, 9; machine shop, 1. Average number of men employed by the company, 120.

Number of miles run by passage trains ..... 95,000  
do do freight and other trains ..... 35,000

130,000

#### REPORT OF THE AUBURN AND SYRACUSE RAILROAD COMPANY.

Hon. N. S. BENTON, Secretary of State.

Sir—Herewith is transmitted the statement of the Auburn and Syracuse Railroad Company, pursuant to a resolution of the Assembly, passed February 2, 1843, for the year ending December 31, 1847.

1. Length of road, 26 miles.
2. Cost of construction as stated to January 1, 1846 ..... \$675,239 02
3. Expended on construction in 1846 ..... 3,947 50

Balance of interest account to Jan. 1, 1846 ..... \$93,034 23

Expended for interest in 1846 12,003 15

105,037 38

Total to January 1, 1847 ..... \$781,222 90

4. Income from passengers ..... \$98,051 71
5. do freight ..... 16,886 32
6. do U. S. Mail ..... 4,050 00
- do incidental ..... 50 00

119,038 03

7. Number of through passengers ..... 96,675 $\frac{1}{2}$

8. Number of way passengers ..... 9,134

105,809 $\frac{1}{2}$

9. Receipts from passengers ..... \$98,051 71

10. Expenses for repairing and running road ..... 46,164 08

11. Amount of dividends ..... 32,000 00

12. Number of locomotive engines ..... 4

13. Number of passenger, mail and baggage cars as follows:  $\frac{2}{3}$  parts of all the passenger, baggage and mail cars owned as common stock between Albany and Rochester, being 52 eight wheeled passenger cars and eighteen eight wheeled baggage cars.

14. Number of freight cars (4 eight wheeled, 18 four wheeled) ..... 22

15. Number of machine shops..... 1  
 16. Average number of men employed.... 56  
 17. Number of miles run by passenger, freight, and other trains..... 61,660

Cayuga County, ss.

Thomas Y. How, Jr., Director and Treasurer, and Elijah P. Williams, Superintendent of the Auburn and Syracuse Railroad Company being duly sworn, doth depose and say, that the above statement is correct and true according to the best of their knowledge and belief.

THOMAS Y. HOW, JR.  
 ELIJAH P. WILLIAMS.

Sworn this 1st day of February, 1847, before me,

# REPORT OF THE AUBURN AND ROCHESTER RAILROAD COMPANY.

Hon. N. S. BENTON, *Secretary of State.*

Sir—The president, directors and company of the Auburn and Rochester Railroad submit the following report of the business of the road for the year 1846, in conformity to a resolution of the Assembly of the State of New York, passed February 2d, 1843.

The length of the road is 78 miles.  
 The cost of construction to 1st of Jan., 1846, was.....\$1,832,045 18  
 Expended on construction in 1846..... 32,999 28

Total cost of construction to 1st Jan., 1847, is.....\$1,865,044 46

Received from through passengers... \$169,006 98  
 do way do ... 84,066 23  
 do freight..... 20,201 76  
 do U. S. mail and other sources..... 16,895 58

Total income for the year 1846..... \$290,170 55

Expended for repairs and running road \$110,353 24

Dividend paid 1st February, 1846... \$56,000 00  
 do 1st August, 1846..... 56,000 00

\$112,000 00

Number of through passengers..... 62,218  
 do way do ..... 80,037

Total number of passengers..... 142,255

Number of miles run by passenger trains..... 135,563

Number of miles run by freight trains do do all other do 24,590

Total number of miles run..... 189,245

Number of locomotives..... 10

Number of eight wheel freight cars..... 16

Number of four wheel do ..... 12

Number of passenger, baggage and mail cars, viz: 1st of the following, owned in company with the line of railroads between Rochester and Albany, viz:

Eight wheel passenger cars..... 42  
 do emigrant cars..... 10  
 do baggage cars..... 14  
 do baggage and mail cars..... 4

Total in passenger business..... 70

Number of horses..... 4

Number of machine shops..... 2

Average number of men in the employ of the company:

Carpenters..... 21  
 Blacksmiths..... 10  
 Machinists..... 23  
 Laborers..... 106  
 All others..... 30

Total number..... 190

All which is respectfully submitted,  
 CHAS. SEYMOUR,  
*Sec'y and Treas. A. & R. R. Co.*

Ontario county, ss.

I, Charles Seymour, secretary and treasurer of the Auburn and Rochester Railroad Company, being duly sworn, depose and say, that the foregoing state-

ment is true according to the best of my knowledge and belief.

CHAS. SEYMOUR,

*Sec'y and Treas. A. & R. R. Co.*

Subscribed and sworn before me, this 13th day of January, 1847.

S. C. WHITE, *Justice of the Peace*

# REPORT OF THE TONAWANDA RAILROAD COMPANY.

In compliance with the resolution of the Honorable the Assembly, passed February 2, 1843, the Tonawanda Railroad Company would report:

1. The length of the railroad of this company in operation is estimated at 43½ miles.  
 2. The cost of construction of the railroad of this company is as follows:  
 Amount charged to construction up to January 1, 1846, as per last report.....\$751,053 28  
 Expended for construction in 1846..... 2,501 91

Whole cost of construction..... \$753,555 19

3. The income for the year 1846 from passengers, from freights, and from all other sources, was as follows:

From passengers.....\$111,583 09  
 do freights..... 23,779 97  
 do U. S. mail..... 6,347 25  
 do storage..... 2,107 89

\$143,818 20

Sinking fund with revenue from N. Y. Life Insurance and Trust Co.....\$5,333 33

From sale of iron rails and iron..... 3,161 65  
 do car sold..... 300 00  
 do interest received..... 447 91

Total.....\$153,061 09

4. Number of through and way passengers in '46.

Number of through passengers..... 65,359½ paying \$93,604 06  
 Number of way passengers..... 27,028 do 17,316 94

4th of July and state fair do 762 07

Total.....92,387½ \$111,583 09

5. Expenses for construction and for repairs, and for running the road, etc.

Paid for construction in 1846..... \$2,501 91

do repairs and running the road..... 45,184 49

Paid in purchasing debts of the company with interest thereon..... 33,566 19

Paid interest on mortgages and other debts..... 1,234 03

Paid interest and sinking fund on loan of State credit..... 7,047 82

F. WHITTLESEY, *Secretary.*

Rochester, January 16, 1847.

State of New York, Monroe county, ss.

Frederick Whittlesey and Lewis Brooks, of the city of Rochester, being duly sworn, severally depose and say, first: The said Frederick Whittlesey saith that he is secretary of and director in the Tonawanda Railroad company. Second: The said Lewis Brooks saith that he is treasurer of and director in said company; and they each for themselves say, that from the examination of the books of said company, and from their knowledge of the affairs of the said company, and from the accounts kept in the different offices of the said company,

they have compiled the above report, and believe that the same is correct and true.

FREDERICK WHITTLESEY.

LEWIS BROOKS.

Sworn and subscribed, this 16th day of January, 1847, before me.

B. SCHAEFFEL,  
*Commissioner of Deeds.*

# ATTICA AND BUFFALO RAILROAD CO.

In compliance with a resolution of the Assembly passed February 2, 1843, the Attica and Buffalo railroad company submit the following report for the year 1846:

Length of the Attica and Buffalo railroad, 36 miles and 26 chains.

Length of branches about 50 chains.

The company own and have in use,

4 long passenger cars.

2 short do.

5 long freight cars.

1 mail and baggage car.

6 short freight and baggage cars.

24 short wood cars.

4 locomotive engines.

1 machine shop.

The average number of men, 26.

The cost of construction of the road is as follows:

Amount charged to construction to January 1, 1846, [correcting] the last report.....\$303,257 89

Amount charged in 1846 to same acc't. 3,446 63

Total cost of construction..... 30,704 52

Paid for cars and engines up to January 1, 1846..... 38,392 53

Paid for cars and engines in 1846..... 9,711 80

Total cost of engines and cars..... 48,104 33

The income of the road for the year 1846 from all sources, was as follows:

Income from passengers.....\$72,405 55

" freight..... 8,185 64

" U. S. Mail..... 4,800 00

J. O. PUTNAM,

*Sec. and Treas. A. and B. R. Co.*

Buffalo, January 25, 1847.

Erie County, ss.

James O. Putnam, of the city of Buffalo, being duly sworn, deposes and says, that he is the secretary and treasurer of the Attica and Buffalo railroad company, that he has prepared the foregoing statement from the books of said company, and that it is correct according to the best of his knowledge and belief.

J. O. PUTNAM.

Sworn before me this 1st day of February, 1847.

T. BURWELL,

*Judge of Erie County.*

BUFFALO AND NIAGARA FALLS RAILROAD COMPANY.

To the Hon. the SECRETARY of the State of New York.

The Buffalo and Niagara Falls Railroad Company would respectfully submit the following report for the year 1846:

Length of road, 22 miles.

Cost of construction to January 1, 1847. \$905,902 95

Passenger earnings..... 29,840 92

Extra baggage, furniture, etc..... 3,314 82

Mail earnings..... 800 00

Amount paid for dividends..... 13,915 33

Current expenses..... 14,644 39

Number of through passengers.....	42,899
do way passengers.....	7,916
do locomotives.....	3
do passenger cars of eight wheels	2
do do four ".....	10
do baggage and lumber cars....	6
Average number of men employed.....	18
Number of miles run by locomotive.....	24,500

Very respectfully, yours,

W. A. BIRD, Treasurer.

Buffalo, Jan. 24, 1847.

#### IMPORTANT EXPERIMENTAL TRIP.

On Thursday, May 13th, there was a grand day with the steam navy at Woolwich, the Lords Commissioners of the Admiralty having ordered an experimental trip with all the steam-vessels at that station which were in a state of sufficient forwardness for the purpose. The vessels originally appointed to compose the squadron were, the Amphion, 36 guns (300 horse power;) Sharpshooter (iron screw st.;) Rifleman (wooden screw st.;) Minx (iron screw st.;) Teazer (wooden screw st.;) Growler (st. sloop;) Kite (st. v.;) and Princess Alice (iron st. packet.) Owing to the arrangements being incomplete, the Sharpshooter and Rifleman did not join the squadron. Between nine and ten o'clock the Lords Commissioners arrived. At ten minutes past eleven the signal was given from the Black Eagle to loose from moorings, and in about ten minutes the fleet started from Woolwich in the following order: Teazer (screw) leading the way, followed by the Amphion, Monkey, Black Eagle, and Kite, and in this order they proceeded down Woolwich Reach, and up the galleons. The Amphion was, of course, the principal object of interest, and upon testing her speed, it was found that with the engines making 45 revolutions, and with her jib set, her rate of speed through the water was 6.8 knots. The Teazer proved to be the slowest boat of the fleet. In Half-way Reach the Black Eagle put on her full speed, and soon came up to the Amphion, and then reducing her engines to half speed, she kept within hail of the Amphion during the remainder of the cruise. Their lordships, who took their station on the paddle-box of the Black Eagle, with Sir J. J. Gordon Bremer, paid especial attention to the Amphion, and signalled to hoist the spanker sail, the wind then blowing stiff from the south-east. The log was again thrown overboard, and the speed with the engines at forty-seven revolutions proved to be 7.8 knots. When the squadron reached Erith, the Minx, which is a faster boat than either the Amphion or Teazer, soon headed the fleet, the Amphion holding on her way, with the Kite on her larboard, and the Black Eagle on her starboard, quarter; the Teazer a considerable distance astern, and the Growler (which had been detained at Woolwich) just bearing in sight. The squadron passed Erith at a quarter past twelve, and a signal was then hoisted from the Admiralty yacht (Black Eagle) to put on more sail; an order which could not then be complied with, as the wind was unfavorable. In Long Reach, the speed of the Amphion was tried at the measured mile, which was done in 8 min. 52 secs., the tide having just ebbed; this gives a rate of speed equal to 6.766 knots, or about 8 miles,

with the engines making 44½ revolutions. As the squadron neared Greenhithe, their lordships boarded the Amphion, and ordered all sail to be set. The spanker, jibs, and topsails were then set, and this vessel, under the conjoint influences of wind and steam, careered rapidly on her way. The Growler, which had continued her course at full speed, here overhauled the fleet, and passing the Amphion to port, took up her station as the leading steamer on the starboard side. The squadron stood on through Sea Reach, where the full operations of both wind and tide was felt; and here the log gave a speed of 10 knots. Having reached the estuary of the Thames, their lordships signified their wish to return, and the Amphion was brought round with great celerity, and they embarked at once on board the Black Eagle. It may be as well to state that this is the first time the experimental trials with the Amphion have proved successful. In all former trials the success was most incomplete, the engines would scarcely work for half an hour without stopping, owing to the canvass collapsing. Metal valves have now, on the recommendation of the authorities at Woolwich been adopted, and the result has proved in the highest degree satisfactory. A correspondent says—"considering the great size of the Amphion, and that her auxiliary engines are only of 300 horse power, a very small proportion for a frigate of 36 guns, her progress through the water was surprising, and leads to the belief that she will prove one of the most serviceable vessels afloat." She carried with her in this cruise, all her guns, with stores, provisions, and water, for three months, and a large supply of coals.

#### First Manufacture of Railroad Iron in the United States.

We cheerfully give place to the following communication, says the editor of the Merchant's Magazine, from an intelligent correspondent residing at Lynchburg, Va., and a large stockholder in the "Tredegor Iron Company," of the State. Our correspondent, it will be seen, refers to an extract from the "Miners' Journal," published in the MERCHANTS' MAGAZINE for January, 1846, in which it is stated that the first railroad iron was made in 1844; and to a correspondent in a subsequent number of our Journal, who states that the "Great Western Iron Company," on the Allegheny river, produced in 1842, two hundred tons of railroad iron.

To the Editor of the Merchant's Magazine and Commercial Review:—Sir—In the January number of your truly valuable work, I find an article on the manufacture of railroad iron, taken from the Miners' Journal, in which it is stated that only two years have elapsed since the first ton of railroad iron was made in this country; and again in your February number, this subject is noticed, and the belief expressed that the credit is due to the "Great Western Iron Company," of Pennsylvania, for introducing this important branch of the iron business into our country. Both of these statements are erroneous, doubtless unintentionally so. I have no doubt that the first railroad iron made in the United States was manufactured by the Tredegor Iron Works, at Richmond, Va. The evi-

dence I will offer to sustain the claims of Richmond, is, I think, pretty conclusive. I give it in an extract from a letter of John F. Tanner, Esq., secretary of the Tredegor Iron Company, dated Richmond, 1st February, 1846, to whom I made application for accurate information, after reading your January number, lest my memory should mislead me. Mr. Tanner says, "the first railroad iron made at these works was manufactured in (1837) eighteen hundred and thirty-seven. In 1838, we made a considerable quantity for the Richmond, Fredericksburg, and Potomac Railroad Company, and other roads in this State." Ever since that period, occasional orders for railroad iron have been executed at these works. The Tredegor works were erected in 1836-7; commenced operations, I think, the 8th of May, 1837. They were built by Edward Cunningham, John A. Cunningham, and Francis B. Deane, Jr., who conducted them on private account, till 1st of January, 1838; when a joint stock company was formed, under a charter obtained from the legislature, at the session of 1837-8; to which company Messrs. Deane & Cunningham sold their works. So it would seem that the individuals who projected and completed the Tredegor rolling-mill were the pioneers in the manufacture of railroad iron in the United States.

The capital stock of the Tredegor Iron Company is about \$280,000; the annual product turned out, about \$350,000; coal consumed, from 175,000 to 200,000 bushels; pig iron, about 4,000 tons; annual payments for labor, from 50,000 to 60,000 dollars. This establishment manufactures as great a variety of sizes of bar iron, rods, hoops, bands, extra sizes, rounds and squares, locomotive engines, screw moulds, boat plates, and rods for iron vessels, as any other in the Union. The quality of its production is equal to the best iron found in our markets, of English or American manufacture. Besides the extensive works for making malleable iron of almost every description, which the wants of commerce require, there is attached to them a very large foundry, with machine-shops, fitted up in the best manner, with lathes, etc., for building steam-engines, sugar-mills, machinery of every description. Also, a large boring-mill, and all necessary apparatus for finishing ordnance of the largest size ordinarily used, either in our army or navy. From the Tredegor iron foundry, castings of excellent quality and great variety are annually turned out. The ordnance made there is regarded equal to the best which the government procures elsewhere, of which fact the records of the war and navy departments will afford ample testimony.

I feel much confidence in claiming for the Tredegor works the credit of introducing several other important branches of iron manufacture, as well as railroad iron. I believe locomotive rolled axles were first made there; and if my information be correct, they have to a great extent superseded the English and American hammered axles. The same may be said of boat-rib irons; these were also first made at the Tredegor works, and I

am told that even now, there are descriptions of this important article used by government in building iron vessels, which can only be procured at these works.

Without intending any disparagement to other works, or the enterprise of my fellow-citizens in the Northern States, I am induced to make this communication,—first, that correct information may be placed before the public; and secondly, that it may be known that the unrivalled advantages possessed by Virginia, for the manufacture of iron, are not so entirely neglected as many believe them to be.

A STOCKHOLDER OF THE TREDEGOR CO.

**Rosin Paving.**—A portion of one of the streets in Fayetteville, N. C., is actually paved with solid rosin. A correspondent of the Boston Post says that he has rode a horse and driven a carriage over this novel pavement several times, and a capital road it makes. It has a beautiful clear look, presenting a smooth, hard surface, and it never rots. The manufacturer means to cast it into blocks of the right shape and size for constructing aqueducts, water-courses, and sewers.

**Advance of Tolls.**—The Reading Railroad Company have given notice that on the first day of July the rate of tolls on coal brought over their road will be advanced ten cents per ton above the present rate, and that an advance of ten cents per ton will be charged on each successive month.

**MICHIGAN CENTRAL RAILROAD.—NOTICE TO CONTRACTORS.**—Proposals will be received by the Subscriber until the 1st of August next, for the Grading of that portion of the Michigan Central Railroad lying between Antwerp and New Buffalo, a distance of 60 miles.

Profiles and specifications will be ready for examination after the 15th day of July next, at the office of the subscriber, or that of C. L. J. M. Berrien, at Kalamazoo, at which time the line will be shown to contractors.

J. W. BROOKS, Supt.  
Michigan Central Railroad Office,  
626 Detroit, June 17, 1847.

**NOTICE TO CONTRACTORS.—SEALED** Proposals will be received until Wednesday, July 15th, in the Borough of Harrisburg, and until Wednesday, July 22d, in the city of Pittsburg, at 10 o'clock A.M., at the Office of the Engineers, for the Grading and Masonry upon fifteen miles of the Pennsylvania Railroad, extending west from Harrisburg, and fifteen miles of said Railroad, extending east from Pittsburg. The grading will include very heavy work, and the amount of Masonry, including the Piers of Abutments of the Bridges across the Susquehanna, three-quarters of a mile in length, will be unusually large. Plans and specifications of the work can be seen at the Engineer's office in each place, for ten days previous to the time appointed for receiving the bids. Any further information can be had upon application to the Chief or Associate Engineers.

S. V. MERRICK, President.  
**BACK VOLUMES OF THE RAILROAD JOURNAL** for sale at the office, No. 105 Chestnut street.

**A. & G. RALSTON & CO., NO. 4** South Front St., Philadelphia, Pa.  
Have now on hand, for sale, Railroad Iron, viz:  
180 tons 2½ x 1 inch Flat Punched Rails, 20 ft. long.  
25 " 2½ x 1 " Flange Iron Rails.  
75 " 1 x 1 " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures.

**PATENT RAILROAD, SHIP AND BOAT** Spikes. The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal Iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

•• Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.  
ja45

**MANUFACTURE OF PATENT WIRE** Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by JOHN A. ROEBLING, Civil Engineer, Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition.  
2v19 1y

### FRENCH AND BAIRD'S PATENT SPARK ARRESTER.

**TO THOSE INTERESTED IN** Railroads, Railroad Directors and Managers are respectfully invited to examine an improved Spark-Arrester recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger & freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Supt Hartford and New Haven Railroad; W. R. M'Kee, Supt Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Supt New Jersey Railroad Trans. Co.; J. Elliott, Supt Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Supt Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Supt Macon Railroad, Macon, Ga.; J. H. Cleveland, Supt Southern Railroad, Monroe, Mich.; M. F. Chittenden, Supt M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckly & Drury, Boston, will be promptly executed.

FRENCH & BAIRD.  
N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

•• The letters in the figures refer to the article given in the Journal of June, 1844.

**PATENT HAMMERED RAILROAD, SHIP** and Boat Spikes. The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed.

JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y.

The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merriut, New York; J. H. Whitney, do.; E. J. Etting, Philadelphia; Wm. E. Coffin & Co. Boston.  
ja45

**MACHINE WORKS OF ROGERS,** Ketchum & Grosvenor, Patterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callen-lers; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR,  
445 Paterson, N. J., or 60 Wall street, N. York.

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trestles are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trestles, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trestles for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.	
4,924 Timbers, 11 ft. long, 3 x 6 inches =	68,696 ft. b.m., at \$10 = \$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	4,403 ft. b.m., at \$13 = 57 24
13,000 Spikes = 2,250 lbs. at 4½ cts. =	101 25
Workmanship free of patent charge. =	600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON,  
Civil Engineer and Patentee.  
No. 377 South Tenth St., Philadelphia. 33uf

## LAP-WELDED WROUGHT IRON TUBES

FOR

## TUBULAR BOILERS.

FROM 11-4 TO 6 INCHES DIAMETER,  
and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manufacture as those so extensively used in England, Scotland, France and Germany, for Locomotive, Marine and other Steam Engine Boilers.

THOMAS PROSSER,

Patentee.

1y25

28 Platt street, New York.

## RAILROAD IRON.

### MOUNT SAVAGE IRON WORKS

THIS Company are prepared to execute orders for RAILROAD IRON, of any pattern, and equal in point of quality to any other manufactured.

Address J. M. HOWE,

Pres't. Mt. Savage Iron Works,

Dec. 23, 1y\*

Maryland.

### ENGINEERS' AND SURVEYERS'

### INSTRUMENTS MADE BY

### EDMUND DRAPER,

Surviving partner of  
STANCLIFFE & DRAPER.

No 23 Pear street,  
1y10 near Third,

below Walnut,  
Philadelphia.

Road Depots, etc.

ANDREW MENEELY.

West Troy, May 12, 1847.

1y\*21

**PIG AND BLOOM IRON.**—THE SUBSCRIBERS are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by

A. WRIGHT & NEPHEW,

Vine St. Wharf, Philadelphia.

**RAILROAD IRON.**—THE "MONTGOMERY" Iron Company, Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to

MURDOCK, LEAVITT & CO.,  
Agents.

1y48

77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC** Cement. This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper-barrels, by JOHN W. LAWRENCE,

142 Front street, New York.

Orders for the above will be received and promptly attended to at this office.

32 1y

# RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolser of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

## ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—

for sale or imported to order by the subscriber. These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,

75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.		Weight per fathom.	Diameter of iron.	
	INCH.	LBS. OZ.	INCH.	LBS. OZ.		LBS.	INCH.	Tons.
11	4½	13 5	10	24 -		50	15-16	20
13	3½	9 3	8½	16 -		27	11-16	13½
14	3½	6 11	7½	12 8		17	9-16	10½
15	2½	5 2	6½	9 4		13½	1-2	7½
16	2½	4 3	6	8 8		10½	7-16	7

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1y24

## RAILROAD SCALES.—THE ATTENTION

of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLICOTT & ABBOTT.

Factory, 9th street, near Coates, cor. Melon st.

Office, No. 3 North 5th street, Philadelphia, Pa. 1y25

## THE SUBSCRIBERS, AGENTS FOR

the sale of  
Codorus,  
Glendon,  
Spring M.I. and  
Valley,  
Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

SAM'L KIMBER & CO.,

59 North Wharves,

Jan. 14, 1846. [1y4] Philadelphia, Pa.

## RAILWAY IRON.—THE BEST QUALITY

of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by

DAVIS, BROOKS & CO.,

Jan. 2. [11y] 68 Broad St., New York.

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 30 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,] WILLIAM ROE, Supt of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed,] G. A. NICOLL,

Supt. Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,] T. L. SMITH,

Jersey City, November 4, 1845.

N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot, Jamaica November 12, 1845.

[Signed,] JOHN LEACH,

1y19 Supt. Motive Power

## NICOLL'S PATENT SAFETY SWITCH

for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use; preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee  
G. A. NICOLLS,  
Reading, Pa.

## TO RAILROAD COMPANIES AND MANUFACTURERS

of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

THOMAS & EDMUND GEORGE,

245 N. E. cor. 13th and Market sts., Philad., Pa.

## RAILROAD IRON.—THE NEW JERSEY

Iron Company, Boonton, N. J., are now making Railroad Bars, and are prepared to execute orders for any required pattern. Apply to

FULLER & BROWN, Agents,

No. 139 Greenwich, corner of Cedar street.

June 1, 1847.

10f

## RAILWAY IRON.—DAVIS, BROOKS

& Co., No. 68 Broad Street, have now in port on Ship-board, 200 Tons of the best English heavy H Rails, 60 lbs. to the lineal yard, which they offer for sale on favorable terms, also, about 6 to 700 Tons now on the way, to arrive shortly, of the same description of Rail.

46f

## NORRIS' LOCOMOTIVE WORKS.

BUSH HILL, PHILADELPHIA, Pennsylvania.

MANUFACTURE their Patent 6 Wheel Combined and 8 Wheel Locomotives of the following descriptions, viz:

Class 1,	15 inches Diameter of Cylinder,	× 20 inches Stroke.
" 2,	14 " " "	× 24 " "
" 3,	14½ " " "	× 20 " "
" 4,	12½ " " "	× 20 " "
" 5,	11½ " " "	× 20 " "
" 6,	10½ " " "	× 18 " "

With Wheels of any dimensions, with their Patent Arrangement for Variable Expansion.

Castings of all kinds made to order: and they call attention to their Chilled Wheels, for the Trucks of Locomotives, Tenders and Cars.

NORRIS, BROTHERS.

**KEARNEY FIRE BRICK. F. W. BRINLEY**, Manufacturer, Perth Amboy, N. J. Guaranteed equal to any, either domestic or foreign. Any shape or size made to order. Terms, 4 mos. from delivery of brick on board. Refer to

James P. Allaire, } New York.  
Peter Cooper,  
Murdoch, Leavitt & Co.  
J. Triplett & Son, Richmond, Va.

New Jersey Malleable Iron Co., Newark N. J.  
Gardner, Harrison & Co. Newark, N. J.  
25,000 to 30,000 made weekly.

**THE NEWCASTLE MANUFACTURING** Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention. **ANDREW C. GRAY**, a45 President of the Newcastle Manuf. Co.

**RAILROAD IRON AND LOCOMOTIVE** Tyres imported to order and constantly on hand by **A. & G. RALSTON** Mar. 30th 4 South Front St., Philadelphia.

**VALUABLE PROPERTY ON THE MILL Dam For Sale.** A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 68,497 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, face screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x32 ft. with lathes, work benches, Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, turnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45 feet two stories high, with a shed part 45x20 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 200 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to **HENRY ANDREWS**, 48 State st., or to **CURTIS, LEAVENS & CO.**, 106 State st., Boston, or to **A. & G. RALSTON & Co.**, Philadelphia. ja45

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

PASCAL IRON WORKS.

## WELDED WROUGHT IRON TUBES

From 4 inches to 4 in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T. L. and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by **MORRIS, TASKER & MORRIS**, Warehouse S. E. Corner of Third & Walnut Streets, PHILADELPHIA.

**TO LOCOMOTIVE AND MARINE ENGINE Boiler Builders.** Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

**MORRIS TASKER & MORRIS**, Warehouse S. E. corner 3d and Walnut Sts., Philadelphia. 11f

**PATENT INDESTRUCTIBLE WATER** Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York.

J. BALL &amp; CO.

**SPRING STEEL FOR LOCOMOTIVES.**  
Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1½ to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
1y Albany Iron and Nail Works,

**THE SUBSCRIBER IS PREPARED TO**  
execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip.  
1y10 New York.

**LOCOMOTIVE AND CAR AXLES.**  
The Subscribers are now prepared to receive orders for the well known and approved Reading Locomotive and Car Axles—drawn to any required pattern from Bloom Iron only. Address

SAM'L KIMBER & CO.,  
41f Willow Street Wharf,  
Philadelphia, Pa.

**NOTICE TO CONTRACTORS.—ANDROS-  
COGIN AND KENNEBEC RAILROAD.**  
Proposals will be received at the Railroad Office, in Lewiston, until the 17th of June next, for the Grading and Masonry of the 1st Division of the Road, extending from the Atlantic and St. Lawrence Road in Danville, to Green centre, 14½ miles.

Also, separately, for the Masonry and Woodwork of the Bridges across the Great and Little Androscoggin Rivers, the Bridges to be constructed on Towne's plan.

Plans and Profiles will be ready for examination, and the route shown, on and after the 10th of June.

Satisfactory securities will be required of bidders unknown to the officers of the company.

The 2d Division, extending to Snow's Pond in Belgrade, 25 miles, will be ready for contract about the 25th of July; and the remainder of the road to Waterville, about the 20th of September.

HOBART CLARK, Agent A. & K. R. R.  
EDWARD APPLETON, Engineer.  
Railroad Office, Lewiston, May 8, 1847. 4121

**THE SUBSCRIBERS ARE PREPARED TO**  
execute orders at their Phoenix Works for Railroad Iron of any required pattern, equal in quality and finish to the best imported.

REEVES, BUCK & CO.,  
261f Philadelphia.  
ROBERT NICHOLS, Agent,  
No. 79 Water St., New York.

**CONCORD RAILROAD.—PASSENGER**  
Trains in connection with the Lowell & Nashua Railroads, run daily between  
Concord and Boston, Sundays  
excepted, as follows, viz:

Leave Concord at 5 40 and 11 5 a.m. and 3 15 p.m.  
Leave Boston at 7 and 11 a.m. and 5 p.m.

This road runs by Nashua and Manchester to Concord N. H., where it connects with the Northern railroad, extending from Concord to the mouth of White river in Vermont, 18 miles of which road, to Franklin, is now opened, and the remainder is rapidly completing.

It is the direct route to Central and northern New Hampshire, and to Montpelier, Burlington, and other towns in northern Vermont, and has a greater proportion of railroad conveyance in those directions than any other line.

It is also the British Steam Mail Line, and the nearest route from Boston to the Canadas. Numerous stages connect with all parts of the road.

For further information, apply at B. P. Cheney & Co.'s Express office, No. 8 Court St., and Averill & Dean, No. 15 Elm St.

All passengers' baggage should be properly marked, and when valued at more than \$50, notice must be given, and extra charges paid, or no loss beyond such amount will be allowed.

261f N. G. UPHAM, Supt.

**NEW YORK AND ERIE RAILROAD LINE**  
SUMMER ARRANGEMENT. For passen-  
gers, twice each way daily,  
(except Sunday,) leave New

York from the foot of Duane St. at 7 o'clock, A. M. and at 4 o'clock, P. M. by steamboat, for Piermont, thence by cars to Ramapo, Monroe, Chester, Goshen, Middletown, Otisville, and the intermediate stations.

The return trains for New York will leave Otisville at 6 30, A. M. and 4 15, P. M.; Middletown at 7 A. M. and 4 40, P. M.; Goshen at 7 22, A. M. and 5 3, P. M.; Chester at 7 35, A. M. and 5 18, P. M.

Fare between New York and Otisville, \$1 50; way-fare in proportion.

For Milk—Leave Otisville at 5½ o'clock, morning and evening.

For Freight—The barges "Samuel Marsh and "Henry Suydam, Jr." will leave New York (from the foot of Duane St.) at 5 o'clock, P. M. daily (except Sundays.)

No freight will be received in New York after 5 o'clock, P. M.

Freight for New York will be taken by the trains leaving Otisville at 10½ o'clock, A. M.; Middletown at 11½ A. M.; Goshen at 12½, P. M.; Chester at 1 o'clock, P. M., etc., etc.

For further particulars, apply to J. F. CLARKSON, Agent, corner of Duane and West Sts., New York, or to S. S. POST, Superintendent Transportation, Piermont.

241f H. C. SEYMOUR, Sup't.

**WESTERN RAILROAD.—ON AND AF-**  
ter Monday, April 5, 1847, the passenger  
trains will leave daily, Sun-  
days excepted, as follows:

Boston at 8 a. m. and 4 p. m. for Albany.  
Albany at 7 1-4 a. m. and 5 p. m. for Boston.

Springfield at 8 1-2 a. m. and 1 p. m. for Albany.  
Springfield at 8 1-2 a. m. and 1 1-2 and 3 p. m. (or on arrival of the train from New York) for Boston.

Day line to New York, via Springfield.—The steamboat train leaves Boston at 6 a. m., and arrives in New York at 7 p. m., by the steamboats Traveler, New York, or Champion. Returning, leaves New York at 6 1-4 a. m., and arrives in Boston at 7 p. m.

Night line to New York.—Leaves Boston at 4 p. m., and arrives in New York at 5 a. m.

Albany and Troy.—Leave Boston at 8 a. m., Springfield at 1 p. m., and arrive in Albany at 6 p. m.; or, leave Boston at 4 p. m., Springfield next morning at 8 1-2, and arrive in Albany at 1 1-2 p. m.

The Troy trains connect at Greenbush.  
The trains for Buffalo leave at 7½ a. m. and 7 p. m.

For Northampton, Greenfield, etc.—The trains of the Connecticut River Railroad leave Springfield at 8 1-4 a. m., 1 and 3 p. m., and passengers proceed directly on to Brattleboro', Windsor, Bellows Falls, Walpole, Hanover, Haverhill, etc.

For Hartford.—The trains leave Springfield on the arrival of the trains from Boston.

The trains of Pittsfield and North Adams Railroad leave Pittsfield on the arrival of the trains from Boston.

N. B.—No responsibility assumed for any baggage by the passenger trains, except for wearing apparel not exceeding the value of fifty dollars, unless by special agreement.

JAMES BARNES, Sup't and Eng'r.  
C. A. SEAD, Agent, 27 State street, Boston.

**BOSTON AND PROVIDENCE RAIL-**  
road. Passenger Notice. Summer Arrange-  
ment. On and after Mon-  
day, April 5, 1847, the Pas-  
senger Trains will run as follows:

Steamboat train via Stonington.—Leaves Boston every day, except Sunday, at 5 o'clock p.m.

Accommodation Trains—leave Boston at 7 and 10½ a.m. and 4 p.m., and Providence at 7½ and 10½ a.m. and 4½ p.m.

Dedham trains, leave Boston at 8 a.m., 12½, 3½, 6½ and 9 p.m., Leave Dedham at 7 and 9½ a.m. and 3½, 5½ and 8 p.m.

Stoughton trains, leave Boston at 11½ a.m. and 5½ p.m. Leave Stoughton at 7 10 a.m. and 3½ p.m.

All baggage at the risk of the owners thereof.

251f W. RAYMOND LEE, Sup't.

**NEW YORK & HARLEM RAILROAD**  
CO.—Summer Arrangement.—On and after  
Tuesday, June 1st, 1847, the cars  
will run as follows, until further  
notice. Up trains will leave the City Hall for—

Yorkville, Harlem and Morrisana at 6, 8 and 11 a.m., 2, 2 30, 5 and 7 p.m.

For Morrisiana, Fordham, Williams' Bridge, Tuckahoe, Hart's Corner and White Plains, 7 and 10 a.m., 4 and 5 30 p.m.

For White Plains, Pleasantville, Newcastle, Mechanicsville and Croton Falls, 7 a.m. and 4 p.m.—Freight train at 1 p.m.

Returning to New York, will leave—  
Morrisiana and Harlem, 7, 8 20 and 9 a.m., 1, 3, 4 30, 6, 6 20 and 8 p.m.

Fordham, 8 08 and 9 15 a.m., 1 20 and 6 15 p.m.

Williams Bridge, 8 and 9 08 a.m., 1 10, 6 08 p.m.

Tuckahoe, 7 33 and 8 25 a.m., 12 55 and 5 52 p.m.

White Plains, 7 10 and 8 35 a.m., 12 50, 5 35 p.m.

Pleasantville, 8 15 a.m. and 5 15 p.m.

Newcastle, 8 a.m. and 5 p.m.

Mechanicsville, 7 48 a.m. and 4 48 p.m.

Croton Falls, 7 30 a.m. and 4 30 p.m. Freight train at 10 a.m.

Freight train will leave 32d street for Croton Falls and intermediate places, 4 a.m. and City Hall 1 p.m.

Returning, leave Croton Falls 10 a.m. and 9½ p.m.

ON SUNDAYS, the trains will run as follows: Leave City Hall for Croton Falls, 7 a.m., 4 p.m.

Croton Falls for City Hall, 7 30 a.m., 4 30 p.m.

Leave City Hall for White Plains and intermediate places, 7 and 10 a.m. and 5 30 p.m.

White Plains for City Hall, 7 10 and 8 35 a.m., 12 30 and 5 35 p.m.

Extra trains will be run to Harlem, Fordham and Williams Bridge on Sunday, when the weather is fine.

The trains to and from Croton Falls will not stop on N. York island, except at Broome st. and 32d st.

A car will precede each train 10 minutes to take up passengers in the city.

Fare from New York to Croton Falls and Somers \$1, to Mechanicsville 87½c., to Newcastle 75c., to Pleasantville 62½c., to White Plains 50c. 251f

**LONG ISLAND RAILROAD COMPANY.**  
Summer Arrangement. On and after Monday  
May 1st, trains will run as  
follows, except Sundays:

Leave—Brooklyn at 9 1-2 a.m. for Farmingdale, 1 1-2 p.m. for Greenport, at 4 p.m. for Farmingdale.

Leave Farmingdale at 7 a.m. for Brooklyn, 12 m. do., at 3 1-4 do. do.

Leave Greenport at 8 1-2 a.m. for Brooklyn.

Leave Jamaica at 8 a.m. for Brooklyn, at 1 p.m. do., at 4½ p.m. do.

On Saturdays, a train will leave Brooklyn for Yaphank, at 4 p.m. Leave Yaphank, on Mondays for Brooklyn at 5 1-2 a.m.

On and after May 15th, and until September 1st, 1847, a train will leave Jamaica at 7 a.m. for Brooklyn—leave Brooklyn at 6 p.m. for Jamaica, and will land and receive passengers at any place between Brooklyn and Jamaica.

On Sundays—leave Brooklyn at 8 1-2 a.m. for Farmingdale; leave Farmingdale at 4 p.m. for Brooklyn.

Freight Trains—leave Brooklyn at 10 a.m. for Greenport; leave Greenport at 12 m. for Brooklyn.

Baggage crates will be in readiness at the foot of Whitehall street, to receive baggage for the several trains, 30 minutes before the hour of starting from the Brooklyn side.

The steamer "Statesman," Captain Nash, leaves Greenport for Sag Harbor on the arrival of the Accommodation train from Brooklyn.

251f DAVID S. IVES, Sup't.

**PATERSON RAILROAD**  
Summer Arrangement.  
Commencing April 20th, 1847, the cars will leave

Paterson at New York at  
8 o'clock a.m. 9½ o'clock a.m.

11½ o'clock a.m. 12 1-4 o'clock p.m.

4 o'clock p.m. 5½ o'clock p.m.

On Sunday,  
8 o'clock a.m. 9½ o'clock a.m.  
4 o'clock p.m. 5½ o'clock p.m.  
Office 75 Courtlandt St.

# **BALTIMORE AND SUSQUEHANNA** Railroad.—Reduction of Fare, Morning and Afternoon Trains between Balti-

more and York.—The Passenger  
trains run daily, except Sunday, as follows:  
Leaves Baltimore at.....9 a.m. and 3½ p.m.  
Arrives at.....9 a.m. and 6½ p.m.  
Leaves York at.....5 a.m. and 3 p.m.  
Arrives at.....12½ p.m. and 8 p.m.  
Leaves York for Columbia at.....1½ p.m. and 8 a.m.

Leave Haverhill at 6½ A.M. and 4½ P.M.

### **READING TRAINS.**

Leave Boston at 8½ A.M. and 8½ P.M.  
Leave Reading at 6 A.M. and 1½ P.M.

### **MEDFORD BRANCH TRAINS.**

Leave Boston at 7½, 1½ A.M., 2½, 5½, 7 P.M.  
Leave Medford at 6½, 8 A.M., 1½, 4½, 6 P.M.

The Depot in Boston is on Haymarket Square.

Passengers are not allowed to carry Baggage above \$50 in value, and that personal, unless notice is given, and an extra amount paid, at the rate of the price of a Ticket for every \$500 additional value.

1y31 CHAS. MINOT, Sup't.

## **NORWICH AND WORCESTER RAILROAD.** Summer Arrangement. Change of

Hours. Commencing on  
Wednesday, April 21, 1847.

Accommodation Trains, daily, (except Sunday.)  
Leave Norwich, at 6 a.m., and 4½ p.m. Leave  
Worcester, at 8½ a.m., and 4½ p.m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston, and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 2½ p.m. train from Boston.

New York Train via Steamboat.—Leave Norwich for Boston, every morning, except Monday, on the arrival of the steamboat from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 6½ p.m., daily, except Sunday, stopping at Danielsonville and Norwich.

Freight Trains daily each way, except Sunday.—Leave Norwich at 7, and Worcester at 6 30 a.m. Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are Less when paid for Tickets than when paid in the Cars. 321y  
J. W. STOWELL, Sup't

## **PHILADELPHIA AND READING RAILROAD.**—Passenger Train Arrangement for 1847.

A Passenger Train will leave  
Philadelphia and Pottsville daily, except Sundays, at 9 o'clock A. M.

The Train from Philadelphia arrives at Reading at 12 18 M.

The Train from Pottsville arrives at Reading at 10 43 A. M.

Fares.	Miles.	No. 1.	No. 2.
Between Phila. and Pottsville, 92	\$3.50 and \$3.00		
" " Reading, 58	2.25 and 1.90		
" " Pottsville " 34	1.40 and 1.20		

Five minutes allowed at Reading; and three at other way stations.

Passenger Depot in Philadelphia corner of Broad and Vine streets. 8tf

## **PHILADELPHIA, WILMINGTON & BALTIMORE RAILROAD.**—1847.

### **Summer Arrangement.**

Philadelphia for Baltimore...8 a.m. and 10 p.m.  
Baltimore for Philadelphia...9 a.m. and 8 p.m.  
Connecting with Mail Lines North, South & West.

On Sundays, only the 10 P. M. Lines run.

The Boat Lines, via Newcastle & Frenchtown R.R. Leave Philadelphia at 3½ p.m. No line on Sun. Leave Baltimore at 3 p.m. day.

Accommodation Trains between Philadelphia & Wilmington.—Philadelphia to Wilmington, 8 a.m., mail, 12½ p.m., 4 p.m., 7 p.m., 10 p.m. mail. Wilmington to Philadelphia, 7 a.m., 1 p.m., mail, 4½ p.m., 7 p.m., 12½ a.m., night mail.

J. R. TRIMBLE,  
Engineer and General Superintendent.

## **CONNECTION BETWEEN THE BOSTON and Lowell and the Boston and Maine Railroads.** On and after April

1st, 1847, passenger trains between these two roads, will run as follows, viz:

Leaving Lowell at 7, 11 1-4 a.m., and 3 1-2, 4 1-2, and 6 1-2 p.m., to connect at the junction in Wilmington with the eastward trains—at 7 a.m. and 2 1-2 p.m. with those to Portland; at 4 1-2 p.m. to Great Falls only, with a detention of 45 minutes at the junction, and at 11 1-4 a.m. and 6 1-2 p.m. to Haverhill only. Leaving the junction in Wilmington, for Lowell, at about 7 1-4 a.m. on arrival of the morning train from Haverhill; at about 9 a.m., on arrival of the morning trains from Great Falls. At about 11 3-4 a.m., on arrival of the morning train from Portland. At about 5 p.m. on arrival of the afternoon trains from Haverhill. At about 7 1-4 p.m. on arrival of the afternoon train from Portland.

WALDO HIGGINSON, Agent.

## **NEW YORK AND PHILADELPHIA RAILROAD** line—direct. Via Newark, New Brunswick, Princeton, Trenton,

and Bristol. (Through in six hours.) Leaving New York daily from the foot of Liberty street.

Morning line.....9 o'clock a.m.  
Mail pilot line.....4½ " p.m.

The lines proceed direct to Bristol without change of cars, and thence by the new steamer, "John Stevens," to Philadelphia.

### **FARE BETWEEN NEW YORK & PHILA.**

First class cars.....\$4 00  
Second class cars.....3 00

Passengers will procure their Tickets at the office foot of Liberty st., where a commodious steamboat will be in readiness with Baggage-crates on board.

Fifty pounds of baggage will be allowed to each passenger in this line, and passengers are expressly prohibited from taking anything as baggage but their wearing apparel, which will be at the risk of the owner.

Philadelphia Baggage-crates are conveyed from city to city, without being opened by the way. Each train is provided with a car, in which are apartments and dressing rooms expressly for ladies' use.

Returning, the lines leave Philadelphia from the foot of Walnut st. at 9 a.m. and 4 1-2 p.m.

The lines for Baltimore leave Philadelphia daily, except Sundays, at 8 a.m., 3½ and 10 p.m., and Sundays only at 10 p.m.—being a continuation of the line from New York. 25tf

## **LITTLE MIAMI RAILROAD.**—OPEN TO SPRINGFIELD—Distance 84 miles—

connecting at Xenia and Springfield with Messrs. Neil, Moore, & Co's. daily daylight lines of stages going east and north, to Columbus, Zanesville, Wheeling, Cleveland, and Sandusky City, via Urbana, Bellefontaine, Kenton, and the Mad river and Lake Erie railroad, or Columbus, Delaware, and the Mansfield and Sandusky City railroad—forming, by these connections, the cheapest and most expeditious route to Buffalo, Niagara Falls, Rochester, Albany, New York, and Boston.

On and after Thursday, August 13, 1846, until further notice, a Passenger train will run as follows: Leave Cincinnati daily at 9 A. M., for Milford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Old Town, Yellow Springs, and Springfield.

Returning, will leave Springfield at 4 hours 35 minutes A. M. A line of Hacks runs in connection with the Cars, between Deerfield and Lebanon.

Fare—From Cincinnati to Lebanon....	\$1 00
" " " Xenia.....	1 50
" " " Springfield....	2 00
" " " Columbus....	4 00
" " " Sandusky city 8 00	

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at of a passage for every \$500 in value over that amount.

The 1½ P. M. train from Cincinnati, and the 2 40 P. M. train from Xenia, will be discontinued on and after Monday, the 10th instant.

A freight train will run daily.  
47tf W. H. CLEMENT, Sup't.

## **BALTIMORE AND OHIO RAILROAD.**

**MAIN STEM.** The Train carrying the Great Western Mail leaves Bal-

timore every morning at 7½ and Cumberland at 8 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburgh and Hancock, connecting daily each way with—the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Pitsburgh. Time of arrival at both Cumberland and Baltimore 5½ P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pitsburgh \$10, and time about 32 hours. Through tickets from Philadelphia to Wheeling \$13, to Pitsburgh \$12. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

### **WASHINGTON BRANCH.**

Daily trains at 9 A. M. and 5 P. M. and 12 at night from Baltimore and at 6 A. M. and 5½ P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. 313y1

## **LEXINGTON AND OHIO RAILROAD.**

Trains leave Lexington for Frankfort daily, at 5 o'clock a.m., and 2 p.m.

Trains leave Frankfort for Lexington daily, at 8 o'clock a.m. and 2 p.m. Distance, 28 miles. Fare \$1-25.

On Sunday but one train, 5 o'clock a.m. from Lexington, and 2 o'clock p.m. from Frankfort.

The winter arrangement (after 15th September to 15th March) is 6 o'clock a.m. from Lexington, and ma. 9. from Frankfort, other hours as above. 351y

## AMERICAN RAILROAD JOURNAL.

PUBLISHED AT 105 CHESTNUT ST. PHILADELPHIA.

Saturday, July 10, 1847.

**LAP-WELDED WROUGHT IRON TUBES**  
for Tubular Boilers, from 14 to 15 inches diameter, and any length not exceeding 17 feet—manufactured by the Caledonian Tube Company, Glasgow, and for sale by

IRVING VAN WART,

19 Platt street, New York.

JOB CUTLER, Patentee.

These Tubes are extensively used by the British Government, and by the principal Engineers and Steam Marine and Railway Companies in the Kingdom.

**ATLANTIC AND ST. LAWRENCE RAILROAD.**—Notice to Contractors.—Proposals in writing will be received at the office of the Atlantic and St. Lawrence Railroad Company, in the city of Portland, until Tuesday, the tenth day of August next, inclusive, at sunset, for the grading, masonry, and bridging of that portion of their road extending from the termination of the second division near the hotel road in Danville, to a place in the vicinity of Norway and Paris cape, a distance of about 30 miles. Maps, profiles, and specifications will be ready for examination on and after the second day of August next, at the Engineer's office in Portland, where all necessary information will be given.

The company will require, as one of the stipulations of the contract, that the heavier work on any section, shall be first attended to, so that the heavier and lighter work may be completed at nearly the same time.

Persons unknown to the officers of the company must accompany their bids with satisfactory evidence of their ability to execute the work. In all cases good and sufficient bonds with two or more sureties will be required for the faithful performance and fulfilment of the contract.

Wm. P. PREBLE, President.

Portland, June 30, 1847.

## Railway Profits.

The Mining Journal, of 12th June, says that "the principal railway companies in the United Kingdom having lines completed and at work, are 28 in number; the length of their lines in operation is 2418½ miles, and the total cost to the dates of the last balance sheets is £77,162,952. The dividends now paid upon the different items of which this capital is made up, vary from two to ten per cent. in the following proportions:

On £1,079,867 the dividend is £2 0 per cent.	
On 853,918 " " 2 8 "	
On 520,341 " " 2 12 "	
On 142,900 " " 3 0 "	
On 4,741,249 " " 3 10 "	
On 1,174,969 " " 4 0 "	
On 5,705,057 " " 5 0 "	
On 1,085,498 " " 5 10 "	
On 2,005,127 " " 6 0 "	
On 26,276,102 " " 7 0 "	
On 2,426,000 " " 8 0 "	
On 2,062,053 " " 9 0 "	
On 23,059,571 " " 10 0 "	

£77,162,952

The total dividend upon the various items above enumerated amounts to £5,746,068 per annum, being an average of 7½ per cent., within a fraction, on the entire sum invested by the shareholders in these undertakings. It should be borne in mind, too, that the resources of many of these companies are as yet but imperfectly developed. In some cases the lines are but partially opened, and in others, such as the Great Western, though the main lines are complete, many of the tributaries essential to the full development of the system of which they form part, and from which much increased wealth and prosperity must necessarily flow, are as yet incomplete, and have brought nothing to the general fund."

## The Iron Trade.

We have our foreign files by the Caledonia up to 12th June, inclusive, from which we learn that the iron trade is not very brisk. Rails are quoted on the 4th at £9, average, and on the 11th at £9 a £9

5s. The monthly report of June 3d says that English bar iron has been in little demand during the month, and prices have fallen 5s. per ton. With a better demand has taken place, and makers now refuse to sell under £8 10s. at the works in Wales. The rail market has been exceedingly dull, principally owing to the difficulty the various companies experience in getting in their rails. Scotch pig iron declined to 63s. 6d. mixed numbers, and 64s. to 65s. No. 1; but within the last few days rather higher prices have been asked. Swedish iron and steel are dull of sale.

The remarks in the Mining Journal upon the subject of pig iron are that the fine weather, and consequent improvement in prospects, have had the effect of stiffening the price of pig iron this week. There was considerable demand on Monday and Tuesday, and sales were effected to some extent at 64s. and 64s. 6d. cash. To-day, although there is less inquiry, there is no greater disposition to sell, and in the absence of transactions, quote the price nominally at 65s. The iron masters have resolved upon making a reduction in the workmen's wages, to the extent of 25 per cent., which, apparently, will be submitted to.

In the same paper, of 12th June, we find it stated that Welsh and Staffordshire are without alteration, and the demand is very moderate for export. In Scotch pigs very little doing, but from there being no parcels pressing on the market the price is a little firmer.

## Michigan Southern Railroad.

The Michigan Southern railroad company held their annual meeting at Monroe on the 14th ultimo, and elected T. B. Van Brunt, president, and S. J. Holly, vice president. This company have had the road in their possession for about five months, during which period they have increased the number of freight cars from 48 to 85—each sufficient to carry two tons burden, and passage cars from three to four. They have contracted for two new engines to be furnished by the 1st of August, and 25 double freight cars—equal to 50 of the ordinary size.

"Up to the 1st of June, the company had received cash \$36,527 74, which with the State liabilities on hand, will enable them to meet the payment due the State. The expenses during the same time, for paying officers and hands, for cars, repairing road, building bridge, etc., amounted to about \$14,000.—During the first ten days of last month, the receipts upon the road were \$6,244 19, and the freight on the

road awaiting transportation, was estimated as sufficient to keep the cars in constant operation until after harvest."

Under good management this road will soon give large returns to its proprietors, and important advantages to the people along its line.

#### Railroads at the South--The Connecting Link.

We have often had occasion to refer to the great inconvenience to travel and business arising from the break in the line of railroads between North and South Carolina. With the exception of this deficiency—a comparatively short line—we have railroad accommodation from Portland in Maine, and from Buffalo in New York, very nearly to the Alabama line; and therefore this break is exceedingly annoying to those who have become accustomed to the luxury of railroad travelling. Just in proportion, then, to the inconvenience of the interruption, will be the pleasure, to business men, to learn that the people of North Carolina, at least—and we believe those of South Carolina also—are determined to remove the cause of so many complaints, as we learn from the last number of the Wilmington Chronicle. The editor of that paper says:

"Our readers will perceive, by the proceedings of the stockholders at Marion, that the work of the CONNECTING LINK goes 'bravely on.'"

"We are rejoiced to see our friends, thus far, verify their promises, and show to the world that it is not by words alone, but by deeds, that their regard for the great interest of internal improvement are to be demonstrated.

"The time is come when every one who intends to participate in the honor of accomplishing this great and useful work, should come up to the line, and 'tell steps' with their compeers. It is not now a question as to whether the road shall be built or not—this problem is already solved. But the questions are, *who* will help? *When* shall it commence?

"The answers to the first question we suppose are already in the mind of the reader. *Who* will help? Why everybody that has real estate, or capital to invest. Everybody that has to do something for a living, whether in mercantile, mechanical or farming pursuits. Everybody that has any sort of interest in this section, or the least regard for the prosperity of the people here. Everybody that loves the glory of the good old North State.

"As to the matter of ability—all can help some. When one cannot afford to take even a single share, perhaps two or three can do it. It will be a good investment for even the man who relies on manual labor for support. The completion of the road will more than remunerate him, in a short space, through the facilities and the increase of price of labor.

"As to *when* it shall be built—the answer is also ready. Now—at once—let the work begin at 'both ends,' as recommended in the resolution offered by General McRae and adopted at the meeting at Marion. This is a most excellent plan, and will create a spirit of emulation among the citizens of the 'extremes.' There will be an honorable and fraternal striving for the mastery, as to who shall first proximate the centre.

"When we say that we rejoice in the selection of Gov. E. B. Dudley for president of the new road, we do not utter a commonplace sentiment or express a conventional compliment. For ourselves, and we dare venture the same for all the company as well as the whole community interested, it is the pleasure of the heart and the conviction of the mind, that hails the appointment as the harbinger of good things for our new road.

"We learn that during the meeting at Marion, several animated and interesting discussions arose, which were participated in by Gov. Dudley, Messrs. McRae, Nutt, Fulton and Wright, of North Carolina, and Sims, Harlee, J. A. Dargen, and others, of South Carolina; the general tenor of whose remarks proved that the zeal of the people of their respective sections, was unabated, and the determination to build the road at all events, stronger than ever."

We publish at length the proceedings of the convention at Marion in another page.

#### Railroad Extension and Railroad Mail Transportation.

We find a brief report in the National Intelligencer of 3d inst., of the proceedings of a meeting held in Washington, in February last, for the purpose of recommending an application to Congress for the appropriation of a portion of the public lands to aid in the construction of railroads, and thus facilitate the transportation of the mail. This is a measure in which we heartily concur—and we hope efficient measures may be adopted to carry it into operation. The editor of the Intelligencer says:

"Our attention has been invited to the following account of the proceedings of a meeting, which, it appears, was held in this city in February last, looking to the calling of a general railroad convention, should it be deemed expedient, at some time before the next session of Congress, for the purposes stated in the resolutions; to make known which we give the proceedings a place in our columns."

At a meeting of persons interested in the extension of railroads, held in the city of Washington on the 26th day of February, 1847, the Hon. Robert Smith, of Illinois, was called to the chair, and Gen. Duff Green appointed secretary, when the following resolutions were moved and adopted:

**Resolved**, That in the opinion of this meeting application should be made to Congress, at its next session, to enact a law granting aid by a donation of public lands for the construction of railroads passing through or near such public lands, and on condition that facilities for carrying the mails of the United States on such routes be given.

**Resolved**, As the opinion of this meeting, that the existing laws relating to postoffice contracts with railroad companies may be so modified as greatly to benefit railroad companies, and at the same time greatly reduce the cost of transporting the mails.

**Resolved**, As the opinion of this meeting, that a committee should be appointed, whose duty it shall be to obtain, as far as practicable, full and detailed statements of the condition of the several railroad companies now authorized by law, and of the plans, estimates and prospective utility of such railroads as it is proposed to establish hereafter, and to prepare a digest of the information thus obtained, to be submitted to a convention of persons interested in such railroads or to the next Congress.

**Resolved**, That it shall be the duty of said committee, if, after consulting with the post-office department, and persons throughout the several States, they shall deem it expedient, to call a meeting to be held in this city, to be composed of delegates sent by the several railroad companies and persons interested in the extension of railroads, at or before the meet-

ing of the next Congress, for the purpose of preparing and submitting to Congress a memorial, and such statistical and practical information as will enable Congress to pass proper laws on the subject.

When a committee consisting of the following named persons was appointed.

Hon. Robert Smith, of Illinois.

Gen. James Gadsden, of Charleston, S. C.

J. H. Bodley, Esq., of Vicksburg, Miss.

C. L. Hinton, of Raleigh, N. C.

Gen. Duff Green, of Washington.

Dr. Wm. Collins, of Washington.

Gen. Simon Cameron, of Pennsylvania.

Hon. Elish B. Whittlesey, of Ohio.

Col. James E. Murray, of New York.

Judge James Harwood, of Baltimore.

ROBERT SMITH, Chairman.

DUFF GREEN, Secretary.

#### Electricity and Electric Telegraph.

We copy the following interesting article "on the induction of Atmospheric Electricity on the wires of the Electrical Telegraph," by PROFESSOR HENRY, from the January number of "the American Journal of Science and Arts." The name of the writer, and of the Journal in which it was first published, will ensure it an attentive perusal by all who take an interest in the subject of which it treats, and no man can read it without instruction.

The writer says, "The action of the electricity of the atmosphere on the wires of the electrical telegraph, is at the present time a subject of much importance, both on account of its practical bearing, and the number of purely scientific questions which it involves. I have accordingly given due attention to the letter referred to me, and have succeeded in collecting a number of facts in reference to the action in question. Some of these are from the observations of different persons along the principal lines, and others from my own investigations during a thunder-storm on the 19th of June, when I was so fortunate as to be present in the office of the telegraph in Philadelphia, while a series of very interesting electrical phenomena was exhibited. In connexion with the facts derived from these sources, I must ask the indulgence of the society in frequently referring, in the course of this communication, to the results of my previous investigations in dynamic electricity, accounts of which are to be found in the proceedings and transactions of this Institution.

From all the information on the subject of the action of the electricity of the atmosphere on the wires of the telegraph, it is evident that effects are produced in several different ways.

1. The wires of the telegraph are liable to be struck by a direct discharge of lightning from the clouds, and several cases of this kind have been noticed during the present season. About the 20th of May, the lightning struck the elevated part of the wire, which is supported on a high mast at the place where the telegraph crosses the Hackensack river. The fluid passed along the wire each way, from the point which received the discharge, for several miles, striking off at irregular intervals down the supporting poles. At each place where the discharge

to a pole took place, a number of sharp explosions were heard in succession, resembling the rapid reports of several rifles. During another storm the wire was struck in two places in Pennsylvania, on the route between Philadelphia and New York; at one of these places twelve poles were struck, and at the other eight. In the latter case the remarkable fact was observed, that every other pole escaped the discharge; and the same phenomena was observed, though in a less marked degree, near the Hackensack river. In some instances the lightning has been seen coursing along the wire in a stream of light; and in another case it is described as exploding from the wire at certain points, though there were no bodies in the vicinity to attract it from the conductor.

In discussing these, and other facts to be mentioned hereafter, we shall, for convenience, adopt the principles and language of the theory which refers the phenomena of electricity to the action of a fluid, of which the particles repel each other, and are attracted by the particles of other matter. Although it cannot be affirmed that this theory is an actual representation of the cause of the phenomena as they are produced in nature, yet it may be asserted that it is, in the present state of science, an accurate mode of expressing the laws of electrical action, so far as they have been made out; and that though there are a number of phenomena which have not as yet been referred to this theory, there are none which are proved to be directly at variance with it.

That the wires of the telegraph should be frequently struck by a direct discharge of lightning, is not surprising, when we consider the great length of the conductor, and, consequently, the many points along the surface of the earth through which it must pass, peculiarly liable to receive the discharge from the heavens. Also, from the great length of the conductor, the more readily must the repulsive action of the free electricity of the cloud drive the natural electricity of the conductor to the farther end of the line, thus rendering more intense the negative condition of the nearer part of the wire, and, consequently, increasing the attraction of the metal for the free electricity of the cloud. It is not, however, probable, that the attraction, whatever may be its intensity, of so small a quantity of matter as that of the wire of the telegraph, can of itself produce an electrical discharge from the heavens: although if the discharge were started by some other cause, such as the attraction of a large mass of conducting matter in the vicinity, the attraction of the wire might be sufficient to change the direction of the descending bolt, and draw it in part or whole, to itself. It should also be recollected, that on account of the perfect conduction, a discharge on any part of the wire must affect every other part of the connected line, although it may be hundreds of miles in length.

That the wire should give off a discharge to a number of poles in succession, is a fact I should have expected, from my previous researches on the literal discharge of a con-

ductor transmitting a current of free electricity. In a paper on this subject, presented to the British Association in 1837, I showed that when electricity strikes a conductor explosively, it tends to give off sparks to all bodies in the vicinity, however intimately the conductor may be connected with the earth. In an experiment in which sparks from a small machine were thrown on the upper part of a lightning rod, erected in accordance with the formula given by the French Institute, corresponding sparks could be drawn from every part of the rod, even from that near the ground. In a communication since made to this society, I have succeeded in referring this phenomenon to the fact, that during the transmission of a quantity of electricity along a rod, the surface of the conductor is charged in succession, as it were, by a wave of the fluid, which, when it arrives opposite a given point, tends to give off a spark to a neighboring body, for the same reason that the charged conductor of the machine gives off a spark under the same circumstances.

It might at first be supposed that the redundant electricity of the conductor would exhaust itself in giving off the first spark, and that a second discharge could not take place; but it should be observed, that the wave of free electricity, in its passage, is constantly attracted to the wire by the portion of the uncharged conductor which immediately precedes its position at any time; and hence but a part of the whole redundant electricity is given off at one place; the velocity of transmission of the wave as it passes the neighboring body, and its attraction for the wire, preventing a full discharge at any one place. The intensity of the successive explosions is explained by referring to the fact, that the discharge from the clouds does not generally consist of a single wave of electricity, but of a number of discharges along the same path in rapid succession, or of a continuous discharge which has an appreciable duration; and hence the wire of the telegraph is capable of transmitting an immense quantity of the fluid thus distributed over a great length of the conductor.

The remarkable facts of the explosions of the electricity into the air, and of the poles being struck in interrupted succession, find a plausible explanation in another electrical principle which I have established, namely, in all cases of the disturbance of the equilibrium of the electrical plenum, which we must suppose to exist throughout all terrestrial space, the state of rest is attained by a series of diminishing oscillations. Thus, in the discharge of a Leyden jar, I have shown that the phenomena exhibited cannot be explained by merely supposing the transfer of a quantity of fluid from the inner to the outer side of the jar; but in addition to this we are obliged to admit the existence of several waves, backwards and forwards, until the equilibrium is attained. In the case of the discharge from the cloud, a wave of the natural electricity of the metal is repelled each way from the point on which the discharge falls, to either end of the wire, is then reflect-

ed, and in its reverse passage meets in succession the several waves which make up the discharge from the cloud. These waves will therefore interfere at certain points along the wire, producing, for a moment, waves of double magnitude, and will thus enhance the tendency of the fluid at these points to fly from the conductor. I do not say that the effects observed were actually produced in this way; I merely wish to convey the idea that known principles of electrical action might, under certain circumstances, lead us to anticipate such results.

2. The state of the wire may be disturbed by the conduction of a current of electricity from one portion of space to another, without the presence of a thunder-cloud; and this will happen in case of a long line, when the electrical condition of the atmosphere which surrounds the wire at one place is different from that at another. Now it is well known that a mere difference in elevation is attended with a change in the electrical state of the atmosphere. A conductor, elevated by means of a kite, gives sparks of positive electricity in a perfectly clear day; hence, if the line of the telegraph passes over an elevated mountain ridge, there will be continually during clear weather, a current from the more elevated to the lower points of the conductor.

A current may also be produced in a long level line, by the precipitation of vapor in the form of fog at one end, while the air remains clear at the other; or by the existence of a storm of rain or snow at any point along the line, while the other parts of the wire are not subjected to the same influence.

Currents of sufficient power to set in motion the marking machine of the telegraph have been observed, which must have been produced by some of these causes. In one case the machine spontaneously began to operate without the aid of the battery, while a snow storm was falling at one end of the line, and clear weather existed at the other. On another occasion a continued stream of electricity was observed to pass between two points at a break in the wire, presenting the appearance of a gas-light almost extinguished. A constant effect of this kind indicates a constant accession of electricity at one part of the wire, and a constant discharge at the other.

3. The natural electricity of the wire of the telegraph is liable to be disturbed by the ordinary electrical induction of a distant cloud. Suppose a thunder-cloud, driven by the wind in such a direction as to cross one end of the line of the telegraph at the elevation, say of a mile; during the whole time of the approach of the cloud to the point of its path directly above the wire, the repulsion of the redundant electricity with which it is charged would constantly drive more and more of the natural electricity of the wire to the farther end of the line, and would thus give rise to a current. When the cloud arrived at the point nearest to the wire, the current would cease for a moment; and as the repulsion gradually diminished by the receding of the cloud, the natural electricity of the wire would gradually return to its normal state, giving rise to a current in an opposite direction. If the

cloud were driven by the wind parallel to the line of the telegraph, a current would be produced towards each end of the wire, and these would constantly vary in intensity with the different positions of the cloud. Although currents produced in this way may be too feeble to set in motion the marking apparatus, yet they may have sufficient power to influence the action of the current of the battery so as to interfere with the perfect operation of the machine.

4. Powerful electrical currents are produced in the wires of the telegraph by every flash of lightning which takes place within many miles of the line, by the action of dynamic induction; which differs from the action last described, in being the result of the influence of electricity in motion on the natural electricity of the conductor. The effect of this induction, which is the most fruitful source of disturbance, will be best illustrated by an account of some experiments of my own, presented to the society in 1843. A copper wire was suspended by silk strings around the ceiling of an upper room, so as to form a parallelogram of about sixty feet by thirty on the sides; and in the cellar of the same building, immediately below, another parallelogram of the same dimensions was placed. When a spark from an electrical machine was transmitted through the upper parallelogram, an induced current was developed in the lower one, sufficiently powerful to magnetize needles, although two floors intervened, and the conductors were separated to the distance of thirty feet. In this experiment no electricity passed through the floors from one conductor to the other; the effect was entirely due to the repulsive action of the electricity in motion in the upper wire on the natural electricity of the lower. In another experiment, two wires about 400 feet long, were stretched parallel to each other between two buildings; a spark of electricity sent through one produced a current in the other, though the two were separated to the distance of 300 feet; and from all the experiments, it was concluded that the distance might be indefinitely increased, provided the wires were lengthened in a corresponding ratio.

That the same effect is produced by the repulsive action of the electrical discharge in the heavens, is shown by the following modification of the foregoing arrangement. One of the wires was removed, and the other so lengthened at one end, as to pass into my study, and thence through a cellar window into an adjacent well. With every flash of lightning which took place in the heavens, within at least a circle of twenty miles around Princeton, needles were magnetized in the study by the induced current developed in the wire. The same effect was produced by soldering a wire to the metallic roof of the house, and passing it down into the well; at every flash of lightning a series of currents in alternate directions was produced in the wire.

I was also led, from these results, to infer that induced currents must traverse the line of a railroad, and this I found to be the case.

Sparks were seen at the breaks in the continuity of the rail, with every flash of a distant thunder-cloud.

Similar effects, but in a greater degree, must be produced on the wire of the telegraph, by every discharge in the heavens; and the phenomena which I witnessed on the 19th of June in the telegraph office in Philadelphia, were, I am sure, of this kind. In the midst of the hurry of the transmission of the congressional intelligence from Washington to Philadelphia, and thence to New York, the apparatus began to work irregularly. The operator at each end of the line announced at the same time a storm at Washington, and another at Jersey City. The portion of the circuit of the telegraph which entered the building, and was connected with one pole of the galvanic battery, happened to pass within the distance of less than an inch of the wire which served to form the connexion of the other pole with the earth. Across this space, at an interval of every few minutes, a series of sparks in rapid succession was observed to pass; and when one of the storms arrived so near Philadelphia that the lightning could be seen, each series of sparks was found to be simultaneous with a flash in the heavens. Now we cannot suppose, for a moment, that the wire was actually struck at the time each flash took place; and indeed it was observed that the sparks were produced when the cloud and flash were at the distance of several miles to the east of the line of the wire. The inevitable conclusion is, that all the exhibition of electrical phenomena witnessed during the afternoon, was purely the effect of induction, or the mere disturbance of the natural electricity of the wire at a distance, without any transfer of the fluid from the cloud to the apparatus.

The discharge between the two portions of the wire continued for more than an hour, when the effect became so powerful, that the superintendent, alarmed for the safety of the building, connected the long wire with the city gas pipes, and thus transmitted the current silently to the ground. I was surprised at the quantity and intensity of the current; it is well known, that to affect a common galvanometer with ordinary electricity, requires the discharge of a large battery; but such was the quantity of the induced current exhibited on this occasion, that the needle of an ordinary vertical galvanometer, with a short wire, and apparently of little sensibility, was moved several degrees.

The pungency of the spark was also, as might have been expected, very great. When a small break was made in the circuit, and the parts joined by the fore-finger and thumb, the discharge transmitted through the hand affected the whole arm up to the shoulder. I was informed by the superintendent, that on another occasion a spark passed over the surface of the spool of wire, surrounding the legs of the horse-shoe magnet at right angles to the spires; and such was its intensity and quantity, that all the wires across which it passed were melted at points in the same straight line as if they had been cut in two by a sharp knife.

The effects of the powerful discharges from the clouds may be prevented in a great degree, by erecting at intervals along the line, and aside of the supporting poles, a metallic wire, connected with the earth at the lower end, and terminating above at the distance of about half an inch from the wire of the telegraph. By this arrangement the insulation of the conductor will not be interfered with, while the greater portion of the charge will be drawn off. I think this precaution of great importance at places where the line crosses a river, and is supported on high poles. Also in the vicinity of the office of the telegraph, where a discharge, falling on the wire near the station, might send a current into the house of sufficient quantity to produce serious accidents. The fate of Prof. Richman, of St. Petersburg, should be recollected, who was killed by a flash from a small wire, which entered his house from an elevated pole, while he was experimenting on atmospheric electricity.

The danger, however, which has been apprehended from the electricity leaving the wire and discharging itself into a person on the road, is, I think, very small; electricity of sufficient intensity to strike a person at eight or ten feet from the wire, would, in preference, be conducted down the nearest pole. It will, however, in all cases, be most prudent to keep at a proper distance from the wire during the existence of a thunder-storm in the neighborhood.

It may be mentioned as an interesting fact, derived from two independent sources of information, that large numbers of small birds have been seen suspended by the claws from the wire of the telegraph. They had, in all probability, been instantaneously killed, either by a direct discharge, or an induced current from a distant cloud, while they were resting on the wire.

Though accidents to the operators, from the direct discharge, may be prevented by the method before mentioned, yet the effect on the machine cannot be entirely obviated; the residual current which escapes the discharge along the perpendicular wires, must neutralize, for a moment, the current of the battery, and produce irregularity of action in the apparatus.

The direct discharge from the cloud on the wire is, comparatively, not a frequent occurrence, while the dynamic inductive influence must be a source of constant disturbance during the season of thunder storms; and no other method presents itself to my mind at this time for obviating the effect, but that of increasing the size of the battery, and diminishing the sensibility of the magnet, so that, at least, the smaller induced currents may not be felt by the machine. It must be recollected, that the inductive influence takes place at a distance through all bodies, conductors and non conductors; and hence no coating that can be put upon the wire will prevent the formation of induced currents.

I think it not improbable, since the earth has been made to act the part of the return conductor, that some means will be discovered for insulating the single wire beneath the

surface of the earth; the difficulty in effecting this is by no means as great as that of insulating two wires, and preventing the current striking across from one to the other. A wire, buried in the earth, would be protected, in most cases, from the effect of a direct discharge; but the inductive influence would still be exerted, though perhaps in a less degree.

The wires of the telegraph are too small and too few in number to affect, as some have supposed, the electrical condition of the atmosphere, by equalizing the quantity of the fluid in different places, and thus producing a less changeable state of the weather. The feeble currents of electricity which must be constantly passing along the wires of a long line, may, however, with proper study, be the means of discovering many interesting facts relative to the electrical state of the air over different regions.

**Wilmington and Manchester Railroad,  
Or the Connecting Link between the Northern and the  
Southern Railroads.**

We hope there may be no relaxation in the efforts of those immediately on the line of this work—and hope also that capitalists and railroad companies at the north will give the subject not only their consideration, but also subscribe liberally to the stock.

At a general meeting of the stockholders of the Wilmington and Manchester railroad company, held at Marion C. H. South Carolina, on Wednesday, June 23d, 1847:

On motion of Gov. E. B. Dudley, Wm. Haynsworth, Esq., of Sumter District, was called to the chair.

Wm. H. Wingate, of Darlington, and R. B. Boylston, of Marion were appointed secretaries.

On motion of Gen. W. W. Harlee,  
*Resolved*, That the commissioners appointed to receive subscriptions to the capital stock of the company do report the amounts subscribed for, in their respective districts to the secretaries. Whereupon the following were reported:

Wilmington,	\$156,200
Columbus county, N. C.,	17,000
Marion district, S. C.,	46,600
Darlington district, S. C.,	42,600
Sumter district, S. C.,	57,300

**\$319,700**

On motion of W. A. Wright, Esq.,  
*Resolved*, That the report of the secretaries be received.

On motion of Hon. A. D. Sims,  
*Resolved*, That the stockholders present do report themselves to the secretaries of this body, and that the chairman call on those from the town of Wilmington and county of Columbus, N. C., and the districts of Marion, Darlington and Sumter, S. C., so to report themselves. Whereupon the stockholders present recorded their names.

On motion of G. J. McRae, Esq.,  
*Resolved*, That a committee consisting of one each from the town of Wilmington and Columbus county in N. C., and the districts of Marion, Darlington and Sumter, in S. C., be appointed to ascertain and report the

amount of stock represented at this meeting, and to verify proxies.

Under the resolution, the chair appointed Messrs. Alexander McRae, Alfred Smith, S. F. Gibson, A. D. Sims and Wm. Harris, who reported that 788 shares were represented in person, and 1712 by proxy, making in all 2500 shares represented.

On motion,  
*Resolved*, That a committee of two from each section represented at this meeting, be appointed to nominate a president and directors.

The chairman appointed Messrs. W. A. Wright, H. L. Holmes, Absalom Powell, Alfred Smith, W. W. Harlee, W. W. Durant, J. S. Gibson, Wm. H. Evans, W. Harris and J. E. Witherspoon.

On motion of H. Nutt, Esq.,  
*Resolved*, That the subscribers for stock in this company shall not be called on for payment in larger sums than 5 per cent. on the amount subscribed, nor at shorter intervals than three months; the second instalment to be called for in three months after the commencement of the work.

On motion of Gen. Harlee,  
*Resolved*, That in all contracts for labor or materials to be used in the construction of the road, preference shall be given to the stockholders.

On motion of Gen. McRae,  
*Resolved*, That when it shall be deemed advisable by the board of directors to put the road under contract that it shall be commenced at both ends, and that the expenditures at each end shall be in proportion to the amount subscribed in each State.

The meeting then adjourned until 9 o'clock A. M. to-morrow.

**THURSDAY, 9 o'clock A. M.**

The meeting was called to order by the chairman, and the proceedings of yesterday read and approved.

On motion of J. Eli Gregg, Esq.,  
*Resolved*, That a committee of seven be appointed by the chair to report what officers should be created by the company, and the salary to be allowed each. The chairman appointed Messrs. J. Eli Gregg, Alexander McRae, E. A. Lan, J. E. Witherspoon, H. Nutt, A. L. Scarborough and J. Maultsby to compose that committee, who recommended the establishment of the following officers with the salaries respectively attached.

A president, with a salary of \$2500 per annum.

A general Agent, \$1500,

A secretary and treasurer, (the duties of both to be discharged by the same person,) \$1500.

A chief engineer, \$2500.

A principal assistant, do., \$1500.

The committee further recommended that the time from which the services and salaries of these officers shall commence, shall be fixed by the president and directors.

The report was unanimously adopted.

On motion of Hon. A. D. Sims.

*Resolved*, That until the completion of the road, or until otherwise ordered, the necessa-

ry travelling expenses of the directors attending any meeting of the directory on business of the company, shall be paid by the company.

The committee appointed to nominate a president and directors of the Wilmington and Manchester railroad company recommended the election of the following officers.

**FOR PRESIDENT.**

Gov. E. B. Dudley, of Wilmington.

**FOR DIRECTORS.**

Henry Nutt, D. Fulton, John McRae, Sr., of Wilmington; J. Maultsby, of Columbus county; J. Eli Gregg, A. L. Scarborough, of Marion, C. H.; G. W. Dargan, J. S. Gibson, of Darlington, S. C.; J. J. Moore, R. B. Muldrow, of Sumter, C. H.

The report of the committee was unanimously adopted, and the above named gentlemen declared duly elected.

On motion of W. A. Wright, Esq.,  
*Resolved*, That a committee of three be appointed to draft bye-laws for this company, and that they make a report to the next general meeting of the stockholders. Under this resolution, Messrs. W. A. Wright, H. L. Homes and Alexander McRae were appointed.

On motion of A. J. De Rossett, Esq.,  
*Resolved*, That the next annual meeting of this company be held at Darlington C. H. South Carolina, on the first Thursday after the third Monday in June, 1848.

On motion of C. D. Evans, Esq.,  
*Resolved*, That the proceedings of this meeting be published in the Charleston, Wilmington and Sumter papers, and that 300 copies be printed in pamphlet form for distribution among the stockholders.

On motion of J. E. Witherspoon, Esq.,  
*Resolved*, That it be recommended to the board of directors to appoint agents to open books, and solicit subscriptions for stock, in the districts of Williamsburg and Henry S. C. and for the counties of Brunswick and Robeson N. C. and in the city of Charleston.

On motion of Gen. Harlee,  
*Resolved*, That the amount subscribed and paid for the preliminary survey of the routes shall be received in part payment of their stock by the persons who may have respectively contributed to the survey.

On motion of Hon. A. D. Sims,  
*Resolved*, That the thanks of this meeting be and the same are hereby returned to the chairman and secretaries for the courteous and efficient manner in which they have respectively performed their duties.

Adjourned sine die.

WM. HAINSWORTH, Chairman.

W. H. WINGATE, }  
W. B. BOYLSTON, } Secretaries.

**MEETING OF DIRECTORS.**

At the first meeting of the board of directors of the Wilmington and Manchester railroad company, held at Marion Court House, on Thursday, the 24th June, 1847, the following persons were present:

E. B. Dudley, president; H. Nutt, D. Fulton, Josiah Maultsby, J. Eli Gregg, A. L. Scarborough and J. S. Gibson, Directors.

*Resolved*, That the secretary and treasurer's bond shall be given for twenty thousand dollars, with security approved by this board.

*Resolved*, That William H. Wingate be, and is hereby appointed secretary and treasurer of this company, from and after the last Wednesday of July next.

*Resolved*, That John C. MacRae be, and is hereby appointed general superintendent of this company.

*Resolved*, That the books of subscriptions to the capital stock of this company be re-opened, under the direction of each of the directors, and also

At Lumberton, under the direction of Dr. McQueen, L. B. Williams and J. Lee.

In Williamsburg district, under the direction of Solomon Coward.

In Darlington district, under the direction of J. M. Timmons.

In Sumter district, under the direction of Col. Lacoster, Captain Harries and William Hainsworth.

In Brunswick county, under the direction of Duncan Moore, Wm. B. Robinson and Frederick Hudler.

In Charleston, under the direction of T. Harlee, W. C. Duke and E. L. Adams.

At Fair Bluff, under the direction of Absalom Powell and Augustus Smith.

And at such other places as the president and general superintendent shall designate and direct, and under such terms and conditions as they may think best.

The meeting adjourned to meet in Wilmington, on the last day of July next.

#### Richmond, Fredericksburg, and Potomac Railroad.

##### FOURTEENTH ANNUAL REPORT.

We have recently received the 14th annual report of this company, which shows it in a very prosperous condition. It is not as full in its details as we should like to see it; as we hold it to be due to the railroad interest from every road in operation, to publish such details as may be calculated to throw light in the way of others, upon the subject. There is too often a habit—we will not say a disposition—to withhold useful facts, the result of experience on every well managed road; and we shall be pleased to see the habit changed, for one of a greater detail.

We notice a change in the president of this road, and we hope it may promote the interest of the company—but he must be an able, and an experienced man, who promises to do it, and fulfils his engagement.

The meeting was organized at half past 12 o'clock, by calling JAMES LYONS, Esq. to the Chair, and the appointment of C. W. MACMURDO as Secretary.

The Chair appointed Messrs. Wm. H. Macfarland, Conway Robinson and Holden Rhodes a committee to examine such powers as may have been given by Stockholders to represent them.

The committee, after examining the proxies, made a report, which was approved by the meeting, and the proxies appearing by the report of the committee to be properly authorized, were empowered to vote as such.

It appeared that the whole number of votes which could be given was 2276 votes, of which were present the Board of Public

Works by their proxy, James Lyons, Esq., entitled to 554 votes, and individual Stockholders entitled to 1476 votes, making in all 2030 votes present.

The President and Directors made the following

##### ANNUAL REPORT.

The Board of Directors submit herewith the usual tabular statements, showing the condition of the Company on the 31st of March last, and detailed statements of the business of the past year.

It will be seen from them, that the income of the Company was \$206,858 52 for the year ending 31st of March last, being an increase of \$7,924 52 on that of the previous year, and the whole current expenses of the Company were \$86,742 53, leaving a net profit on the business of the year of \$120,115 99.

The amount paid on account of interest on loans and new stock was \$34,218 94, which, deducted from the amount of profit above stated, leaves a balance of \$85,897 05, out of which the Board declared, in November last, a dividend of  $3\frac{1}{2}$  per cent., and on the first instant, a like dividend of  $3\frac{1}{2}$  per cent., leaving a balance (to be passed to the credit of profit and loss) of \$34,797 05 on the operations of the year. The net profit above mentioned would have justified a larger dividend than that which has been made, but the stock of materials on hand had been reduced within the past year, in amount, about \$12,000—and the Board deem it the true policy of the Company to make no dividend, which there is not an almost certain prospect of being steadily continued. This principle is adhered to, in their opinion, by semi-annual dividends, for the present, of  $3\frac{1}{2}$  per cent. only. They trust, however, that the period is not far distant, when they can increase them without any risk of retrograding from the point which they may attain. In the meanwhile the situation of the company, in the opinion of the Board, abundantly justifies the issue to the stockholders of certificates of debt, convertible into stock, for a portion of the amount standing to the credit of profit and loss, under the authority given at the annual meeting of the stockholders in May, 1845. This they have directed to be done, to the extent of ten per cent. on the old stock, and the first ten dollars per share of the new stock.

The Board regret that the combination between the Baltimore Steam Packet Company and James River boats, adverted to in the last report to the stockholders, still continues. In an examination before a joint committee of the Legislature, during the past winter, it was admitted by the James River boats that they had received from the Baltimore Steam Packet Company, during the past summer, a bounty of seventy-five cents per passenger, on each passenger conveyed between Richmond and Norfolk and Old Point Comfort, in addition to their regular fare on James River, and that this bounty on local passengers, in addition to the increased proportion received by them on passengers between Richmond and Petersburg, and Baltimore, beyond their regular fare, was equiv-

alent to an advantage of from ten to twelve thousand dollars per annum to the James River boats. It is understood that even greater advantages have been allowed to the river boats by the bay company. It seems evident, under these circumstances, with such efforts made by a foreign incorporated company to divert the travel from the railroad line north of Petersburg, that the measures which were adopted by the Board of Directors of this company, and which were approved by the stockholders at their meeting in July last, were indispensable to its protection.

Application having been made to this company, since the last meeting of stockholders by the proprietors of Morse's patent for liberty to construct a telegraph line along the line of the railroad, the attention of the Board of Directors has been much drawn to the subject. Had the Board of Public Works deemed it judicious to take an interest on the part of the state in the telegraph, the Board of Directors of this company would, in a spirit of courtesy towards the Board, have granted the right of way to the telegraph company, subject to revocation on twelve months' notice. But they are satisfied that serious objections apply to such grant of the right of way. There is, in the opinion of the Board of Directors, no reason to doubt, that, ere long, other plans of telegraph will be introduced, equal and perhaps superior to that of Professor Morse. Had the right of way been given to the proprietors or purchasers of Morse's patent, the Board could not consistently have refused it to the owners or purchasers of other plans of telegraph, and the line of railroad might have become encumbered with the posts and wires of several lines of telegraph, and the danger of accidents from the falling of the posts and wires, and the entanglement of locomotives and cars in them, have become a serious one. On the other hand, the company, by declining a right of way to any telegraph company, but retaining to itself the benefits of its line and its police, so invaluable to a perfect telegraph, will, it is believed, ere long, be enabled to derive a handsome revenue from constructing and keeping in order on its road, a line of posts with as many wires as may be required for the most complete working of either one or more telegraphs; the wires to be worked by the patentees (or their assigns) of such plans as may be adopted, and the railroad company to share in the profits of the several telegraphs, in proportions to be agreed on. The Board of Directors are inclined to think, that on this, or some similar plan, the great advantages possessed by lines of railroad, for the construction and maintenance of telegraph lines, will be made available for their benefit, and that of the public. In this connexion they beg leave to refer to an accompanying editorial article, [marked A.] from the Railroad Journal of 10th April last, which seems to them to present some views entitled to much consideration.

Mr. Moncure Robinson, the late president of the company, having expressed a wish to retire. At a meeting of the Board of Direct-

ors, on the 2d of December, his resignation was accepted, and Mr. Edwin Robinson appointed the president of the company in his place. The letter of Mr. Moncure Robinson, communicating his wish to retire from the office of president, and the report of the committee to whom the same was referred, [marked B.] are herewith communicated for the information of the stockholders.

Signed by direction and on behalf of the Board,  
ED. ROBINSON, President.

Rents of real estate, received during the year.....392 00

Income for the year ending 1st April, '47, \$206,858 52  
Deduct current expenses for year ending 1st April, 1847.....86,742 53  
Net revenue, after payment of current expenses.....\$120,115 99

DETAILED STATEMENT,

Showing the current expenses from 1st April, 1846, to 1st April, 1847, paid out of the income of the Richmond, Fredericksburg, and Potomac Railroad Company.

Current expenses for the year ending 31st March, 1847.	1st April to 1st October, 1846.	1st October, 1846, to 1st April, 1847.	Total for twelve months.
Officers' salaries, embracing the president, superintendent, treasurer, and assistant treasurer.....	\$4,100 00	\$4,100 00	\$8,200 00
Office expenses, embracing printing, advertising, postage, newspapers, stationery, etc.....	278 14	305 95	584 09
Depot expenses, embracing compensation of agents, repairs, water rent in Richmond, and hands at country depots.....	6,016 38	5,526 95	11,543 33
Repairs of road, embracing timber, iron, compensation of managers and overseers, hire and support of hands, and support of hands, etc.....	10,890 39	13,234 65	24,125 04
Train expenses, embracing compensation and expenses of captains and engine drivers, and cost of wood and oil.....	8,863 73	11,188 41	20,052 14
Repairs of engines, cars, etc., embracing compensation of foreman of shops, workmen, and materials used in repairs, etc.....	13,137 86	7,289 22	20,427 08
Current contingent expenses.....	387 67	423 28	810 95
Omnibus account.....	500 00	500 00	1,000 00
	\$14,171 17	\$42,568 36	\$56,742 53

Annual Reports of the New York Railroads.

SARATOGA AND SCHENECTADY RAILROAD COMPANY.

Hon. N. S. BENTON, Secretary of State.

Sir—In compliance with a resolution of the Assembly passed February 2d, 1843, the Saratoga and Schenectady Railroad Company make their annual report to you as follows:

The Saratoga and Schenectady railroad, extending from the village of Saratoga Springs to the city of Schenectady, is 22 miles long.

The cost of construction is.....\$300,000 00

The receipts of the company from January 1st, 1846, to Dec. 31st, 1846, both days included, are

From passengers, on 17,150 through.....\$18,699 99

" " 18,827 way.....8,750 01

From freight.....4,668 74

The expenditures of the company for the same period are,

For repairing and running the road.....\$26,358 41

For dividend in January, 1846.....8,000 00

" December.....9,000 00

The number of locomotives is.....3

" passenger cars.....4

" freight cars.....10

" machine shops.....1

The average number of men in employment of company is..... 26  
The number of miles run by passenger trains (freight is run in same train with passengers) is..... 24,455  
L. R. SARGENT, Sup't.

#### SCHENECTADY AND TROY RAILROAD COMPANY.

In compliance with a resolution of the Assembly passed February 2, 1843, the Schenectady and Troy railroad company submit the following report for the year 1846:

Length of road in operation, 20½ miles.  
Cost of construction to January 1, 1846, \$641,540 02  
Expended for construction in 1846..... 2,007 54  
The receipts of the road from January 1st, 1846, to December 31st, 1846, both days included, are  
From passengers, 57,793 through..... \$27,997 96  
" 4,996 way..... 1,490 19  
From freight..... 6,730 88  
From mail and all other sources..... 570 00

The expenditures for the same period are,  
For repairing and running the road..... \$31,545 30  
Number of locomotives..... 3  
" passenger cars..... 7  
" freight cars..... 19  
" other cars..... 24  
" machine shops..... 1  
Average number of men per day for the year..... 25  
Number of miles run by passenger trains..... 51,253  
Number of miles run by freight trains..... 2,460  
Dividends, none.  
W. E. HALL,  
Treasurer and Accountant.

#### RENSSELAER AND SARATOGA RAILROAD COMPANY.

HON. N. S. BENTON, Secretary of State.  
In compliance with a resolution of the Assembly, passed February 2d, 1843, the Rensselaer and Saratoga railroad company make their annual report to you as follows:

The Rensselaer and Saratoga railroad, extending from the city of Troy to the Village of Ballston Spa, is 25 miles long.

The cost of construction is..... \$475,801 10  
The receipts of the road from January 1st, 1846, to December 31st, 1846, both days included, are  
From passengers, on 18,477 through..... \$18,856 63  
" 33,920 way..... 13,510 03  
From freight..... 8,183 61  
From mail..... 524 55  
From bridge tolls..... 9,210 85  
From other sources..... 248 40

The expenditures of the company for same period are,  
For repairing and running the road..... \$38,639 48  
For expenses toll bridges..... 2,829 75  
For dividend..... 9,000 00  
The number of locomotive engines is..... 2  
" passenger cars, 8 wheels..... 2  
" " " 4 "..... 13  
" freight cars 8 "..... 2  
" " 4 "..... 11

Average number of men in the employ of the company is..... 32  
Number of miles run by engines with passenger trains..... 28,426  
Do. do. horses do..... 8,585  
Freight is taken in same train with passengers.

L. R. SARGENT, Sup't.

#### LONG ISLAND RAILROAD COMPANY.

In compliance with the 37th section of the act of incorporation, passed 24th April, 1834, and certain resolutions of the Assembly, adopted the 2d February, 1843, the Long Island railroad company submit the following report for the year ending the 31st December, 1846.

Length of road (including the Brooklyn and Jamaica road of 11 miles under lease to this company) 96 miles.

Length of Hemsted branch road, 2½ miles.  
Cost of construction..... \$1,759,502 68  
Income from thro' passengers..... 45,406 98  
" local..... 96,673 18  
" freight..... 142,080 16  
" all other sources, including ferry across Long Island sound, & other steamers..... 24,974 96  
Total receipts..... \$295,727 85

Expenses for repairs of road..... 23,336 55  
Expenses for running of the road ferry and other steamers, etc..... 338,168 29  
351,504 84  
Paid on account of construction during the 1846..... 6,455 90  
Number of through passengers..... 23,921  
" way or local do..... 165,550  
Amount of dividends..... none.  
Number of locomotives owned by company 15  
" passenger cars " 23  
" mail " 2  
" baggage " 10  
" freight " 130  
" machine and smith shops 3  
" horses " 15  
Average number of men employed by the co. 230  
Number of miles run by passenger trains..... 156,000  
" " freight " 127,000  
DAVID S. IVES, Secretary.

#### Institution of Mechanical Engineers at Birmingham.

Continued from page 423.

May 18.—Mr. J. E. McCONNELL in the Chair.

"On the use of the Fan-blast for manufacturing purposes." By Mr. BUCKLE, the following papers were read:—

1. This paper described a series of experiments on the fan-blast, as applied to manufacturing purposes. They were made for the purpose of guiding the construction of the fan, so that the greatest quantity of air could be accumulated with the least possible expenditure of power. The original application of the fan was for the purpose of separating and dressing seeds, the speed and density of the air being limited to manual power. But since their application to smitheries and foundries, steam and other motive power have been used, their speed so increased that the density of the air ranges from 3 oz. to 12 oz. per square inch. Various forms of fans have been made, but the one generally preferred is called an eccentric, with three or six blades or arms radiating from the centre. This indispensable machine is one that has abridged much time and labor; the uniform stream of air admits of no comparison with the puffing blasts of the bellows or cylinder. The smith can heat his work with precision, proportion the size of his nozzle tuyeres to suit his work, without deteriorating the intensity of the blast, and in some instances it enables him to heat one piece of work while shaping another, the pressure of the blast ranging from 4 oz. to 5 oz. per square inch, with nozzle tuyeres 1½ inch diameter; but in a well-regulated smithy, the nozzle is fitted with nose-pipes as ferrules, varying from 1 to 3 in. diameter, to suit the quantity of blast required. An eccentric fan 4 feet diameter, the blades of which are 10 inches wide by 14 inches long, and running 870 revolutions per minute, will supply air at a density of 4 oz. per square inch, to 40 tuyeres of 1½ inch diameter each, without any falling off in density. In the first six experiments no discharge of air takes place, the velocity of the fan merely keeping the air at a fixed density or pressure per square inch due to that velocity. The remaining 26 experiments show the fan discharging air. An inspection of the table will show that, under various conditions of velocity of the tips of the fan, that

density of the air, and theoretical quantity of the air discharged, varies, but not in a direct ratio. The best results are obtained when the velocity of the tips of vanes coincide with the velocity, and 9-10ths of the velocity a body would acquire by falling freely the height of a homogenous column of air due to its density. This is what we have called the theoretical velocity; or, in other words, the greatest quantity of air is discharged by the fan with the least expenditure of power when the tips of the vanes move at these velocities.

In a recent set of experiments, the inlet openings in the sides of the fan-chests were contracted to 12 inches, and 6 inches diameter—the original diameter being 17½ inches. The results obtained were, that with the 12 inch openings, the power expended was 2½ to 1 compared to the openings of 17½ inches, the velocity of fan, the density of air, and the cubic discharged being the same. With the 6 inch opening the same results followed as with the 12 inch, only the density of air decreased one quarter. These experiments show that the inlet openings must be of sufficient size, that the air may have a free and uninterrupted action in its passage to the blades; for if we at all impede this action, we do so at the expense of power. Here follows a copy of the tables of 32 experiments, after which the paper gives the dimensions of fan employed in these experiments—namely, 3 ft. 10½ in. diameter; width of the vane 10½ inches; and the length 14 inches. The fan is eccentric 17-16th inches; the vanes are five in number, and are placed at an angle of 6° to the plane of the diameter. The inlet openings on the side of the fan-chest are 17½ inches diameter. The outlet opening or discharge passage is 12 inches wide and 12 inches deep; the space between the tips of the blades and the chest increasing from two-eighths of an inch on the exit pipe, to 3½ inches at the bottom, in a perpendicular line with the centre.

Mr. Buckle said, that he had found that the area of the discharge and density of the air corresponded very nearly. His object had been to show the quantity of the air discharged at a certain density, and the power it required to effect that result.

2. Another paper on the same subject, from Mr. JONES, of the Bridgewater Foundry, Bridgewater, was also read.

Mr. JONES observes—"There is, perhaps, no point upon which mechanics have had a greater variety of opinion than that of the application of the fan for manufacturing and other purposes; nor is there any other subject which has caused more disappointment; and I am decidedly of opinion that this has been principally occasioned by constructing the air passages too small in the fans, as well as the passages leading to the tuyeres. Facts are always better than opinions; and in offering the following statement, I merely give the result of six months' constant work. Two points of importance in the construction of fans are, an exact balance of the fan upon the axle, and a careful and judicious arrangement for getting up the speed so as to avoid

either tight straps, or any slipping up on the pulleys. With this I forward you a drawing of the fans I have constructed. You will perceive that I have the openings unusually large, but the results have fully justified the proportions. With these two fans we have been melting 50 to 60 tons of iron per day, at the rate of 5 to 6 tons per hour, with a consumption of coke of 208 lb. to the ton of iron; in addition to which there are upwards of 50 smiths' fires blown at the same time. The power required is about eight horses, the motion being taken from a 12 horse power engine by means of a 7 in. gutta percha belt, the shaft running at 73 revolutions per minute: the speed of the fan is about 750. They are driven by a pulley on each end of the spindle. This I think much better than a single strap. The openings at the side of the fans are 2 ft. 4 in. in diameter, and the outlets are 24 inches by 12 inches. The passage from the fan is 2' 9" by 1' 9", leading to a reservoir under the cupola 18' 0" by 7' 0" by 4' 0" deep, from which we have two tuyeres 6 inches in diameter. The pressure of blast is about 5½ oz. per inch. The only thing to which I wish to call your attention, is the increased size of the air passages; and when we consider the large quantity of iron melted, and the small proportion of coal used, the result is very satisfactory."

Mr. BUCKLE remarked, that his paper had been drawn up for the purpose of recording a course of experiments made during a series of years at his leisure, and which had been executed with the utmost care. The results were important to those who were about to adopt the fan, as teaching them that its size must be a matter of guess-work. When he himself had a fan made, all the advice he could obtain was, "Make it big enough." The parties who said so knew nothing about it. Had he been then in possession of the results of his subsequent experiments, he should have had his fan made only half its present size. He now found that all required was, that the tips of the fan should revolve with 9-10ths of the theoretical velocity. In driving the fan at that speed they would obtain the largest portion of blast at the least expenditure of power. By driving them at a greater velocity, the power was absorbed without producing a greater quantity of blast.

Mr. COWPER wished to know if the horsepower mentioned by Mr. Jones was indicated or commercial horse-power? Was it the same as that meant by Mr. Buckle?—Mr. Buckle said, he had ascertained the power by a dynamometer, having a spiral spring and a piston attached. Having ascertained the amount indicated by the engine when disconnected with the fan, he had deducted that amount from the amount shown in every experiment. The engine was nominally a 14 horse power engine. He had found that by a succession of fans, the first transmitting the blast to the second, and so on, he obtained by the third or fourth a pressure of 2½ lbs. on the square inch.

Alderman GEACH remarked, that this plan was in use at a furnace fitted up some three

or four months since in Derbyshire, where they proved that they could obtain a pressure of 2½ lbs. on the square inch, and that they could make better iron, and in a larger quantity than by the old plan. Mr. BUCKLE had not been previously aware that the plan had been tried, but he had ascertained that uniformity of the discharge was greater than that of the blowing cylinder, and the quality of the iron would be better.

Mr. HENDERSON said, that in the works in Scotland with which he was connected, they had a fan so badly constructed that they were about to have it altered, which, nevertheless, turned out 220 to 230 tons of casting per week. They had found that they could get something like double indicated power out of the ordinary Fairbairn's engine, compared with what it was sold for. He should like to know the proper form of the fan, the proper length of pipe, and the size of the pipe which conducted the blast from the fan to the place where they wished to use it. In Scotland they were working a shaft 200 feet long; and he should like to know whether they could effect their object by laying down underground piping instead of having a shaft to conduct the power to near the place where they wished to use it. They had enlarged the tuyere pipe, having ascertained that, in melting iron, the density of the air was not so important as the quantity, and that it was necessary that the air should be admitted in large quantities.—Alderman GEACH knew of one furnace where the cupola was 150 feet from the blast.—Mr. H. SMITH stated some experiments, which went to show, as the chairman remarked, that, putting the case in an extreme point of view, the further the blast was from the fire the better. The discussion was then adjourned, to afford an opportunity for further experiments.

3. "Heated Air." The next paper was from Mr. WILKINSON, who, the Chairman observed, had been so bold as to try a totally new plan for economising fuel, by introducing heated air into the boiler of a steam-engine, among the steam, by which the inventor estimated that he effected a saving of 20 to 25 per cent. in fuel. They had had steam and heated air separately, but this was the first attempt to combine them. The following are extracts from the paper:—

"It is an unalterable law of Nature that to produce a given quantity of steam, a given quantity of heat must be imparted to the water, and that in proportion to the steam required. Therefore, under the most advantageous circumstances, to produce an effect, a certain amount of combustion must necessarily be expended. Now I find, from repeated experiments, that water alone is not the most economic agent to work with; and, by way of elucidating this fact, I will explain one, and only one, though not the most successful of my experiments, and this was made on a six horse power high pressure engine, working in a manufactory of Mr. J. Burman, Cumberland-street, Curtain road, London. The principle consists in the injection of a stream of air, heated to the high temperature of 800, into the steam in the boiler—by which

means the temperature, and consequently, the expansive force of the steam was increased. To effect this object, an iron pipe or tube was bent in a serpentine form, so as to present a great extent of surface, and placed under the boiler, there to receive a red heat from the glowing part of the fire, after it had passed the bridge on its course to the flue. One end of this rarefying chamber was connected with an injecting air-pump, proportioned to the size of the cylinder of the engine. The other end was inserted by a continuation of the tube above the surface of the water into the steam in the boiler. The whole capacity of the tube was greater than the volume of compressed air which it received from each stroke of the piston of the pump, so that the air did not enter the boiler until it had acquired the full heat or nearly so of the red hot tube through which it passed. At every stroke of the piston the same quantity of cold air was injected into the tube. That part of the air which was next to the pump was forced into a hotter place, and the air which previously occupied that hotter place, was forced on to a still hotter one, and so on, until the furthestmost and hottest of all was discharged into the steam in the boiler. The pressure of air in the tube, strictly speaking, exceeded that of the steam in the boiler, for it was an excessive pressure that overcame the resistance in the boiler. That, at the commencement of each stroke the air in the cylinder of the pump was in equilibrium with the external air, and only opposed a resistance as it became compressed, and gradually increased its compressed force until it arrived at its maximum, which was the point of equilibrium with the compressed air in the hot tube and the resistance of the steam. Taking all things into account, the whole amount of power expended in working the pump was about 5 per cent. or 120th of the force which acted on the steam cylinder of the engine, and the result of the experiment showed that the application of the heated air caused a reduction in the quantity of coal consumed of from 25 to 30 per cent, and this was continued for several weeks, the engine of course working at its usual pressure."

The CHAIRMAN had his attention called to the subject by Mr. R. Stephenson, who wished him to try it in the locomotive on the line, but he had preferred to wait till he had ascertained whether the principle was economical, and whether the results could be depended on with a stationary engine.—Mr. COWPER had seen the invention tried, and observed that the engine worked slower with than without it; but, as the inventor considered the engine out of order, he would not express any opinion upon the value of the invention.

#### AITKEN'S IMPROVEMENTS ON THE STEAM ENGINE.

Mr. J. Aitken, of Newman street, has taken out letters patent for an important improvement in the steam engine, by constructing what he terms an atmospheric cylinder placed either over the air pump, or in any other convenient situation which may be fixed.

ed upon, with the view of easing the load on the latter, which is very serious in all engines. Through this atmospheric cylinder all the condensing water passes on its way to the condenser; atmospheric pressure is thus given to the piston, and the load of the air-pump counteracted. The action of the air-pump abstracts a considerable portion of the power of every description of condensing engine during the space the load is on; but in direct action, or pumping engines particularly, where there is no fly wheel to equalize the load, the advantage of the atmospheric cylinder will be great; for steam, equal to the load of the engine, and of the air pump, must be supplied from the beginning to the end of the stroke. Supposing the air pump to be 34 inches in diameter, the pressure on the piston would be 12,700 pounds at each stroke. Mr. Aitken estimates that the use of the atmospheric cylinder will give power to that extent; and the check of the air-pump being counteracted, the engine will work more steadily, and more safely. Another advantage of this additional cylinder is, that it extracts the air from the water, on its way to the condenser, before it becomes expanded by the heat of the steam; and the lowest benefit observed from this cause, was an improved vacuum in the condenser to the extent of three-quarters of an inch of mercury. A greatly increased quantity of water may be admitted to the condenser without inconvenience to the engine, the atmospheric cylinder giving power to discharge it from the air-pump in proportion to the quantity passing through it. The principal advantages arising from the application of the new cylinder are estimated as follows—viz: 1. The steam cylinder is relieved of the load of the air pump.—2. The vacuum of the condenser is greatly improved.—3. The movement of the fly-wheel, or the momentum of a steamboat, is rendered much more steady, on account of the resistance of the air-pump at each revolution, being counteracted by the atmospheric cylinder.—4. In cases where the condensing water can be brought in a pipe from a height, the power of the engine may be increased in proportion.—5. It will obviate the difficulty sometimes experienced when the condenser is too hot to supply itself with water—and, 6. In marine engines, there will be great advantage from the supply of condensing water, being in exact proportion to the speed of the engine. The entire gain, upon the average, from the application of the new cylinder, is estimated at 22½ per cent.—*London Mining Journal.*

**BACK VOLUMES OF THE RAILROAD JOURNAL** for sale at the office, No. 105 Chestnut street.

**SPRING STEEL FOR LOCOMOTIVES,** Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1½ to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,

**PATENT RAILROAD, SHIP AND BOAT Spikes.** The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal Iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; J. Janviers, Baltimore; Degrand & Smith, Boston.

••• Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand. ja45

#### MANUFACTURE OF PATENT WIRE

Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by JOHN A. ROEBLING, Civil Engineer, Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition. 2v19 1y

#### FRENCH AND BAIRD'S PATENT SPARK ARRESTER.

**TO THOSE INTERESTED IN** Railroads, Railroad Directors and Managers are respectfully invited to examine an improved Spark-Arrester recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger & freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. M'Kee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckley & Drury, Boston, will be promptly executed. FRENCH & BAIRD.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms. Philadelphia, Pa., April 6, 1844.

••• The letters in the figures refer to the article given in the Journal of June, 1844. ja45

**PATENT HAMMERED RAILROAD, SHIP and Boat Spikes.** The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed. JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y.

The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merritt, New York; J. H. Whitney, do.; E. J. Etting, Philadelphia; Wm. E. Coffin & Co. Boston. ja45

#### MACHINE WORKS OF ROGERS,

Ketchum & Grosvenor, Patterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

##### Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR, a45 Paterson, N. J., or 60 Wall street, N. York.

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.  
Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

### THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.	
4,324 Timbers, 11 ft. long, 3 x 6 inches =	
63,696 ft. b.m., at \$10 =	\$636 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	
4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs. at 4½ cts. =	101 25
Workmanship free of patent charge	600 00

Cost of one mile including the laying of the Rail ..... \$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.  
Civil Engineer and Patentee.  
No. 277 South Tenth St., Philadelphia. 331f

### LAP-WELDED WROUGHT IRON TUBES

FOR

**TUBULAR BOILERS,**  
FROM 1 1/4 TO 6 INCHES DIAMETER,  
and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manufacture as those so extensively used in England, Scotland, France and Germany, for Locomotive, Marine and other Steam Engine Boilers.

THOMAS PROSSER,

Patentee.

1y25

28 Platt street, New York.

### RAILROAD IRON.

**MOUNT SAVAGE IRON WORKS**

THIS Company are prepared to execute orders for RAILROAD IRON, of any pattern, and equal in point of quality to any other manufactured.

Address J. M. HOWE,

Pres't. Mt. Savage Iron Works,  
Dec. 25, 1y\* Maryland.

ENGINEERS' AND SURVEYERS'

**INSTRUMENTS MADE BY**

**EDMUND DRAPER,**

Surviving partner of  
**STANCLIFFE & DRAPER.**

**PIG AND BLOOM IRON.**—THE SUBSCRIBERS are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by

A. WRIGHT & NEPHEW,

Vine St. Wharf, Philadelphia.

**RAILROAD IRON.**—THE "MONTGOMERY" Iron Company, Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to

1y48

MURDOCK, LEAVITT & CO.,  
Agents.  
77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC** Cement. This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floods and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper-barrels, by JOHN W. LAWRENCE,

142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 32 1y

# RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

## ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—

for sale or imported to order by the subscriber. These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,  
75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.		Weight per fathom.	Diameter of iron.	
	INCH.	LBS. OZ.	INCH.	LBS. OZ.		LBS.	INCH.	Tons.
11	4	13 5	10	24 -		50	15-16	20
13	3½	8 3	8½	16 -		27	11-16	13½
14	3	6 11	7½	12 8		17	9-16	10½
15	2½	5 2	6½	9 4		13½	1-2	7½
16	2	4 3	6	8 8		10½	7-16	7

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1y24

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLICOTT & ABBOTT.  
Factory, 9th street, near Coates, cor. Melon st.  
Office, No. 3 North 5th street,  
Philadelphia, Pa.

1y25

## THE SUBSCRIBERS, AGENTS FOR

the sale of  
Codorus,  
Glendon,  
Spring M.I. and  
Valley,  
Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

SAML. KIMBER, & CO.,  
59 North Wharves,  
Jan. 14, 1846. [1y4] Philadelphia, Pa.

## RAILWAY IRON.—THE BEST QUALITY

of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by

DAVIS, BROOKS & CO.,  
Jan. 2. [11c] 68 Broad St., New York.

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,] WILLIAM ROE, Supt of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed,] G. A. NICOLL,

Supt. Transportation, etc., Philadelphia and Reading Railroad. To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,] T. L. SMITH,

Jersey City, November 4, 1845. N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed,] JOHN LEACH,

Jamaica November 12, 1845.

1y19 Supt Motive Power

## NICOLL'S PATENT SAFETY SWITCH

for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee  
G. A. NICOLLS,  
Reading, Pa.

## TO RAILROAD COMPANIES AND MANUFACTURERS OF RAILROAD MACHINERY.

The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

THOMAS & EDMUND GEORGE,  
a45 N. E. cor. 12th and Market sts., Philad., Pa.

## RAILROAD IRON.—THE NEW JERSEY

Iron Company, Boonton, N. J., are now making Railroad Bars, and are prepared to execute orders for any required pattern. Apply to

FULLER & BROWN, Agents,  
No. 139 Greenwich, corner of Cedar street.  
June 1, 1847. 10c

## RAILWAY IRON.—DAVIS, BROOKS

& Co., No. 68 Broad Street, have now in port on Ship-board, 200 Tons of the best English heavy H Rails, 60 lbs. to the lineal yard, which they offer for sale on favorable terms, also, about 6 to 700 Tons now on the way, to arrive shortly, of the same description of Rail. 46c

## NORRIS' LOCOMOTIVE WORKS.

BUSH HILL, PHILADELPHIA, Pennsylvania.

**M**ANUFACTURE their Patent 6 Wheel Combined and 8 Wheel Locomotives of the following descriptions, viz:

Class	1,	15 inches Diameter of Cylinder,	× 20 inches Stroke.
"	2,	14	" " " × 24 " "
"	3,	14½	" " " × 20 " "
"	4,	12½	" " " × 20 " "
"	5,	11½	" " " × 20 " "
"	6,	10½	" " " × 18 " "

With Wheels of any dimensions, with their Patent Arrangement for Variable Expansion. Castings of all kinds made to order; and they call attention to their Chilled Wheels, for the Trucks of Locomotives, Tenders and Cars.

NORRIS, BROTHERS.

**K**EARNEY FIRE BRICK. F. W. BRINLEY, Manufacturer, Perth Amboy, N. J. Guaranteed equal to any, either domestic or foreign. Any shape or size made to order. Terms, 4 mos. from delivery of brick on board. Refer to

 Gardiner, Harrison & Co. Newark, N. J.  
 25,000 to 30,000 made weekly.

**T**HE NEWCASTLE MANUFACTURING Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention. **ANDREW C. GRAY,** President of the Newcastle Manuf. Co.

**R**AILROAD IRON AND LOCOMOTIVE Tyres imported to order and constantly on hand by **A. & G. RALSTON** Mar. 20th 4 South Front St., Philadelphia.

**V**ALUABLE PROPERTY ON THE MILL Dam For Sale. A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 68,497 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x32 ft. with lathes, work benches, Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, turnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45½ feet two stories high, with a shed part 45½x20 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 200 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to **HENRY ANDREWS**, 48 State st., or to **CURTIS, LEAVENS & CO.**, 106 State st., Boston, or to **A. & G. RALSTON & Co.**, Philadelphia. ja45

**T**O RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.

PASCAL IRON WORKS.

WELDED WROUGHT IRON TUBES

From 4 inches to 1 in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T, L, and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by

**MORRIS, TASKER & MORRIS.**  
 Warehouse S. E. Corner of Third & Walnut Streets,  
 PHILADELPHIA.

**T**O LOCOMOTIVE AND MARINE ENGINE Boiler Builders. Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

**MORRIS TASKER & MORRIS,**  
 Warehouse S. E. corner 3d and Walnut Sts., Philadelphia. 11f

**P**ATENT INDESTRUCTIBLE WATER

Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York.

J. BALL &amp; CO.

**THE SUBSCRIBER IS PREPARED TO** execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip.  
1st 10 New York.

**LOCOMOTIVE AND CAR AXLES.**  
The Subscribers are now prepared to receive orders for the well known and approved *Reading Locomotive and Car Axles*—drawn to any required pattern from *Bloom Iron only*. Address

SAML KIMBER & CO.,  
Willow Street Wharf,  
4th Philadelphia, Pa.

**THE SUBSCRIBERS ARE PREPARED TO** execute orders at their Phoenix Works for Railroad Iron of any required pattern, equal in quality and finish to the best imported.

REEVES, BUCK & CO.,  
Philadelphia.  
ROBERT NICHOLS, Agent,  
26th No. 79 Water St., New York.

**NOTICE TO CONTRACTORS.—SEALED** Proposals will be received until Wednesday, July 15th, in the Borough of Harrisburg, and until Wednesday, July 22d, in the city of Pittsburg, at 10 o'clock A.M., at the Office of the Engineers, for the Grading and Masonry upon fifteen miles of the Pennsylvania Railroad, extending west from Harrisburg, and fifteen miles of said Railroad, extending east from Pittsburg. The grading will include very heavy work, and the amount of Masonry, including the Piers of Abutments of the Bridges across the Susquehanna, three-quarters of a mile in length, will be unusually large. Plans and specifications of the work can be seen at the Engineer's office in each place, for ten days previous to the time appointed for receiving the bids. Any further information can be had upon application to the Chief or Associate Engineers. S. V. MERRICK, President.

**MICHIGAN CENTRAL RAILROAD.—NOTICE TO CONTRACTORS.**—Proposals will be received by the Subscriber until the 1st of August next, for the Grading of that portion of the Michigan Central Railroad lying between Antwerp and New Buffalo, a distance of 60 miles.

Profiles and specifications will be ready for examination after the 15th day of July next, at the office of the subscriber, or that of Col. J. M. Berrien, at Kalamazoo, at which time the line will be shown to contractors. J. W. BROOKS, Supt.

Michigan Central Railroad Office,  
62d Detroit, June 17, 1847.

**CONCORD RAILROAD.—PASSENGER** Trains in connection with the Lowell & Nashua Railroads, run daily between Concord and Boston, Sundays excepted, as follows, viz:

Leave Concord at 5 40 and 11 5 a.m. and 3 15 p.m.  
Leave Boston at 7 and 11 a.m. and 5 p.m.

This road runs by Nashua and Manchester to Concord N. H., where it connects with the Northern railroad, extending from Concord to the mouth of White river in Vermont, 18 miles of which road, to Franklin, is now opened, and the remainder is rapidly completing.

It is the direct route to Central and northern New Hampshire, and to Montpelier, Burlington, and other towns in northern Vermont, and has a greater proportion of railroad conveyance in those directions than any other line.

It is also the British Steam Mail Line, and the nearest route from Boston to the Canadas. Numerous stages connect with all parts of the road.

For further information, apply at B. P. Cheney & Co.'s Express office, No. 8 Court St., and Averill & Dean, No. 15 Elm St.

All passengers' baggage should be properly marked, and when valued at more than \$50, notice must be given, and extra charges paid, or no loss beyond such amount will be allowed.

26th N. G. UPHAM, Supt.

**NEW YORK AND ERIE RAILROAD LINE**  
SUMMER ARRANGEMENT. For passengers, twice each way daily,

(except Sunday,) leave New York from the foot of Duane St. at 7 o'clock, A. M. and at 4 o'clock, P. M. by steamboat, for Piermont, thence by cars to Ramapo, Monroe, Chester, Goshen, Middletown, Otisville, and the intermediate stations.

The return trains for New York will leave Otisville at 6 30, A. M. and 4 15, P. M.; Middletown at 7 A. M. and 4 40, P. M.; Goshen at 7 22, A. M. and 5 3, P. M.; Chester at 7 35, A. M. and 5 18, P. M.

Fare between New York and Otisville, \$1 50; way-fare in proportion.

For MILK—Leave Otisville at 5 1/2 o'clock, morning and evening.

For FREIGHT—The barges "Samuel Marsh and "Henry Suydam, Jr." will leave New York (from the foot of Duane St.) at 5 o'clock, P. M. daily (except Sundays.)

No freight will be received in New York after 5 o'clock, P. M.

Freight for New York will be taken by the trains leaving Otisville at 10 1/2 o'clock, A. M.; Middletown at 11, A. M.; Goshen at 12 1/2, P. M.; Chester at 1 o'clock, P. M., etc., etc.

For further particulars, apply to J. F. CLARKSON, Agent, corner of Duane and West Sts., New York, or to S. S. POST, Superintendent Transportation, Piermont.

24th H. C. SEYMOUR, Sup't.

**WESTERN RAILROAD.—ON AND AFTER** Monday, April 5, 1847, the passenger trains will leave daily, Sundays excepted, as follows:

Boston at 8 a. m. and 4 p. m. for Albany.  
Albany at 7 1-4 a. m. and 5 p. m. for Boston.  
Springfield at 8 1-2 a. m. and 1 p. m. for Albany.  
Springfield at 8 1-2 a. m. and 1 1-2 and 3 p. m. (or on arrival of the train from New York) for Boston.

Day line to New York, via Springfield.—The steamboat train leaves Boston at 6 a. m., and arrives in New York at 7 p. m., by the steamboats Traveler, New York, or Champion. Returning, leaves New York at 6 1-4 a. m., and arrives in Boston at 7 p. m.

Night line to New York.—Leaves Boston at 4 p. m., and arrives in New York at 5 a. m.

Albany and Troy.—Leave Boston at 8 a. m., Springfield at 1 p. m., and arrive in Albany at 6 p. m.; or, leave Boston at 4 p. m., Springfield next morning at 8 1-2, and arrive in Albany at 1 1-2 p. m.

The Troy trains connect at Greenbush.

The trains for Buffalo leave at 7 1/2 a. m. and 7 p. m. For Northampton, Greenfield, etc.—The trains of the Connecticut River Railroad leave Springfield at 9 1-4 a. m., 1 and 3 p. m., and passengers proceed directly on to Brattleboro', Windsor, Bellows Falls, Walpole, Hanover, Haverhill, etc.

For Hartford.—The trains leave Springfield on the arrival of the trains from Boston.

The trains of Pittsfield and North Adams Railroad leave Pittsfield on the arrival of the trains from Boston.

N. B.—No responsibility assumed for any baggage by the passenger trains, except for wearing apparel not exceeding the value of fifty dollars, unless by special agreement.

JAMES BARNES, Sup't and Eng'r.  
C. A. SEAD, Agent, 27 State street, Boston.

**BOSTON AND PROVIDENCE RAILROAD.** Passenger Notice. Summer Arrangement. On and after Monday, April 5, 1847, the Passenger Trains will run as follows:

Steamboat train via Stonington.—Leaves Boston every day, except Sunday, at 5 o'clock p. m.

Accommodation Trains—leave Boston at 7 and 10 1/2 a. m. and 4 p. m., and Providence at 7 1/2 and 10 1/2 a. m. and 4 p. m.

Dedham trains, leave Boston at 8 a. m., 12 1/2, 3 1/2, 6 1/2 and 9 p. m., Leave Dedham at 7 and 9 1/2 a. m. and 2 1/2, 5 1/2 and 8 p. m.

Stoughton trains, leave Boston at 11 1/2 a. m. and 5 1/2 p. m. Leave Stoughton at 7 10 a. m. and 3 1/2 p. m.

All baggage at the risk of the owners thereof.

25th W. RAYMOND LEE, Sup't.

**NEW YORK & HARLEM RAILROAD**  
CO.—Summer Arrangement.—On and after Tuesday, June 1st, 1847, the cars

will run as follows, until further notice. Up trains will leave the City Hall for—Yorkville, Harlem and Morrisana at 6, 8 and 11 a. m., 2, 2 30, 5 and 7 p. m.

For Morrisiana, Fordham, Williams' Bridge, Tuckahoe, Hart's Corner and White Plains, 7 and 10 a. m., 4 and 5 30 p. m.

For White Plains, Pleasantville, Newcastle, Mechanicsville and Croton Falls, 7 a. m. and 4 p. m.—Freight train at 1 p. m.

Returning to New York, will leave—Morrisiana and Harlem, 7, 8 20 and 9 a. m., 1, 3, 4 30, 6, 6 28 and 8 p. m.

Fordham, 8 08 and 9 15 a. m., 1 20 and 6 15 p. m.

Williams Bridge, 8 and 9 08 a. m., 1 10, 6 08 p. m.

Tuckahoe, 7 38 and 8 25 a. m., 12 55 and 5 52 p. m.

White Plains, 7 10 and 8 35 a. m., 12 50, 5 35 p. m.

Pleasantville, 8 15 a. m. and 5 15 p. m.

Newcastle, 8 a. m. and 5 p. m.

Mechanicsville, 7 48 a. m. and 4 48 p. m.

Croton Falls, 7 30 a. m. and 4 30 p. m. Freight train at 10 a. m.

Freight train will leave 32d street for Croton Falls and intermediate places, 4 a. m. and City Hall 1 p. m.

Returning, leave Croton Falls 10 a. m. and 9 1/2 p. m.

ON SUNDAYS, the trains will run as follows: Leave City Hall for Croton Falls, 7 a. m., 4 p. m.

Croton Falls for City Hall, 7 30 a. m., 4 30 p. m.

Leave City Hall for White Plains and intermediate places, 7 and 10 a. m. and 5 30 p. m.

White Plains for City Hall, 7 10 and 8 35 a. m., 12 30 and 5 35 p. m.

Extra trains will be run to Harlem, Fordham and Williams Bridge on Sunday, when the weather is fine.

The trains to and from Croton Falls will not stop on N. York island, except at Broome st. and 32d st.

A car will precede each train 10 minutes to take up passengers in the city.

Fare from New York to Croton Falls and Somers \$1, to Mechanicsville 87c., to Newcastle 75c., to Pleasantville 62c., to White Plains 50c.

25th

**LONG ISLAND RAILROAD COMPANY.** Summer Arrangement. On and after Monday May 1st, trains will run as follows, except Sundays:

Leave—Brooklyn at 9 1-2 a. m. for Farmingdale, 1 1-2 p. m. for Greenport, at 4 p. m. for Farmingdale.

Leave Farmingdale at 7 a. m. for Brooklyn, 12 m. do., at 3 1-4 do. do.

Leave Greenport at 8 1-2 a. m. for Brooklyn.

Leave Jamaica at 8 a. m. for Brooklyn, at 1 p. m. do., at 4 1/2 p. m. do.

On Saturdays, a train will leave Brooklyn for Yaphank, at 4 p. m. Leave Yaphank, on Mondays for Brooklyn at 5 1-2 a. m.

On and after May 15th, and until September 1st, 1847, a train will leave Jamaica at 7 a. m. for Brooklyn—leave Brooklyn at 6 p. m. for Jamaica, and will land and receive passengers at any place between Brooklyn and Jamaica.

On Sundays—leave Brooklyn at 8 1-2 a. m. for Farmingdale; leave Farmingdale at 4 p. m. for Brooklyn.

Freight Trains—leave Brooklyn at 10 a. m. for Greenport; leave Greenport at 12 m. for Brooklyn.

Baggage crates will be in readiness at the foot of Whitehall street, to receive baggage for the several trains, 30 minutes before the hour of starting from the Brooklyn side.

The steamer "Statesman," Captain Nash, leaves Greenport for Sag Harbor on the arrival of the Accommodation train from Brooklyn.

25th DAVID S. IVES, Sup't.

**PATERSON RAILROAD** Summer Arrangement. Commencing April 20th, 1847, the cars will leave

PaterSON at New York at

8 o'clock a. m. 9 1/2 o'clock a. m.

11 1/2 o'clock a. m. 12 1-4 o'clock p. m.

4 o'clock p. m. 5 1/2 o'clock p. m.

On Sunday, 8 o'clock a. m. 9 1/2 o'clock a. m.

4 o'clock p. m. 5 1/2 o'clock p. m.  
Office 75 Courtland St.

**BALTIMORE AND SUSQUEHANNA**

Railroad.—Reduction of Fare. Morning and Afternoon Trains between Baltimore and York.—The Passenger

trains run daily, except Sunday, as follows:  
Leaves Baltimore at.....9 a.m. and 3½ p.m.  
Arrives at.....9 a.m. and 6½ p.m.  
Leaves York at.....5 a.m. and 3 p.m.  
Arrives at.....12½ p.m. and 8 p.m.  
Leaves York for Columbia at.....1½ p.m. and 8 a.m.

Passenger Depot in Philadelphia corner of Broad and Vine streets. 8½

**PHILADELPHIA, WILMINGTON & BALTIMORE RAILROAD.—1847.**

Summer Arrangement.

Philadelphia for Baltimore... 8 a.m. and 10 p.m.  
Baltimore for Philadelphia... 9 a.m. and 8 p.m.  
Connecting with Mail Lines North, South & West.

On Sundays, only the 10 P. M. Lines run.

The Boat Lines, via Newcastle & Frenchtown R.R. Leave Philadelphia at 3½ p.m. No line on Sunday. Leave Baltimore at 3 p.m. day.

Accommodation Trains between Philadelphia & Wilmington.—Philadelphia to Wilmington, 8 a.m., mail, 12½ p.m., 4 p.m., 7 p.m., 10 p.m. mail. Wilmington to Philadelphia, 7 a.m., 1 p.m., mail, 4½ p.m., 7 p.m., 12½ a.m., night mail.

J. R. TRIMBLE, Engineer and General Superintendent.

**CONNECTION BETWEEN THE BOSTON AND LOWELL AND THE BOSTON AND MAINE RAILROADS.**

On and after April 1st, 1847, passenger trains between these two roads, will run as follows, viz:

Leaving Lowell at 7, 11 1-4 a.m., and 2 1-2, 4 1-2, and 6 1-2 p.m., to connect at the junction in Wilmington with the eastward trains—at 7 a.m. and 2 1-2 p.m. with those to Portland; at 4 1-2 p.m. to Great Falls only, with a detention of 45 minutes at the junction, and at 11 1-4 a.m. and 6 1-2 p.m. to Haverhill only. Leaving the junction in Wilmington, for Lowell, at about 7 1-4 a.m. on arrival of the morning train from Haverhill; at about 9 a.m., on arrival of the morning trains from Great Falls. At about 11 3-4 a.m., on arrival of the morning train from Portland. At about 5 p.m. on arrival of the afternoon trains from Haverhill. At about 7 1-4 p.m. on arrival of the afternoon train from Portland. WALDO HIGGINSON, Agent.

**NEW YORK AND PHILADELPHIA RAILROAD line—direct.**

Via Newark, New Brunswick, Princeton, Trenton, and Bristol. (Through in six hours.) Leaving New York daily from the foot of Liberty street.

Morning line.....9 o'clock a.m.  
Mail pilot line.....4 " p.m.

The lines proceed direct to Bristol without change of cars, and thence by the new steamer, "John Stevens," to Philadelphia.

**FARE BETWEEN NEW YORK & PHILA.**

First class cars.....\$4 00  
Second class cars.....3 00

Passengers will procure their Tickets at the office foot of Liberty st., where a commodious steamboat will be in readiness with Baggage-crates on board.

Fifty pounds of baggage will be allowed to each passenger in this line, and passengers are expressly prohibited from taking anything as baggage but their wearing apparel, which will be at the risk of the owner.

Philadelphia Baggage-crates are conveyed from city to city, without being opened by the way. Each train is provided with a car, in which are apartments and dressing rooms expressly for ladies' use.

Returning, the lines leave Philadelphia from the foot of Walnut st. at 9 a.m. and 4 1-2 p.m.

The lines for Baltimore leave Philadelphia daily, except Sundays, at 8 a.m., 3½ and 10 p.m., and Sundays only at 10 p.m.—being a continuation of the line from New York. 25½

**LITTLE MIAMI RAILROAD.—OPEN TO SPRINGFIELD.—Distance 84 miles—**

connecting at Xenia and Springfield with Messrs. Neil, Moore, & Co's. daily daylight lines of stages going east and north, to Columbus, Zanesville, Wheeling, Cleveland, and Sandusky City, via Urbana, Bellefontaine, Kenton, and the Mad river and lake Erie railroad, or Columbus, Delaware, and the Mansfield and Sandusky City railroad—forming, by these connections, the cheapest and most expeditious route to Buffalo, Niagara Falls, Rochester, Albany, New York, and Boston.

On and after Thursday, August 13, 1846, until further notice, a Passenger train will run as follows:

Leave Cincinnati daily at 9 A. M., for Milford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Old Town, Yellow Springs, and Springfield.

Returning, will leave Springfield at 4 hours 35 minutes A. M. A line of Hacks runs in connection with the Cars, between Deerfield and Lebanon.

FARE—From Cincinnati to Lebanon....\$1 00  
" " " Xenia.....1 50  
" " " Springfield... 2 00  
" " " Columbus... 4 00  
" " " Sandusky city 8 00

The Passenger trains run in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at of a passage for every \$500 in value over that amount.

The 1½ P. M. train from Cincinnati, and the 2 40 P. M. train from Xenia, will be discontinued on and after Monday, the 10th instant.

A freight train will run daily.  
47½ W. H. CLEMENT, Sup't.

**BALTIMORE AND OHIO RAILROAD.**

MAIN STEM. The Train carrying the

Great Western Mail leaves Baltimore every morning at 7½ and

Cumberland at 8 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburgh and Hancock, connecting daily each way with the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Pittsburgh. Time of arrival at both Cumberland and Baltimore 5½ P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pittsburgh \$10, and time about 39 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$12. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

**WASHINGTON BRANCH.**

Daily trains at 9 A. M. and 5 P. M. and 12½ at night from Baltimore and at 6 A. M. and 5½ P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. 35½

**LEXINGTON AND OHIO RAILROAD.**

Trains leave Lexington for Frankfort daily,

at 5 o'clock a.m., and 2 p.m.

Trains leave Frankfort for Lexington daily, at 8 o'clock a.m. and 2 p.m. Distance, 28 miles. Fare \$1 25.

On Sunday but one train, 5 o'clock a.m. from Lexington, and 2 o'clock p.m. from Frankfort.

The winter arrangement (after 15th September to 15th March) is 6 o'clock a.m. from Lexington, and ma. 9. from Frankfort, other hours as above. 35½

## AMERICAN RAILROAD JOURNAL.

PUBLISHED AT 105 CHESTNUT ST. PHILADELPHIA.

Saturday, July 17, 1847.

We desire to express our thanks to those friends who have remembered that a Journal like ours—devoted mainly to a particular interest, and of a comparatively limited circulation—requires prompt payment of its subscriptions to meet its necessary expenses; and also to those who so promptly responded to our recent call; but we are under the necessity of again requesting those subscribers at a distance—with whom we can only communicate by letter, or through the Journal—to remit the amount of subscription by mail—at our risk—as early as convenient, and thus enable us to keep the wheels in motion.

### The Rappahannock Canal.

We find, in the Fredericksburg News, the following notice of "the Rappahannock canal"—which we suppose means a canal around the falls on the Rappahannock above Fredericksburg—and we are pleased to learn that another obstruction to the navigation of our rivers is to be removed. Small means, judiciously laid out, will often accomplish great good to the agricultural community; such we hope will be the case in this instance. The editor says: "This improvement, which we believe is destined to work untold benefits to our town, is now progressing towards its completion as fast, as under the circumstances, we could expect. We visited a few days ago, the lower section, and was delighted with that portion of the work which had been partially finished. The first lock, at or near Minor's dam, is the most beautiful and durable specimen we have ever seen of that kind of workmanship. Indeed the canal, so far as we are qualified to judge, is well executed, and gives assurance that the floods may come and the rains beat against it, and it will

long stand a monument to the wisdom and foresight of its projector. In a conversation with its experienced and talented engineer, we are pleased to learn that the probability is, the work will be finished by the 1st of October; thereby affording the farmer in the upper country, facilities for bringing his wheat crop to market the ensuing fall and winter."

### Receipts on the Central and Pontiac Railroads.

The following receipts of principal articles over the Central and Pontiac Railroads during the month of June, are furnished by the Detroit Advertiser:

#### Central Railroad.

Flour.....bbls.	4,242	Whiskey.....bbls.	25,692
Wheat.....bush.	10,664		
Wool.....lbs.	117,807		

#### Detroit and Pontiac Railroad.

Flour.....bbls.	4,242	Whiskey.....bbls.	79
Ashes.....cks.	184	Seeds.....cks.	6
Oats and corn..bu.	531	Bran and meal,cwt	7,600
Hides and skins,"	250	Saleratus.....lbs.	9,429

### Commerce of Milwaukee.

The arrivals and clearances at the port of Milwaukee, from April 12th to July 1st, 1847, and the number of barrels bulk of passenger's goods, and number of tons of merchandise landed were:

Steamboats, propellers, brigs, and schrs.....	343
Number of passengers.....	10,890
Number of bbls. bulk of passenger's goods.....	21,476
Number of tons merchandise.....	2,786

### Railway to China.

We find in the Railway Record, of June 5th, a suggestion for a railway through Europe to China. It says that "Mr. S. B. Rodgers, of Nantyglo, has published a pamphlet on the practicability of constructing 10,000 miles of railway through Europe and Asia, and thus connecting London and Paris with Canton and our East India possessions, and all the great cities and provinces on its route. The route proposed is by Paris, Munich, Vienna, Belgrade, and Constantinople; thence through Syria, Persia, Beeloochistan, and Scinde, to Oodipoor, Calcutta, through the Berman empire, and the north part of Cochin China, to Canton."

This beats Mr. Whitney's project of a railroad to Oregon, by many thousand miles.

### Splendid Car.

The Baltimore and Susquehanna railroad company, have, we understand, just placed a new passenger car on the road, of a very splendid description. The body is of a dark claret color, highly finished, and the interior is splendidly furnished with curtains of crimson cut velvet. This car has been

manufactured entirely at the shops of the company, under the management of Mr. Millbolland.

### A Locomotive Astray.

The Springfield Gazette says that the engine designed for the passenger train from Greenfield to Springfield, on Saturday morning, having been "fired up" as usual, started off alone in consequence of some defect, while the engineer was getting his breakfast, and ran with considerable speed to South Deerfield, a distance of eleven miles, and stopped, the steam having been exhausted. The engineer started to overtake it at first on foot, but being soon distanced, procured a horse, and drove down to S. Deerfield, fired up again, and came through with the train to Springfield—40 miles—in 70 minutes, including all stops, save one at Northampton.

So much for leaving a horse in the street, without being made fast.

### Railway Stations.

In England, railway stations cost something, according to the Liverpool Journal, which says that "Mr. Brassey has taken the contract for the Chester station at £90,000."

As soon as the Newcastle and Berwick railway is opened, the whole distance between Edinburgh and London, by express trains will, says the Newcastle Journal, be accomplished in thirteen hours.

### Chesapeake and Ohio Canal.

The stockholders of the Chesapeake and Ohio canal company, at a general meeting, held at the Exchange Hotel, Baltimore, recently, selected the following gentlemen for the management of the affairs of the company for the ensuing year.

President.—Col. James M. Coale.

Directors.—Dr. S. P. Smith, of Allegany county; Geo. Schley, of Washington county; W. C. Johnson, of Frederick county; J. Pickell, of Baltimore city; W. A. Bradley, Washington, D. C.; Henry Dangerfield, Alexandria, Va.

The earnings of the Harlem railroad have been for the first 14 days of July.....\$14,261  
Same time last year.....9,687

Increase.....4,574

The New Jersey railroad company have declared a dividend of 3½ per cent.; the Delaware and Raritan canal and Camden and Amboy railroad co. a semi-annual dividend of 6 per ct.; the Philadelphia and Trenton railroad co. 3 per ct for 6 months.

The Auburn and Rochester railroad company, for the purpose of providing means with which to relay their track with the heavy iron rail, have concluded to increase their capital stock.

**Connecticut & Passumpsic Rivers Railroad.**

We have received a pamphlet containing the following in relation to this railroad—and as little, comparatively, is known at the south and west in relation to the resources of this part of Vermont, we give it a place in the Journal.

Incorporated by the Legislature of the State of Vermont—authorized to construct a railroad from the mouth of White river in Hartford, Vt., (opposite the town of Lebanon, N. H.) following the valley of the Connecticut and Passumpsic rivers to the North Line of the State at Derby.

At the mouth of White river it forms a junction with the Northern and Vermont Central railroads.

**THE ROUTE**

Of the Connecticut and Passumpsic Rivers railroad for 75 or 80 miles from the mouth of White river, as will be seen by the accompanying map, is more direct than that of any other railroad of equal length in the northern or middle States. Thence north, between the town of Burke and the line of the State at Derby, three different routes have been proposed, only one of which has been surveyed. The results are favorable as shown by the map. An examination of the other proposed routes may result in a reduction of grades and an essential diminution of distance.

The valley of the Connecticut and Passumpsic rivers, north of White river, forms the natural business centre, and the outlet of one of the best agricultural districts in New England, abounding also with available water power to any desirable extent. *More than twenty business villages*, many of them of considerable importance, are located upon the immediate line of the road within the first 75 miles.

The first 40 miles, between the mouth of White river and the village of Wells river is under contract, and will be completed early in the fall of 1848. The maximum grade upon these 40 miles is 26.4 feet per mile.

This division of the road being in the most wealthy and populous portion of Connecticut river, north of Greenfield, Mass., and reaching at Wells river a central point for a widely extended district, must prove immediately productive, and will ensure the extension of the road beyond. Indeed the local business upon the line as far as St. Johnsbury, twenty miles north of Wells river, is sufficient to ensure ample profits upon the investment, irrespective of the connection with the Canadian road.

The northern portion of the route passes through an equally productive country to Canada line, where it will connect with the St. Lawrence and Atlantic railroad, leading thence to Montreal.

**THE CHARTER.**

The act of incorporation is liberal and ample. The capital may be increased to \$3,000,000. The rates of toll may be established by the directors—"Provided, however, that the supreme court on an application, etc. may alter or establish the rates of toll for a term not exceeding ten years at any one time, and in such a manner that said corporation

shall not receive less than twelve per centum per annum."

**\* AGRICULTURAL PRODUCTIONS.**

The following table of agricultural products is taken from the United States census of 1840. It embraces the counties of Caledonia and Orleans in Vermont, and—for the purpose of instituting a comparison—the county of Worcester in Massachusetts. Worcester county has been selected as being very generally known, and ranking high as an agricultural district.

	Caledonia county, Vermont.	Orleans county, Vermont.	Worcester county, Mass.	Average valuation.
No. of Towns...	17	20	55	.....
Population....	21,891	13,634	95,313	.....
No. of horses...	5,852	3,462	10,657	\$75 00
No. of cattle....	32,668	18,299	67,667	15 00
No. of sheep....	100,886	46,669	26,128	1 50
No. of swine....	18,991	9,750	26,272	7 00
Bushels of wheat	52,109	33,315	45,759	1 25
Bushels of oats...	342,433	133,301	375,471	35
Bushels of rye...	1,799	2,400	84,914	75
Bushels of corn...	52,350	20,186	372,591	75
Bush. of potatoes	1,066,848	569,855	1,146,092	20
Pounds of wool...	183,198	107,580	70,059	35
Pounds of sugar...	665,397	507,446	00	7
Products of dairy	\$215,377	\$104,606	\$511,073	.....
Tons of hay....	67,077	37,291	124,737	10 00

The value of these products varies in the different counties, but for the purpose of instituting a comparison, an average valuation has been assumed—and at the prices indicated, the county of Caledonia, with a population of 21,891, and an area of 700 square miles, exhibits in the aggregate a valuation of \$2,045,306—equal to \$93.43 for each inhabitant.

And the county of Worcester, with a population of 95,313, and an area of 1500 square miles, a valuation of \$3,458,919—equal to \$36.30 for each inhabitant.

It is admitted that the proportion of the whole population engaged in agricultural pursuits is less in Worcester than in Caledonia county, but in proportion to the amount produced, the number thus employed is obviously much greater.

Again—while in Worcester county the agricultural resources are pretty fully developed and no considerable increase can be expected in the articles enumerated—in Caledonia co. probably less than one-third of the arable land is yet cultivated, and no doubt, with a railroad communication to the markets, the time will soon arrive when these articles of produce will be fourfolded.

Indeed, the increase has already been very considerable since 1840, and the capabilities of the county with its present population are adequate to a still greater increase, if the means for transportation to market were such as to encourage the production of a surplus.

These remarks have been confined to Caledonia county for the sake of the comparison with a well known district in Massachusetts, but they are equally applicable to the whole region traversed by the Connecticut and Passumpsic Rivers railroad.

**MINERALS.**

Iron ore is found at several places along the line of the route, both in Vermont and New Hampshire. "In Piermont occurs an important bed of micaceous specular iron ore,

which was examined with great care. The beds of ore vary in thickness, from a few inches to three or four feet. An analysis shows the following result. In 100 grains

Per oxide of iron.....	93.5 grains.
Titanic acid.....	3.8 "
Silica.....	2.7 "
	100.0

Equal to 64.8 per cent. of pure metallic iron."

**—Dr. Jackson's Geological Report.**

The Franconia iron works, twenty miles from Wells river are well known.

At Troy, Vt., occurs an extensive vein of magnetic iron ore. "It is," says Mr. Adams in his geological report, "a nearly perpendicular vein which conforms in direction to the general direction of the serpentine range, and has been traced with more or less interruption for the distance of two miles. It is from three to five feet wide, and does not appear to be in danger of being exhausted in the direction of its length or depth.

In 1844, 600 tons of pig iron and castings were made at the Troy furnace, and machinery has since been erected for the manufacture of wrought iron.

Analysis—Peroxide of iron.....	81.20
Protoxide of iron.....	13.37
Titanic acid.....	4.10
Silica.....	1.33
	100.00

Metallic iron.....66.62."

**Lime Stone** and shell marl are common in most of the towns on the Vermont side of Connecticut river, and extensive quarries of lime stone exist in Haverhill, Lisbon, Orford, Lyme and other towns on the New Hampshire side of the river. According to Dr. Jackson, the lime manufactured at Haverhill compares favorably with the Thomaston lime. An analysis of the rock shows 55.729 per cent. of pure lime.

**Free Stone.** "Two miles north of Oxford," says Dr. Jackson, "occurs an immense bed of compact talcose slate, which answers perfectly for soap stone, and is quarried to some extent, but may by proper management be made to furnish an almost unlimited quantity of that valuable material."

**Copperas.** In the town of Strafford, Vt., some 2000 tons of copperas have been manufactured per annum and sent to the Boston market. The quantity is to be increased the present year to 4000 tons, and the ore is inexhaustible.

**Roofing Slate** of good quality is found in the town of Thetford, Vt., near the line of the railroad.

**STATISTICS OF FREIGHT.**

Nearly accurate statistics of freight to and from market in the towns which will be tributary to the Passumpsic railroad have been obtained. These towns embrace the counties of Caledonia, Orleans, Essex, and half the county of Orange in Vermont, and the towns bordering upon Connecticut river in the counties of Grafton and Coos, N. H.

These freights, it should be noticed, have occurred while the average distance of transportation by teams was 80 to 100 miles.

A glance at the map will show that the amounts of freight in the different sections

embraced have not been in proportion to the population, nor do they indicate the relative productiveness of the soil. But they are in proportion to the relative proximity of the towns to railroad or water communication.

According to well established data, the amount of freights and travel upon any thoroughfare will be immediately quadrupled upon extending to it railroad facilities.

While therefore this result may be confidently expected in the present case, the prospective increase of business after the completion of the railroad must be rapid and almost unlimited, in view of the capacity of the country for agricultural productions and the immense water power along the line

	Valuation in 1846.	Population in 1840.	Tons of freight.
Nine towns in Orange county and one [Nor- wich] in Windsorco.	702,694 67	16,650	9,947
Caledonia county.....	830,982 83	21,891	10,047
Orleans county.....	435,839 34	13,634	5,045
Essex county.....	141,835 00	4,226	952
			25,991

Thirteen towns in New Hampshire border-  
dering upon Connecticut river..... 11,159

Tons..... 37,150  
The number of passengers in stage coaches which pass Haverhill and Newbury per year will vary little from 12,480.

The estimate of freights embraces agricultural products—merchandise, including salt, plaster, flour, etc.—copperas, lime and free stone, and manufactures except lumber.

The quantity of manufactured pine lumber ascertained to pass down the Connecticut at Newbury and Haverhill annually, is on an average 26,000 tons.

This article is greatly deteriorated by being rafted and lying so long in water as is required to reach a market—which consideration in connection with the uncertainty of the navigation of the river, the length of time required, and expense of tolls, raftsmen, etc., render it certain that all the most valuable kinds of lumber will be transported by the railroad as soon as it is completed. These statistics it will be seen have reference only to way freights along the line, to which should be added a further amount from the "Eastern Townships" of Canada which are to a considerable extent under a high state of cultivation.

But while this local business is important and will be continually increasing, it will embrace but a moiety of the business of the road when it shall have formed a connection with the Canadian railroads now projected and in course of construction.

**The St. Lawrence and Atlantic railroad,** extending from Montreal through the "Eastern Townships" to the line, is already under contract from Montreal to Acton, 45 miles, and the work of grading has been commenced. A portion of the iron for the track has been purchased, and this division of the road is to be completed in 1848. The construction of the remaining distance to the line will be prosecuted subsequently, coincident with the work on this side of 45°. This St. Lawrence and Atlantic railroad is authorized to construct a branch from a point below Sher-

brooke to connect their railroad with the city of Quebec. Sherbrooke is 30 miles from the northern terminus of the Connecticut and Passumpsic Rivers railroad, and the point for the intersection of the Quebec branch is nearly equidistant from Quebec and Montreal—about 85 miles.

The country being nearly level, and favorable for constructions, this branch to Quebec can hardly fail of being built; especially as it will form an avenue from that city not only to the Atlantic cities, but also indirectly to Montreal by railroad.

When these works shall have been completed, it will be seen that the Connecticut and Passumpsic Rivers railroad must do an extensive *through* business to Montreal, while it will form almost a direct line for passengers from Quebec to Boston, and, in connection with the lines in the valley of Connecticut, to the city of New York.

The amount of pleasure travel from the United States via Niagara Falls and Lake Champlain to the cities of Montreal and Quebec is very considerable and is annually increasing.

When, therefore, the lines of railroad now in progress of construction shall have been completed, it is reasonable to suppose that either in going or returning, a majority of this pleasure travel will pass over the Passumpsic line.

#### Annual Reports of the New York Railroads.

CATUGA AND SUSQUEHANNA RAILROAD COMPANY.  
To the Honorable the SECRETARY OF STATE, of the State of New York.

The Cayuga and Susquehanna Railroad Company, in pursuance of the sixteenth section of the act of incorporation of said company, beg leave to report:

That since the first day of Jan., 1846, the date of their last report, to the first of January, 1847, the amount of receipts for passengers and transportation upon said road, is seventeen thousand one hundred and fifty-eight \$9-100 dollars, (\$17,158 29.)

The expenses incident upon carrying passengers and transporting of goods, wares and merchandise upon said road, is six thousand eight hundred and one 44-100 dollars, (\$6,801 44.)

The expenses for repairs of road are five thousand five hundred and sixty-two 54-100 doll., (\$5,562 54.)

The expenses for repairs of locomotive and cars, are two thousand one hundred and ninety-three 58-100 dollars, (\$2,193 58.)

All of which is respectfully submitted.

DANIEL L. BISHOP.  
W. R. HUMPHREY.

ALBANY AND WEST STOCKBRIDGE RAILROAD COMPANY.  
Hon. N. S. BENTON, Secretary of State.

Sir—The directors of the Albany and West Stockbridge Railroad Company submit the following report, for the year ending December 31, 1846:

1. Length of the road in operation under the lease to the Western Railroad corporation, 38½ miles.
2. Cost of construction to Dec. 31, '46, \$1,777,019 57
3. No. of thro' passengers..... 76,412  
do way do ..... 37,914
4. The expenses for road repairs, including the repairs of buildings, ferry boat and docks in the city of Albany, paid by lessees..... \$17,500 62
5. No locomotives or cars of any description are owned by the comp'y.
6. No men or horses have been employed by the company.
7. One machine shop is owned by the company, at Greenbush.
8. The number of miles run by passenger trains of the lessees..... 57,503
9. The number of miles run by freight trains..... 102,979

10. The number of miles run by all other trains..... 15,182
11. There is no income. The lessees pay the interest on the bonds of the city of Albany, which amount to \$1,000,000, as rent.

MARCUS T. REYNOLDS, Pres't., &c.

#### HUDSON AND BERKSHIRE RAILROAD.

The Hudson and Berkshire Railroad Company, pursuant to Assembly resolutions of February 24, 1843, report as follows for the year ending December 31, 1846:

The length of said road in operation during the season 31 miles.

The original cost of constructing the whole, including outfit, and as heretofore reported.....	\$575,613 00
Amount paid for the construction and purchase of cars for the year 1846, about.....	5,400 00
Income for through passengers for '46 do way do do	2,852 00 5,385 82

Total income for passengers..... \$8,237 82

Income from freight and other sources, for 1846..... \$28,805 00  
Expenses of repairing and running the road for 1846..... 27,600 00

No. of thro' passengers for '46, 2,852 do way do do 14,796 do miles run by all trains.. 34,660 do locomotives used by the company during the year.... 4	
No. of passenger cars used by the company..... 3	
No. of freight cars used by the company..... 42	
No. of machine shops..... 1	
do horses..... 5	
do men employed by company during most of the year... 37	

All which is respectfully submitted this first day of January, 1847.

J. W. FAIRFIELD, Pres't.

#### TROY AND GREENBUSH RAILROAD COMPANY.

Hon. N. S. BENTON, Secretary of State.  
Herewith is submitted the report of the Troy and Greenbush Railroad Association for the year 1846, pursuant to a resolution of the Assembly, passed February 24, 1843.

The Troy and Greenbush Railroad, extending from the city of Troy to Greenbush, opposite the city of Albany, is 6 miles long.

The cost of construction to Jan. 1, '47, \$256,862 75 Received from 340,036 passengers.... 31,966 60 Received from freight..... 16,023 69 Received from other sources..... 661 15	
Expended for repairing and running road..... \$39,927 93 Expended on construction..... 23,491 36 Dividends..... 6,969 21	

The number of locomotives is..... 3 do passenger cars, (eight wheels,)..... 3	
Number of freight cars, double, (equal to single,) is..... 19	
Number of machine shops..... 1	
Average number of men pr day..... 40	
Number of miles run by passenger trains..... 47,873	
Number of miles run by freight trains..... 3,840	
Number of miles run by gravel and other trains..... 1,060	

H. STRATTON, Accountant.

#### NEW YORK AND ERIE RAILROAD COMPANY.

Hon. N. S. BENTON, Secretary of State.  
Sir—The directors of the New York and Erie Railroad Company submit the following report of their proceedings, and also of their receipts and expenditures, pursuant to the 19th section of the act incorporating the company, and in compliance with the resolution of the Assembly, passed February 24, 1843.

In the last annual report which contained a statement of the affairs of the company to the 30th of

September, 1845, it was stated that a subscription to the stock, amounting to more than three millions of dollars, as required by the act of the Legislature, passed May 14, 1845, had been procured up to Jan., 1847, the date of this report; there had been paid in instalments thereon \$385,391 15, and a further instalment of ten dollars on each share had been called for. By the provisions of the acts of May 11, 1846, the active operations of the company were confined to the short section of the road between Middletown and the Shawangunk summit, until the commissioners appointed by those acts should decide upon the location between the last named point and Binghamton. The work on that section was vigorously prosecuted, and the road was opened to Otisville, 62 miles from Piermont, on the first of November last.

The decision of the commissioners in favor of the level route on the Delaware and Susquehanna rivers, was communicated to the board of directors on the 25th of August last. The work on the road from Otisville to the Delaware river was immediately commenced, and proposals for grading 130 miles from Port Jervis to Binghamton were issued, and the whole line has been put under contract, on terms considered favorable to the company. The contractors have commenced work at numerous points in this state and in Pennsylvania, and it is expected the whole line will be completed during the summer of next year. Contracts have also been made for all the iron rails required for the road as far as Binghamton.

The grading of the branch from Newburgh to Chester was commenced last spring, and the work is now in progress.

All liens upon the property of the company, except the State lien, have been discharged.

The receipts of the company from all sources, from the 30th Sept., 1845, to Jan. 1st, 1847, were.....\$1,160,734 68

The expenditures during the same time, on account of construction and materials, repairs and running the road, and for all other purposes, were.....917,635 51

Leaving a balance unexpended, on the 1st of January, 1847, of.....\$243,099 17

Tabular statement relative to the New York and Erie Railroad, made to the Secretary of State, agreeably to a resolution of the Assembly, passed Feb. 2d, 1843, showing the business of the road for 1846.

Number of miles in operation, 62.  
Cost of construction (53 miles, including pier), to January 1st, 1846.....\$2,084,408 25  
Expended on 9 miles previous to 1846, 183,927 25  
do construction in 1846.....292,682 69

Total cost of construction, 62 miles, to 1st Jan., 1847.....\$2,561,018 56

Expenses for repairing and running the road, and ferry expenses.....\$123,173 97

Number of through passengers, 16,920  
do way do 86,368 1

Receipts from through passengers....\$19,637 87  
do way do 45,116 86

Total income from passenger....\$64,754 73

Income from freight and U. S. mail..\$120,761 75

No dividend has been made.

No. of locomotives.....9

do passenger cars.....9

do freight cars.....66

do mail and other cars....60

do machine shops.....1

do horses.....none.

do men (average) employed on the road.....134

No. of miles run by freight and other trains.....58,974

SHEPHERD KNAPP.  
THOMAS J. TOWNSEND.

#### NEW YORK AND HARLEM RAILROAD COMPANY.

In compliance with a resolution of the Assembly, passed February 2d, 1843, the New York and Harlem Railroad Company makes the following report:

The entire length of their road completed and in operation, is about 42 miles, extending from the City

Hall in the city of New York, to New Castle, in the county of Westchester. About eight miles is a double track, and the whole road run by steam is laid with heavy H rail, from 32d street to New Castle.

In addition to this, the company has completed the grading, masonry, and bridges upon the residue of the road in Westchester county, (about 11 miles,) upon part of which the superstructure and iron has been already placed, and the residue will be completed, and the whole road through Westchester put in operation as soon as the opening of the spring will permit the company to resume the laying of the track. The expenses of the extension of the road from White Plains to the Putnam line, already amounts to upwards of \$490,000, and when completed are estimated at \$570,000, the vouchers for which will be rendered to the comptroller in May next, pursuant to the act of the 11th of May, 1846.

Number of miles of road in operation, about 42.

Cost of construction of road from the City Hall to south side of Harlem river bridge, 8 miles, per mile.....\$104,375 00

From south side of Harlem river bridge to Williams' bridge, including bridge, 6 m., per mile.....38,475 00

From Williams' bridge to White Plains, 13 miles, per mile.....11,277 00

For a portion of the road graded under former contract, and not used, pr m. 1,384 00

From White Plains to Putnam line, 25 miles 82-100, present cost, per mile, 19,300 00

Total expenses of constructing the road from the City Hall to Putnam county, 52 82-100 miles.....\$1,702,077 88

Expense of running and repairing the road for 1846.....\$88,737 47

Total income from passengers.....\$170,923 44

do do freight.....11,882 27

.....\$182,805 71

Number of passengers through.....58,466

Number of way passengers no account kept, but estimated at.....1,450,000

Dividends none.

Number of engines.....8

do train cars.....21

do city cars.....21

do freight cars.....21

do baggage cars.....5

do machine shops.....1

do horses.....152

do men daily employed..150

Number of miles run by passenger and freight trains, no account kept.

JOHN H. DYKERS, Pres't.

#### Railway Accidents.

We copy an account of a serious accident which occurred on the London and Northwestern railway, near Wolverton, on the 5th of June. This appears to be one of those extraordinary accidents against which human foresight and care cannot always guard—and as it is of the utmost importance that renewed and constant vigilance should be exercised by all persons employed upon, as well as having charge of, railroads, we give the editorial remarks of several of the English railway journals, in the hopes that useful hints may be derived from them, and prove beneficial to our readers.

"London and Northwestern Railway.—

On Saturday night a fatal accident took place on the London and Northwestern railway, near Wolverton station, involving serious damage to property, the loss of seven lives, and injury to other passengers. The down mail train for Liverpool, consisting of nineteen carriages, started at a quarter before 9 o'clock on Saturday evening from the Euston square terminus, and was due at Wolverton at 15 minutes before 11. The train was heard approaching the Wolverton station at the proper time, and the signal, indicating that all was right for the train to enter the

station was hoisted, but, to the astonishment of the officers at the station, the train turned off into a siding, instead of coming down the main line, and in an instant after a fearful crash was heard. On the superintendent of the Wolverton station reaching the spot, a shocking scene presented itself. The mail train had entered the siding commencing near the bridge, usually appropriated to coal and merchandise wagons, and had come into collision with five or six wagons laden with coal. The fifth and sixth carriages of the mail train were literally smashed to pieces, and were strewn about the line, together with the passengers, while, singular to relate, the engine and tender, and all the carriages in front of them, which consisted of the Liverpool and Manchester parcels' vans, and two second class carriages, were almost uninjured. Seven persons who were in the sixth second class carriage were found either dead or dying, scarcely half an hour having elapsed from the time of the occurrence before they had all ceased to exist. Body after body was removed from the line to one of the anti-rooms of the Wolverton station, where they were at once seen by Mr. Rogers, surgeon, of Wolverton, in the employ of the company, and by two other medical gentlemen, who happened to be in the train at the time of the collision. From some cause, yet to be explained, the signal man appears to have gone to the points, a distance of forty or fifty paces, and to have turned the train into the siding. This error was not discovered by the engine driver until he had passed the points a considerable distance. Upon seeing the danger, he instantly applied the breaks, turned off his steam, and reversed his engine, and then both he and the fireman jumped off onto the embankment, and thus in all probability saved their lives. The train was at this moment going, it is stated, at a rate not exceeding ten miles an hour. The only explanation afforded by the signal man was, that he afterwards thought it was not the mail train but a luggage train, and he acted as he did for the purpose of securing its safety. This statement, however, being very much doubted, the superintendent of the Wolverton station felt it his duty immediately to give him into custody. From cards and other evidence discovered on the persons of the deceased parties, their names are supposed to be as follows:—Mr. J. B. Ratray, belonging to an iron foundry at Dundee; Mr. Miller, secretary of a London ragged school; Mr. James Clifton, supposed to be from Coventry; Mr. T. Mackinson, a collegian of Cambridge; Mr. T. Skerratt, and Mr. Cooper, not known where belonging to. The seventh is the body of a respectably attired young man, who had nothing upon him to lead to identity. The bodies were removed to an outhouse at the Wolverton station, where they now lie awaiting a coroner's inquest. In a collision attended with so fearful a loss of life it might be expected that many passengers would be injured, but the official report states that this is not the case. One gentleman had a rib injured, and two others were much shaken;—but with these exceptions the other passen-

gers were not seriously hurt. The guards of the train had a most miraculous escape. The chief guard, Haines, was actually sitting on the carriage that was destroyed, and on seeing that a collision was inevitable, threw himself, at all risk, off the top, down the embankment, and escaped unhurt. The second guard also followed his example and was uninjured. On Monday, an inquest was held on the deceased, and afterwards adjourned to Friday, when our reporter attended, but the evidence adduced yesterday has not thrown any new light upon the cause of the catastrophe. The train had the proper signal lamps, and was only two minutes before time. A white light was seen by the driver at the signal post, signifying that all was right, and immediately after, in consequence of the points having been shifted, the train rushed with a jerk into the siding. It is not true, as reported, that the driver and stoker threw themselves off the engine. They stood at their posts, at the imminent danger of their lives, up to the moment of the collision; and Mr. M'Connell, the locomotive superintendent, stated, that the courage and good conduct displayed by them and the guards would be strongly marked with approbation. Nothing has arisen to account for the extraordinary conduct of Fossey in shifting the points. As to his plea, that he mistook the train for a goods train, evidence was given that a goods train and a mail train never arrive at that station within half an hour of one another. At six o'clock, the coroner having intimated that the inquiry must be carried over to another day, our reporter left."

Herapath says, "Misfortunes," they say, "never come singly;" and so one would conclude, if we look at railway accidents. In the fall of 1841 the accidents poured in, one on the heels of another, with fearful rapidity. In the following year, about the same time, they did the same, and so they have at other periods. We have now a lamentable illustration of the trite truth of the old adage, in the fall of the Shrewsbury and Chester bridge, the running off of the Brighton engine, and in the dreadful accident of Saturday night, given in another column, on the London and Birmingham. In the last, seven lives have been lost by the wilfulness or madness of one man. It is useless to mince the matter; we can give it no other name than madness or wicked design. A man knows of a particular train coming, he sees it; for it was not dark—there is no real darkness at this time of the year; and he signals it as the train he expected, and yet he goes and turns the switches for a train of another description! However charitable we may be disposed, it is impossible to contemplate the matter, without coming to the conclusion that it was the effect of wilfulness or insanity.

The misfortune of this lamentable affair is that there is no guarding against it. Discretion, prudence and care on the part of directors, are all set at defiance by such conduct, and there is no way of dealing with it for the sake of the public, but as a proceeding of wanton wilfulness on the part of the switchman. Had it been an accident from not do-

ing his duty, we might find some extenuation in our mind, by imagining that the man had for the moment forgotten one part of it. But, no; he hears the train, he sees it, he signals it as the true train; and, instead of resting satisfied with that, which was his whole duty, and would have been all right, he goes and does more than was required, and directly contrary to what he had heard, saw, believed and communicated to others. It might be considered harsh to say, that it was wilfully done; but the only other explanation is positive madness, and against that rises up his having seen and signalled truly. We regret it much; but the safety of the public would lead us to take up the stronger feeling against this man, and to demand a corresponding punishment. If such matters are dealt with lightly, we have no security for the public. There are cases in which lenity is crime, we and verily believe it would be so here. We should not look at the individual, but the millions that are constantly travelling about on railways at the mercy of such men. Are their lives to be set at naught, and the multiple of millions more depending on them for support; there is an instance in this very accident of 500 men with their wives and families, amounting probably to 3,000, being thrown out of bread by the death of one of the unfortunate victims of Fossey's conduct! It is dreadful to think of the amount of mischief that one man may be the cause of over and above the immediate victims.

We have heard, but on no good authority, that the company have taken on themselves the expenses of the several funerals. They will no doubt do all they can to alleviate the misery that has been caused."

The editor of the Railway Record says—"The public mind has not yet overcome the astonishment and alarm caused by the terrible accident of Saturday night last. Those who have had the best opportunities of observing the detail management of the London and Northwestern company's lines, and comparing it with the system pursued in other great railway establishments, have so generally accorded the palm of superiority to the concern presided over by Mr. Glyn, that the mention of an accident, be the causes what they may, excites a much greater sensation than could be occasioned by a casualty on a line whose prestige for safety and careful superintendence was less confirmed.

The misfortune has certainly been a tremendous one; and its alarming character is not mitigated by the fact that (so far as appears from what has transpired up to the time at which we write) no human foresight could have adopted any plan for the certain and effectual prevention of such accidents. Whatever was the nature of the mistake or delusion under which the man Fossey acted, that mistake bespoke in itself, so utter a perversion of the faculty of rational distinction, that it is impossible to conceive any set of regulations that could secure the traveller from the effects of such insanity.

It is the inalienable condition of every description of extensive commercial operation, that its movements must depend, in various

stages, on the prudence and steadiness of an individual. The accommodation given to the public by the introduction of the locomotive engine, is, very essentially, a commercial transaction; quite as much so as was, in former days, the agreement between the passenger and stage coach proprietor, whereby the latter bargained to convey the former, for a given sum, between Birmingham and London. A drunken or careless coachman might, at any time have caused the death of every one committed to his charge. A mere twitch of the bridle—the turning of a horse's head out of the direct line of road—would have been sufficient to plunge the whole equipage down a precipice of frightful depth and to consign all to a sudden and dreadful death.

The contingency of this danger attended all coach travelling, and every passenger was necessarily subject to it. If a coachman had been seized with madness—if a driver of steady character had indulged in a stealthy fit of drinking, and, under the influence of that drink, had caused any such calamity as we have supposed—no one would have thought of making either the system of coach travelling, or the proprietors of stagecoaches blameworthy or responsible for the consequences. All that would have been uttered, would have been exhortation to the greatest care in the selection of the servants to whom such important duties were entrusted; and if satisfaction were afforded that reasonable pains had been exercised in this regard, it would have been universally acknowledged that everything had been done which the public safety and interest could require.

Now, a railway casualty should be judged by the same rule of consideration for the natural sequence of cause and effect. It will then be seen at once how unfair and unreasonable is the outcry that lays the blame of every accident at the door of some alleged negligence on the part of Managements. Examine the circumstances of the disaster of Saturday last. The train was proceeding regularly to its destination, when a policeman, named Fossey, actually altered the points of the siding from their proper position, in order to turn the carriages into it. No motive can be conceived that could have impelled the man to this act; it was an act which no one could expect or anticipate: it could no more have been provided against than could the murder of Mr. Perceval by Bellingham, or that of Mr. Drummond, four or five years ago, by the lunatic M'Naghten. It was one of those exceptional and isolated instances of infatuation for which we must always take the chances, and comfort ourselves with reflections on the infrequency of such evil developing itself. As Mr. Hudson observed very pertinently, a few evenings ago, in the house of commons, it would be well if the gentlemen who indulge in severe comments on such disasters would themselves favor the world with tangible suggestions as to the 'preventive' measures they call for. The truth is, that they cannot. To preclude the chance of such calamities, they must first contrive some prescription for making human

nature perfect; or must, at least, devise some mode whereby railway directors shall be enabled, by intuitive knowledge, to read the secret workings and impulses of the mind.

Our belief and conviction are, that the London and Northwestern company are as desirous as any party, parliamentary or otherwise, that every point bearing on the causes of the accident be cleared up. It is the interest of the company that this should be done, if they have fulfilled their duty and engagement to the country, viz: of taking due preliminary care with regard to the character of all the servants employed by them. This is the point whereon the question as to their conduct must revolve; and, as to this, we must await the issue of the inquiry.

This is the position of the London and Northwestern direction, in so far as relates to its accountability for the recent deplorable catastrophe. But we cannot too strongly insist on the importance of taking every available step for lessening the probability of such misfortunes. It is not to be forgotten that, however complete may be the power of a railway company to clear itself from the random charges which ignorance and malice are always ready to bring forward, the mere occurrence of frequent accidents is a circumstance tending in itself to create a public prejudice, which may operate very deleteriously to the railway interest.

The condition of the 'working establishment' on the London and Northwestern lines has long been subject of admiration to travellers; and we have reason to believe that there is no company less sparing of expense, for the purpose of maintaining a high state of efficiency in this department. But we entreat the management, and all those whom it favors with its confidence, to carry with them the fact, that the quality of the human agents is a point of even greater importance than that of the carriages, engines and rails. The finest 'stock' in the world will be worked with disgrace and disaster, where the servants are not endowed with prudence, experience and sobriety. Let every thing, then, be done to encourage steady and intelligent men—to retain those of proved experience and good conduct, and prevent them from seeking service with other establishments, through the disgust that ever springs from anything like favoritism or personal preference. There is no company more entirely in possession of the means for securing to itself the highest class of ability in all branches of its business—no company can better afford to reward faithful services, and to give its employees the most effectual stimulus—that of a feeling of personal and permanent interest—to the scrupulously diligent discharge of their respective duties. If, by such wise and really economic liberality, the occurrence of fatal accidents cannot be altogether precluded, the satisfactory position will at least have been attained that everything in the power of man has been done towards promoting the safety of passengers, and excluding even a pretext for the nonsensical and calumnious rigmaroles of the Sibthorps, and the Morrisons, and their 'kindred spirits.'"

#### Patent Law.

Extract from the last report of the Hon. Edmund Burke, Commissioner of Patents. It is a plain spoken document, and deserving of consideration by those who make use of the inventions of ingenious men without giving a fair consideration.

"In my last annual report I had the honor to submit to Congress a proposition for certain modifications of the existing patent law, which I deemed important and necessary for the protection of the inventor, as well as the public. A bill, embodying most of the modifications suggested, was reported in each House, by the committee having the matter in charge; but in consequence of the great amount of business pressing upon Congress at the last session, it failed to become a law.

"The bill provided for two important and essential changes in the existing law in relation to patents. One of those provisions was, that all suits brought by the patentee for infringements of his invention should be received by the courts trying the same, as conclusive evidence of his right to recover damages, until they were set aside by the institution and prosecution to final judgment of a process for their repeal. The other was a provision for the institution of a process for the repeal of letters patent which had been obtained by fraud, misrepresentation, or upon false suggestion, or which were void, in whole or in part, for want of novelty, or other cause. The very inadequate protection afforded to the patentee by the present law, seems to me to furnish sufficient reason for the proposed modification.

"After the rigorous and searching ordeal through which every invention passes at the Patent Office, it certainly seems reasonable that the letters patent, under the seal of one of the officers of the government of the United States, should be received in courts of justice as conclusive evidence of the title of the patentee to his invention and his right to recover, until his patent shall have been revoked and annulled for good and sufficient cause, by a tribunal competent to investigate the matter.

"But the present law extends no such protection to the patentee. At present his letters patent are only *presumptive* evidence of the novelty of his invention, and of his right to recover. Consequently, the validity of his patent may be, and for the purpose of embarrassment often is, put in issue in suits for infringement, and he is compelled to prove the novelty of his invention, over and over again, as often as the depredator upon his rights, whom he seeks to punish, is disposed to put him to that trouble.

Many instances of this wanton aggression upon the rights of the meritorious inventor have come to the knowledge of the undersigned since he has had the honor to be at the head of the Patent Office. And many of these instances of aggression proceed from wealthy and powerful companies and corporations, and the subjects of them are the inventors of the most useful and valuable machines and improvements. The more valuable the invention, the more liable it is to piracy and infringement. These wealthy

and powerful bodies know well the benefit to them of the law's delay, and its ruinous expense to the single-handed individual who dares to resist their unlawful and unjust invasion of his rights; and hence, in the end, they hope to win, either by the defeat of the patentee by means of some trifling defect in his title deed, or his inability to procure the necessary evidence to substantiate his right, or by a compromise, in which he will be forced to sacrifice a portion of his claims in order to relieve himself from the embarrassment and expense of the unequal contest.

"As the law now stands, the great burden of the controversy falls upon the patentee, and not upon the wanton violator of his rights, as it should.

"In this view of the matter I think all candid men will agree that when a patentee has established, in the judgment of the office or tribunal whose duty it is to pass upon his claims in the first instance, a right to letters patent of the United States, that document should be his shield and protection, until it is shown by others, who dispute his title, that he has no right to it.

"I am aware that there is a prejudice existing in the minds of a portion of the community (small, I believe it is) against the claims of inventors. It is contended by some, that patents, securing exclusive rights to the discoverers of new machines or processes of manufacture, are monopolies, operating to the detriment of the best interests of the community, and existing against the true policy of all just governments; and therefore are to be regarded with suspicion, construed with great strictness, and defeated if possible.

"I am fully persuaded that, on a little reflection, such a view of the rights of inventors will disappear from the minds of candid and reasonable men. What are the grounds on which all civilized and enlightened governments grant to persons making valuable discoveries in the arts and manufactures a limited monopoly of the benefits of their inventions? The main ground is to encourage discovery and invention—those great agents of social improvement—by securing to those who make them the profits which result from them, in order to enable them to remunerate themselves for their toils and expenditures, and to induce others to explore the vast and limitless field of invention.

"Every new discovery in science and art contributes to the wealth, convenience and comfort of individuals, and to the improvement of society. Some of the inventions of the last few centuries have burst upon the world with the brilliancy of the morning sun—changing the whole aspect of society, and conferring incalculable benefits upon the human race. I need only mention the art of printing, the discovery of gunpowder, the steam engine, the cotton gin, the spinning jenny, the power loom, the steamboat, the railroad, and the magnetic telegraph. These great discoveries in science and art have revolutionized the condition of the civilized world, and their influence at this moment is probably more potent and more sensibly felt than ever before.

"I mention these great discoveries as striking instances of the effect of the labors of the inventor upon society and civilization. There are others of less note, producing their due influence upon the condition and welfare of the world. Even the most humble discovery contributes its due proportion to relieve the human family of its burdens, and administer to its comforts, and to accelerate and aggrandize its unceasing triumphant progress in the improvement of its condition, and the expansion and perfection of its lofty nature and destiny.

"Therefore, there is ample reason why society should reward and encourage that class of its benefactors whose claims I am now considering, by securing to them, for a limited term, the exclusive enjoyment of the fruits of their genius and labors.

"But it cannot be denied that, upon the principles of abstract justice, the inventor has a complete and unquestionable claim to the fruits of his discoveries, until his labors and sacrifices are adequately remunerated.

"Many valuable and profitable discoveries in the arts are the result of a sudden and lucky conception in a happy moment; but most of them are the fruits of days and years of incessant toil, anxious and harassing thought, and great pecuniary sacrifices. This toil, this mental effort, and these pecuniary sacrifices, establish a title to the product which is their offspring, as sacred and irrefragable in the eye of justice as the title to his farm, his workshop, or his merchandise, which a man has acquired by his labor, skill and economy. So clear and convincing is the view of the right of the inventor to the fruits of his genius and labor, that argument in its support would seem to take from its strength. Yet the reasons are equally strong, that the inventor's exclusive enjoyment of his discoveries should not be perpetual, but should be permitted only for a limited period.

"All inventions, great and small, generally have their period of birth, growth, maturity, and perfection, if the latter term be allowable. And if one mind conceives and gives birth to the first idea, many assist in its development and expansion. Probably no piece of mechanism was ever made which was perfect in all its parts at its first creation. The steam engine is an interesting and beautiful illustration of the gradual progress of an invention, from its first conception in the mind of the inventor to its present wonderful state of perfection and efficiency. It first appeared in a rude form, unwieldy and dangerous to those who dared to operate it—a thing designed more for experiment than utility; and now, after passing through nearly two centuries of improvement, and taxing the highest intellectual energies of thousands of ingenious and skillful men, it appears to us with a perfection, in the nice and delicate adjustment of its machinery, which astonishes and delights us, and an efficiency and power of action which enable it to confer the greatest and most lasting benefits upon mankind.

"The history of this wonderful engine and instrument of civilization shows as clearly and conclusively that the claims of the in-

ventor to the fruits of his genius should not be perpetual, as it does that he should be permitted to enjoy them until he is adequately remunerated for his labor and expenditures; for if his right to his invention were perpetual and exclusive, no other person could improve it, because he could not use his improvement with the original invention, and therefore not at all. This would immeasurably retard, if not wholly prevent all improvement of original inventions, and would result in incalculable injury and mischief to society.

"Hence, while admitting the unquestionable justice of the claim of the inventor to the fruits of his genius for a period of time sufficient to enable him to remunerate himself adequately for his toils and expenses, it is absolutely necessary, for the progress of improvement and the welfare of society, that his exclusive right should then cease, and his invention become the common property of the public. Others will then have an opportunity to remedy the defects of, and to improve and perfect his original creations.

"And, in accordance with his view of the subject, the Constitution of the United States authorizes Congress to enact laws for the promotion of useful arts and the protection of the inventor in the enjoyment of the fruits of his genius and skill for a certain period, the duration of which is limited to fourteen years; at the end of which time, in consideration of such protection, his invention, and the secret of it, shall become the property of the public.

"I have been thus particular in setting forth the general principles of the patent law, because, as before remarked, a prejudice prevails to some extent in the community against the justice of the claims of the inventor to temporary protection in the enjoyment of the fruits of his labors. I am, however, happy to see that juster sentiments are growing more prevalent in relation to the rights of that valuable and meritorious class of citizens. During the past year courts of justice have displayed a more earnest desire to give protection to the inventor, as evinced by the liberal construction which they have given to the present imperfect patent law, whenever questions relating to patents have come before them for adjudication."

From the American Mining Journal.

#### Improvement in Treating Metallic Ores.

In the last number of the Journal and Gazette we gave an account of the recently patented method of smelting ores by electricity. We now give a specification of a patent granted a year or two since by the British Government to Mr. Frederick Bankhart, of Champion Park, Denmark Hill, in the County of Surrey, "for certain improvements in treating certain metallic ores, and refining the products therefrom." The invention relates to all ores containing copper, whether combined with sulphur or not; and consists in adjusting and mixing together the different ores which contain sulphur in other ores so adjusted and mixed, to successive roastings and lixiviations, whereby a solution of sulphate of copper is obtained, from which

the copper may be precipitated in a refined metallic state.

The method of carrying out this invention is as follows.—the copper ore is first reduced to powder, and the relative proportions of sulphur and copper which it contains are ascertained by analysis; then if the sulphur bears a less proportion to the copper than one to two, iron pyrites or copper pyrites, also pulverized, or added, in such quantities as will bring it to that proportion. If two or more descriptions of copper ores are to be treated, they must be mixed together in such proportions as will make the sulphur of the mixture bear to the copper at least the proportion of one to two; iron pyrites or copper pyrites being added, where necessary, to insure that proportion of sulphur. And there must always be a sufficient quantity of sulphur ores for the conversion of the copper into a soluble sulphate, and also to allow for the escape of part of the sulphur during the processes. The copper ore, prepared in this manner, is then submitted to such a degree of heat, in free contact with atmospheric air, as will oxidize the metals not already in a state of oxide, and convert the sulphur into sulphuric acid. For this purpose, a common reverberatory furnace is used, and the ore submitted to a dull red heat, in free contact with the air, until the mixture attains a state of seeming fluidity, and it is retained in that state until the evolution of sulphurous vapor nearly ceases; the whole of the mixture is not put into the furnace at once; but it is divided into several portions, and one portion being put into the furnace, another is added, when the first has attained a dull red heat, and so on until the whole has been introduced:—the mixture is frequently stirred during the process. The evolution of sulphurous vapor having ceased, or nearly so, the mixture is removed from the furnace to a vat or pit, and water (or a weak sulphate liquor from a previous lixiviation) applied at about the boiling temperature, and retained at that temperature for some time, by means of injected steam, to insure the solution of the sulphate of copper. When the sulphate of copper liquor is drawn off from the residual mixture, the latter is mixed with as much iron pyrites or copper pyrites as will supply the requisite proportion of sulphur; the whole is then subjected to a second roasting, and to a second lixiviation: this process of adjusting the proportion of sulphur in the mixture, and roasting and lixiviating, is repeated until the whole of the copper is obtained from the ore.

The next process is to precipitate the copper from its sulphate solution; after which it is to be fused, and run into moulds; it is then ready for sale as fine metallic copper. Various modes of precipitation may be adopted; but the patentee prefers to employ cast or wrought iron plates, keeping the solution at a temperature of from 120 to 150 degrees Fahr., and as nearly as may be of the same strength, by means of a circulating stream of fresh sulphate solution, which, entering at the top, and being conducted by a pipe downwards, tends, by its greater specific gravity, to displace the lighter solution; the latter

overflowing, is to be returned into the lixiviating vat, to be recharged with sulphate of copper, and this again precipitated, until the refuse liquid becomes a nearly saturated solution of sulphate of iron, when it is set aside to crystallize.

The patentee claims, as his invention, the mixing of the different ores of copper and iron pyrites in due proportion, according to the quantity of sulphur relatively with the copper which they respectively contain, and adjusting them in such manner as that ores which hold sulphur in excess may compensate others which are wholly or partially deficient in sulphur, and subjecting such mixture to a succession of roastings and lixiviations, (the residuum, after each roasting, having the proportion of copper to sulphur adjusted, as before,) and thereby obtaining a solution of sulphate of copper, whence the copper is obtained, by precipitation, in a refined metallic state.

#### Railway Breaks.

We find in the *Railway Record* for June 5th, the following account of *Crawford's Break* for railway carriages, and give it entire, with the conversation which took place at the Institution of Mechanical Engineers. Improvements in the break are as important as in the locomotive—as it is quite as important at certain times, to come to a stand, as it is at others, to go ahead.

At a recent meeting of the Institution of Mechanical Engineers, the following paper, on the improvement in railway carriage breaks, was read by Mr. CRAWFORD, C. E., (of Birmingham):—The railway carriage break in common use is open to several objections, but principally on account of its being very ineffective in all cases of emergency, as when a train gets off the rails, or an axle breaks, or some obstruction is in the way, with the train going at great speed, and but a short space to stop in; under which circumstances it is desirable that a great amount of retarding force should be applied, and as promptly as possible. Another great objection arises from the break entirely checking the revolution of the wheel, and causing the periphery to wear in flat places, particularly on lines of railway having steep gradients, and which may not unreasonably be suggested as one of the causes by which a train occasionally gets off the rail, and for which no very satisfactory reason is often assigned. To overcome these objections, I propose a mechanical arrangement for accumulating power, equal to a number of men, in proportion to the carriages on which breaks are to be applied, and with a means of connecting the breaks of the several carriages together, and of distributing the retarding force or friction on each, in proportion to its weight, and by which means the breaks may be as suddenly or gradually applied, as circumstances may require their intervention. To effect which, I submit two plans—either a cylinder with a piston, acted upon by compressed air, or the ordinary atmospheric pressure against a vacuum or a series of springs placed in a frame, in connection with the machinery for communicating motion to the breaks; giving a decided preference to

the latter arrangement, as the cheapest and least liable to get out of order. The connection may also be formed in two ways, either by a revolving rod running under the carriages, and fitted with a universal joint, and a socket at one end for the end of the rod on the adjoining carriage to fit into, or by means of fixed pulleys and chains placed under the floor of the carriage; but with either plan it is necessary that a spring should be attached to the lever of each break to regulate the amount of pressure to be applied, and to remedy any difference that may exist in the length of the connecting rods and friction blocks, or in any little irregularity that may take place in forming the connection between the carriages; and, if the spring be properly constructed, it is obvious that, however great may be the motive power by which the breaks are applied, no more than the requisite amount of pressure can possibly be thrown on the breaks of any particular carriage; but without the spring, unless the construction of all the parts and arrangements in connecting the several carriages together are exactly equal in every respect, (a circumstance by no means practicable,) the whole amount of pressure would probably be thrown upon one carriage, and not without great danger of fracturing some of its parts. In the adoption of any plan for suddenly applying a great amount of friction to stop the momentum of a train (as in the arrangement now open for discussion,) the application of which is only required at occasional and uncertain intervals, it is desirable that it should be constantly used to ensure its acting when fully required. I therefore propose to join the breaks of several carriages together, by either of the arrangements mentioned, and by placing the whole under the control of one guard. He would be able to use the breaks for the ordinary stopping of the train, by allowing the springs to recoil about half the length of the frame in which they are placed; or, should it be necessary, it would be in his power to throw on the whole effective force of the breaks by a simple motion of his hand. In the arrangement proposed, no alteration is made in the general plan of forcing the friction blocks against the wheels, by means of levers and rods attached to a horizontal bar placed underneath and at right angles to the length of the carriage; and, therefore, no considerable expense would be incurred in carrying out the arrangement—the addition of a spring attached to the break lever, with a series of springs for accumulating power, being all that would be required to perfect the arrangement. Should the springs accidentally become disarranged, the breaks may be applied by the hand, and those of each carriage may be separately used as the common break, whenever disconnected from the adjoining carriages. With regard to the construction of the springs, those made of a spiral form would be the best, if placed in a frame in which they could be regulated, by means of a nut and screw, to any desirable strength. As a proof of the durability of the spiral spring, I may mention that Mr. Salter, of

West Bromwich, has one that has been under compression for upwards of seven years without having lost any perceptible amount of power, although loaded with a sufficient weight to force the coils of wire perfectly close. In proof of the inefficiency of the present breaks, when most required, Mr. C. then proceeded to instance several accidents which had occurred in which the want of an improved plan was obvious. Mr. Crawford then explained, by the help of models, the action of his break, which is intended to be worked either by a cylinder or piston, or by a succession of springs, connected with the ordinary break.

The CHAIRMAN said that it was perfectly practicable to attach breaks to all the carriages in a train by the ordinary plan, and to connect them by chains and rods. Supposing the plan of Mr. Crawford and Mr. Chesshire's buffer were in use together, it would then require uniformity in the carriages. At present, on the narrow gauge, they had carriages belonging to different companies in one train, and no two companies' carriages were exactly alike.

Mr. CRAWFORD saw no difficulty in that, so long as the pulleys were put on the same side of the carriages.

The CHAIRMAN thought that it would require—first, all the companies to agree in adopting this invention; and, secondly, their departing from their present course of constructing their carriages, which would be a considerable expense.

Mr. CRAWFORD said it would not be necessary to have every carriage provided with a break; five or six would be enough in a train.

The CHAIRMAN remarked, that there were generally two carriages with breaks to each train at present.

Mr. CRAWFORD considered that the expense would not be more than 4*l.* or 5*l.* above the ordinary break. It could be applied without the slightest cutting up of the carriages.

Mr. FOTHERGILL said, that a steam break had been invented some years ago, which had not been carried out in consequence of the expense.

The CHAIRMAN thought that the result to be obtained would scarcely warrant the additional expense.

Mr. COWPER remarked, that the object of Mr. Crawford was to prevent accidents. The power of pulling up short was a gain, but he thought it might be effected by having an ordinary break to every carriage.

Mr. HENDERSON did not think the invention could be applied for the sum named, but thought if it were in itself desirable, the expense was not an objection. He questioned whether the stopping the wheels would stop the train.

The CHAIRMAN considered that a complicated machine like that, any part of which being out of order would stop the whole, was less to be depended on than a simple contrivance of less power.

Mr. WARD considered that a greater power of stopping the wheels would be an advantage, and that it was desirable that one man should have the power of effecting this.

Mr. CRAWFORD explained that he did not believe the stopping of all the wheels in a train would stop the train in less than 20 or 30 yards' distance. It would probably be sufficient for the purpose to check two-thirds of the wheels. In case of the machinery breaking (which he thought might be rendered almost impossible,) the ordinary breaks of the carriages might be used.

The SECRETARY—Providing you had a man in each carriage to do it.

After some further conversation, the CHAIRMAN expressed his conviction that they could not pronounce an opinion on the invention, and that probably Mr. Crawford would be satisfied with the examination it had undergone.

That gentleman assented, and the meeting then broke up.

#### Great Improvement in Iron Manufacture.

A gentleman of Newark, New Jersey, as we learn from the "Daily Advertiser" of that place, has recently patented a process of melting iron ore, and producing bloomed iron, which, in the judgment of those who have witnessed and examined the process, is an improvement of the greatest importance, not only to manufacturers, but to society at large. The patentee is Mr. Alexander Dickinson, a worthy gentleman of Newark, and his improvement consists in combining with a closed forge fire, a tight chamber with an opening at the top to fill in the charge of fuel and ore.

The value and importance of this simple invention, says the Advertiser, will be readily apprehended, when we say, as we do on the most reliable authority, that it saves half the coal and half the time required by the old method, and at the same time makes a better article—and equal to the best Russia or Swedes iron. It ordinarily takes from 300 to 350 bushels of coal to make a ton of blooms; and the old forge fire will make three tons of iron per week, by working day and night, without intermission.

The plan now introduced, it has been proved by satisfactory experiment, would produce double the amount, in the same time, of a far better article, and at a saving of half the cost in fuel—which, when we take into account the total amount of iron manufactured in our country, would make an immense saving, besides furnishing a better quality of iron. It requires but a moment's reflection to see that this improvement is therefore a matter of national consequence and general congratulation. The use of iron is becoming every day more universal. It now enters in a great part of all the economical enterprises of society, and this simple invention, by increasing the production and lessening the cost, can scarcely fail greatly to extend the use of it—and that without dependence upon a precarious tariff.

These startling statements are satisfactorily verified by the testimony of one of the oldest and most respected iron masters in the Union, Colonel Jackson, of Morris county, and his testimony is corroborated, if corroboration be necessary, by Seth Boyden—a machinist and inventor whose opinions on these subjects

have the weight and authority of demonstrations.

We find the above in Mining Journal of New York. We have before seen it noticed, but were inclined to believe that the claim was altogether too great to be correct, but shall be highly gratified to learn that it is literally correct. That important improvements will be made in this mighty field for American industry, skill, and capital, we have no doubt. It is only necessary to bring mind and capital to bear upon the iron business, in this country, to make us exporters, as we have heretofore been—and now are, importers of the article.

#### Railroad Items.

The several railroad companies between Albany and Buffalo are relaying the road with the heavy iron rail, as fast as iron can be procured. The Utica and Schenectady company have about three hundred men constantly employed, and will probably have the new rail all laid within twelve or fifteen months. This company is also grading an additional track by the side of the old one. The Syracuse and Utica Company have a large force employed, and will this season relay with a heavy rail the track from Rome to Utica—fifteen miles. The Auburn and Syracuse Company have commenced putting down the heavy rail, and will finish as much as possible this season. The Auburn and Rochester Company are preparing to lay the heaviest iron rail in the United States, and will probably not be behind the other roads in carrying it to a speedy completion. The Attica and Buffalo Company are preparing to lay down as much of the heavy iron as they can this season, and will complete the whole in another year. The Tonawanda Company intend to relay their track, between Batavia and Attica, with a heavy iron rail, during next summer, and to put down the heavy rail between Batavia and Rochester as soon afterwards as possible.

From present indications, the entire line from Albany to Buffalo, will be relaid with heavy iron by the fall of 1849.

The whole line of the railroad from Saratoga Springs to Whitehall, in Washington county, N. Y., at the head of Lake Champlain, is now under contract, and the work will probably be completed so as to accommodate the next year's travel, or at furthest, by the 1st of July, 1848. The road is to be of the most solid and approved construction. This will be a profitable road, without doubt. Besides the lines of packet boats on the Champlain Canal, there are now six or eight different stage coaches, in constant employment, to convey passengers to and from Saratoga, and the Champlain steamboats. A good railroad will attract still more travel to the North by way of Whitehall and the Lake. When the present awful railroad from Troy to Saratoga is relaid with a good solid T rail, it will become a favorite route to Montreal, Ogdensburg, etc. A road is contemplated, too, from Whitehall to Rutland, or some point on the route of the Rutland road—a distance of some 20 miles—which will make a route from Whitehall to Boston that way, very little, if any longer, than by the way of Troy and Albany.

The entire track of the New Haven, Hartford, and Springfield railroad, with the exception of about four miles between Hartford and Berlin, has been relaid with heavy T rail. A difference of thirty minutes is made in the running time between Hartford and New Haven, and about one hour in the running time through. The line between New York and Boston, via New Haven, goes through in about twelve hours, and is a very delightful route, as it passes through some of the pleasantest villages of New England.

We understand that the trustees of the town of Portsmouth, Virginia, have purchased the Portsmouth and Roanoke railroad from the board of public works of that State, under the act passed at the last session of the Legislature, for the sum of \$50,000, upon a credit of six years, and that they have sold the road to Messrs. Henshaw & Co., of Boston.

The new company will immediately lay down T rails from Portsmouth to Welden, and will also extend the road thirteen miles further in order to connect with the Raleigh and Gaston railroad.

The receipts of the Long Island Railroad Company are daily increasing, and the expenses decreasing. A very important reduction in the expenditures of the company is in contemplation.

The Morris and Essex Railroad Company have declared a semi-annual dividend of 3½ per cent.

A new line for Boston is about to be opened, consisting of the Worcester and the Rhode Island. These boats are to run to Providence, in opposition to the Bay State at \$2 through. The result of this will probably be a break down of the fare on all the routes, and another season of unprofitable business on the Sound.

Notice is given that the interest due on the Harrisburg railroad bonds, on the 1st July, will be paid at the Girard Bank.

**Railroad Commissioners**—The Governor has, we understand, appointed John Wilkinson, of Syracuse, Henry B. Gibson, of Canandaigua, and Timothy Childs, of Rochester, Commissioners to settle difficulties between the Troy and Schenectady and the Utica and Schenectady Railroad Companies, as authorized by a law passed May 7, 1847.

**The Telegraph Lines**—The Albany Evening Journal refers to the two new Telegraph inventions which are about to be put in operation at the north, and the fact that merchants of New York have subscribed the stock for new lines of telegraph from New York to Boston, and from New York to Philadelphia. It says House's patent will work—but it is more complicated than Morse's. Pease's invention, however, it considers a gem—simplicity itself. A child, it adds, can catch the entire philosophy of it at a glance. If it works well, it will prove a successful competitor for the golden glories of the system. The Journal does not complain of the courtesy nor the accuracy of the present lines, but it thinks the public convenience may be promoted by other lines; and winds up with the following very apposite remark in which

all editors will unite: "Competition is the life of business; and while it may not make lightning travel any faster, it may make it perform its astonishing functions at more moderate rates."

**Telegraph under Water.**—The Electric Telegraph from Portsmouth, England, to the Isle of Wight, has been found to succeed admirably, on a trial, with even only one wire laid down under water. We heard that the telegraph on the Philadelphia and Baltimore line passes under the waters of Gunpowder river, and operates also successfully.

**ATLANTIC AND ST. LAWRENCE RAILROAD.**—Notice to Contractors.—Proposals in writing will be received at the office of the Atlantic and St. Lawrence Railroad Company, in the city of Portland, until Tuesday, the tenth day of August next, inclusive, at sunset, for the grading, masonry, and bridging of that portion of their road extending from the termination of the second division near the hotel road in Danville, to a place in the vicinity of Norway and Paris cape, a distance of about 20 miles.

Maps, profiles, and specifications will be ready for examination on and after the second day of August next, at the Engineer's office in Portland, where all necessary information will be given.

The company will require, as one of the stipulations of the contract, that the heavier work on any section, shall be first attended to, so that the heavier and lighter work may be completed at nearly the same time.

Persons unknown to the officers of the company must accompany their bids with satisfactory evidence of their ability to execute the work. In all cases good and sufficient bonds with two or more sureties will be required for the faithful performance and fulfillment of the contract.

WM. P. PREBLE, President.

Portland, June 30, 1847.

3:28

**NOTICE TO CONTRACTORS.—SEALED** Proposals will be received until Wednesday, July 15th, in the Borough of Harrisburg, and until Wednesday, July 23d, in the city of Pittsburg, at 10 o'clock A.M., at the Office of the Engineers, for the Grading and Masonry upon fifteen miles of the Pennsylvania Railroad, extending west from Harrisburg, and fifteen miles of said Railroad, extending east from Pittsburg. The grading will include very heavy work, and the amount of Masonry, including the Piers of Abutments of the Bridges across the Susquehanna, three-quarters of a mile in length, will be unusually large. Plans and specifications of the work can be seen at the Engineer's office in each place, for ten days previous to the time appointed for receiving the bids. Any further information can be had upon application to the Chief or Associate Engineers.

S. V. MERRICK, President.

**MICHIGAN CENTRAL RAILROAD.—NOTICE TO CONTRACTORS.**—Proposals will be received by the Subscriber until the 1st of August next, for the Grading of that portion of the Michigan Central Railroad lying between Antwerp and New Buffalo, a distance of 60 miles.

Profiles and specifications will be ready for examination after the 15th day of July next, at the office of the subscriber, or that of Col. J. M. Berrien, at Kalamazoo, at which time the line will be shown to contractors.

J. W. BROOKS, Supt.

Michigan Central Railroad Office,  
6:26 Detroit, June 17, 1847.

**A. & G. RALSTON & CO., NO. 4** South Front St., Philadelphia, Pa.

Have now on hand, for sale, Railroad Iron, viz: 180 tons 2½ x 4 inch Flat Punched Rails, 20 ft. long.  
25 " 2½ x 4 " Flange Iron Rails.  
75 " 1 x 4 " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures.

**PATENT RAILROAD, SHIP AND BOAT** Spikes. The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal Iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

•• Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

**PATENT HAMMERED RAILROAD, SHIP** and Boat Spikes. The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed.

JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y. The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merriitt, New York; J. H. Whitney, do.; E. J. Etting, Philadelphia; Wm. E. Coffin & Co. Boston.

**MACHINE WORKS OF ROGERS,**

Ketchum & Grosvenor, Patterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR, ja45 Paterson, N. J., or 60 Wall street, N. York.

## FRENCH AND BAIRD'S PATENT SPARK ARRESTER.

**TO THOSE INTERESTED IN** Railroads, Railroad Directors and Managers are respectfully invited to examine an improved Spark-Arrester recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger & freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.
